both. In the first place it may be observed that the body is entirely supported between the axles; special attention has been paid to the question of suspension, with the object of providing an easy-riding vehicle. The frame is of channel steel, the side members being narrowed at the extreme front and connected by transverse members, the whole being stiffened at the angles by web plates. The springing of the car is novel, half-elliptic springs being placed fore and aft, and connected underneath the axle at the back and on the top in front. The motor (Fig. 84) is located below the front seat floor board. The cylinders, which are separately cast, are arranged in pairs on the opposite side of the base chamber, the valves being all operated off a single cam shaft. The bore and stroke of both engines is  $4\frac{1}{2}$  in. by  $4\frac{1}{2}$  in. The cam shaft and valve tappets are carried in a detachable case which can be readily removed *en bloc*, as shown in Fig. 84, so giving access to the crank shaft and its big ends. The ignition is by coil and accumulators with syn-

changed the air admission is also varied with the speed of the engine. The action of the governor is regulated by the lever on the steering column, which can be set to give any maximum speed desired, the governor then keeping the car at this speed up and down hill, provided the gradient is not too steep. A pedal on the right acts as a decelerator; when pressed down it acts against the governor, closing the throttle, and decreasing the speed of the car to the utmost possible without stopping the motor; further

Fig. 84.—The N.E.C. Four-Cylinder Horizontal Engine.

In the bottom left-hand corner is seen an underneath view of the detachable cover which carries the cam shaft and the valve tappets, so that not only are these readily accessible, but a large inspection hole to the engine base chamber is provided.

movement of the pedal then applies the main brake. One lever controls the switch, retards the ignition, closes an auxiliary throttle, and brings half compression cams into operation, to facilitate the starting of the engine, which is performed from the driver's seat. When the engine is in operation the lever is moved back to its original position; while to stop the motor it is pushed backwards against a spring, this switching off the ignition and again closing the auxiliary throttle. The lubrication system, which is automatic, is divided into two systems,

Fig. 85.—View of chassis of the N.E.C. Car.

chronised high-tension distributor. The latter is situated at the rear side of the engine at the rear, and is gear driven from the cam shaft. Owing to its proximity to the plugs the high tension leads are very short. The low-tension contact maker is located inside the governor, and is arranged that as the balls of the latter fly out with increased speed of the engine the ignition is automatically advanced. The governor is also so linked up to the carburettor that as the position of the throttle is

one for the cylinders and one for the bearings. Four drips on the dash, which are connected one to each cylinder, are fed by a small valveless pump mounted on the front end of the crank shaft; the pump draws oil from the filter chamber, which lies just in front of the governor case, and delivers it through the hollow crank shaft to all the bearings. The oil then drains to the bottom of the crank case and thence back to the filter. One of the drips on the dash feeds to the filter chamber

can be adjusted to make up for any loss. On the two-speed cars the water is circulated by a pump driven by a continuation of the crank shaft, a fan being provided behind the tubular radiator. On the four-speed cars the water circulation is on the thermo-siphon system, through a honeycomb radiator, the fan being incorporated in the flywheel. The usual bonnet is replaced by the dashboard, which consists of the radiator and a wooden case serving to hold the petrol and oil tanks. The part above the radiator is covered with patent leather, which sweeps

Fig. 86.—Longitudinal and Transverse Sectional Views of N.E.C. Worm Gear-driven Live Axle.

backwards at the sides, giving a very smart appearance. Passing now to the transmission, the two-speed gear is of the epicyclic type and comprises a double-faced leather clutch. When the lever is moved forward the clutch is brought backward into contact with a fixed ring. Part of the epicyclic gear is then held stationary, and the drive passes through the gear, giving the low speed. When the lever is drawn backward the clutch moves forward and makes connection with the flywheel, so giving the direct top speed. In the four-speed gear the forward speeds and the reverse are all operated by one lever working in a "gate." On the top speed the drive is direct, no gear wheels being in mesh. The clutch can be removed without disturbing any other part and all the gears can be taken out without removing the case, or the latter can be removed bodily by undoing four nuts. The transmission from the gearbox to the rear live axle is by a cardan shaft, which has universal joints at both ends, and worm gear, the worm, as will be seen (Fig. 86) engaging with its corresponding wheel below the axle. The latter is entirely encased and runs on ball and roller bearings. The sleeve surrounding the two parts of the divided driving shaft is of steel tubular construction, facing and bolting on to a central cylindrical casting containing the differential and worm drive. The centre portion of the axle is well stayed by stout truss rods extending from the worm casing to the ends of the axles. As already mentioned, special attention has been devoted to the accessibility of the mechanism, every part of which is arranged so that it can be got at from the top or sides of the vehicle. The side panels under the front seat are removable, so exposing the valve caps and the ignition plugs. The front seat and steering wheel are hinged so that they may be turned up out of the way to give access to the engine. The front floor boards and heel board take out in pieces; that under the driver's feet covers the carburettor and the links joining this to the control on the steering column. The flooring on the opposite side covers the governor, the oil filter and the clutch adjustment. As there is nothing to get at underneath the engine, a close-fitting underscreen is fitted, the motor and gear being thus thoroughly protected from dirt. The 15-h.p. car has a wheel base of 9 ft., and the 30-h.p. one of 10 ft. 2 in. The vehicles on view included an Alexandra, the lines of which render it well adapted for use as a town carriage, a six-seated touring car with hood and front glass, and a double landaulet, the finish of which was all in keeping with the high-class construction which characterises the chassis.

#### The British Duplex Motor.

Of the most novel exhibits in the Show, from the engineering point of view, was the 18-20-h.p. chassis displayed by the MOTOR ENGINE AND MANUFACTURING COMPANY, LTD., the interest centreing round the novel two-stroke motor with which it is fitted. We give a sectional view of the new engine in Fig. 87, and may here remark that while only two cylinders are shown in the illustration the engine on the show chassis comprised three cylinders,  $4\frac{1}{2}$  in. bore by 3 in. effective stroke. The method of operation is, however, identical, so that the following description may be taken as applying to both. Each cylinder, it will be seen, contains two chambers of different diameters. It is in the upper ones, B, B', that the expansion of the exploded gases takes place, these being therefore water-cooled. Trunk pistons, A, A', with the

lower ends enlarged, separate the two chambers of each cylinder, three piston rings on the upper end and two on the lower ensuring the necessary tightness. The cranks are set  $180^\circ$  apart, one piston thus being on its up-stroke whilst the other is moving downwards. Assuming the cranks to be in the position shown in the diagram, the cycle of operations takes place in the following sequence as the engine is started up:—In No. 1 cylinder, the one to the left, as the piston A descends it opens both the air valve E', which communicates with the lower chamber C through the transfer pipe G, and also the mixture valve D. The valve F' is held closed both by the suction from the piston A and by the compression from the upward moving piston A' in No. 2 cylinder. A rich mixture is then drawn from the carburettor through the valve D into the chamber C, whilst at the same time pure air is sucked in through the snifting valve E' and down the pipe G. Reaching the bottom of its stroke the piston A commences to ascend, closing both the valves E and D, and compressing the mixture in the chamber C and the air in the pipe G. An operation similar to that just completed in the lower portion of No. 1 cylinder now commences in the lower chamber C' of No. 2 cylinder, the piston A' being on a downward stroke. Directly this pressure can overcome the decreasing compression in the working-chamber B' of No. 2 cylinder, the valve F' opens, admitting under pressure first the cushion of pure air from the pipe G to thoroughly scavenge the cylinder, passing out through the exhaust port H', and then the rich mixture from the chamber C, which can enter only after the pure air above it in the pipe has been displaced. The piston A' commences to ascend, and until it covers the exhaust port H' leakage takes place from the chamber B'; the lower portion of this space being, however, filled only with pure air no fuel is wasted. As soon as the exhaust port is covered by the piston the mixture in the chamber B' is compressed, whilst in No. 1 cylinder the chamber C will again be sucking in air and mixture, and the chamber B scavenged by the air from the transfer pipe G communicating with the lower chamber of No. 2 cylinder. When the piston A' has passed its summit the compressed mixture in the chamber B' is fired, and the motor commences to work. Meanwhile the air-scavenging in No. 1 cylinder having been completed, the mixture pumped in and the exhaust port covered, compression takes place, so that No. 1 cylinder fires just after the working stroke in No. 2 is completed. Alternate firing on every stroke is then maintained by the pumps feeding one or other of the working cylinders on every stroke. It will be seen that the crank case compression usually adopted in two-cylinder motors has been abandoned in favour of an annular pump at the

Fig. 87.—Section of the Duplex Motor.

lower end of the cylinder. Back-firing at high speeds is prevented by providing a means for thoroughly scavenging the cylinder before the new charge of gas is admitted, while leakage of the mixture through the exhaust port is avoided by pumping it in through the top of the cylinder behind a column of air; and, finally, the possibility of a smoky exhaust has been removed by the complete independence of the crank case and working chamber, which are separated from each other, not only by five piston rings, but also by an annular chamber. The three-cylinder engine, which develops 30-h.p. at 1,000 revs. per minute, occupies a space of 24 in. long, by 16 in. wide, by 24 in. deep, so that, compared

with the ordinary four-cycle engine, the new motor occupies only about half the space and weighs at least one-half less per h.p. Another advantage is that it has no cam shaft or valve tappets, the three valves of each cylinder all being automatic, and only one of these is exposed to the full heat of combustion. The reduction in the number of working parts is about ten pieces per cylinder, and as there is no valve movement to be accurately timed and set, or any adjustment whatever to be made, the motor can be easily taken down and fitted up again. By cutting off the mixture supply the engine can be instantaneously transformed into an air-compressor and act as a powerful brake, for on every up-stroke of each piston part of the momentum of the vehicle will be absorbed in compressing a full charge of air. Altogether, the engine forms a striking departure, the progress of which we shall watch with interest.

#### The Argyll Cars.

On their distinctively decorated stand ARGYLLS MOTORS, LTD., made special prominence of their 14-16-h.p. model, which will be their leading production for the 1907 season. The main features that have given the

Fig. 88.—The Argyll 14-16-h.p. Landulet, with the engine under the driver's seat.

car its position among motorists in the past have been retained, with the addition of improvements calculated to perfect the running and reliability of the vehicle. It has, however, been decided to adopt the metal-to-metal clutch, and the use of staggered spoke wheels will be more generally followed, thus contributing to the reliability of the car. The examples of the 14-16-h.p. vehicle on the stand included a standard side-entrance car and a landulet (Fig. 88), both fitted with the Argyll four-cylinder engine. The cylinders are cast separately, with the inlet and exhaust valves on the right and left of the engine respectively. They are operated by vertical lifters from the solid cam-shaft running in special bearing metal bushes. The crank shaft is of strong design, with bearings between each cylinder and specially long bearings at the outer end. Accessibility has not been overlooked in the design. Large plugs are fitted on the cylinder heads and above the valves, while large holes are provided in the crank case to allow of easy inspection and adjustment. Over lubrication is provided against by an arrangement to ensure a constant level of the oil, while the lubrication for the connecting rod ends is on the splash system. The main crank shaft bearings are lubricated from a reservoir on the dashboard by pressure from the exhaust gases. Cooling is effected by a centrifugal pump and honeycomb radiator, with belt driven air inducing fan. The ignition is by accumulator and multiple coils, a specially designed contact maker being fitted, and the speed of the engine is automatically controlled by a centrifugal governor on the cam shaft, acting on the throttle, which latter is also regulated by a lever on the steering wheel. The ignition is also advanced or retarded by another lever on the wheel, and is connected by means of universally jointed rods to the contact maker casing, which can be rotated in either direction to obtain the desired result. A special single jet carburettor is provided. Transmission is through a flexible coupling to the change-speed gear-box of the well-known Govan type; the final drive is by cardan shaft to the rear axle. There are three speeds and reverse. The rear axle is now made with the flanges of the sleeve attached by eight bolts to the differential casing. The foot brake is of the metal-to-metal contracting type, a hand brake of the internal expanding variety being also fitted; the adjustment of the latter is made by the simple tightening up of a long sleeve acting upon right and left handed threaded rods. The frame is of channel steel of strong section, and presents a good example of British workmanship. In addition to the two 14-16-h.p. vehicles, Argylls Motors, Ltd., also showed a 10-12-h.p. two-cylinder car with Aster engine, fitted with a Cape cart hood and glass screen as well as a 16-20-h.p. limousine upholstered in light cloth. The evident intention of the Argyll Company to keep in the front rank of motor-car constructors was testified by the workmanship and design of the vehicles displayed by them.

#### The Premier and Marchand Cars.

The PREMIER MOTOR COMPANY, LTD., exhibited a new 10-12-h.p. two-cylinder car bearing their name. The vehicle, which can be

supplied with either two or four-seated bodies, has been designed to meet the requirements of motorists of moderate means. High tension magneto ignition is fitted, and the cooling is by thermo-syphon, a very large radiator being provided. The lubrication is pressure-fed from the exhaust. The clutch is of the usual cone type, with a ball thrust to take the pressure when declutching. The gear-box gives three speeds forward and a reverse, with a direct drive on the top speed. A cardan shaft transmits the power to the rear live axle, which is of substantial construction, with six rows of ball-bearings. Internal expanding metal-to-metal brakes are provided on the rear wheels. A feature of the frame is that neither a pressed steel nor tubular frame is used; it is of T steel section with an under-frame of similar design. A chassis of the Italian-built 30-40-h.p. Marchand car, for which they are British agents, was also shown by the Premier Company. The engine, which comprises four separate cylinders, is provided with an automatic carburettor and a double ignition system. The change-speed gear is now operated by a lever working in a "gate." Transmission is by side chains, and the rear brakes are of the internal expanding type, while the countershaft brakes, of which there are two, are operated by one pedal.

#### The Peugeot Cars.

An excellent display of Peugeot cars was made by Messrs. FRISWELL, LTD., who inform us, however, that the 1907 models are being reserved for the forthcoming Paris Salon. The cars on view included a 30-40-h.p. landulet, an 18-24 h.p. side-entrance double phaeton, and a 12-16-h.p. double phaeton, with Cape cart hood and glass screen. The 30-40-h.p. car is fitted with a four-cylinder engine, having a bore of 130 mm. and a stroke of 120 mm. All the valves are interchangeable, and the admission and exhaust valves are placed on opposite sides. The ignition is by rotary Simms-Bosch low tension magneto, with make and break inside the cylinders. The change-speed gear gives four speeds forward and a reverse with a direct drive on top. The Baby Friswell two-seated car was also shown. This is fitted with a standard 64-h.p. De Dion engine. The frame is of stamped steel, and is practically a small reproduction of the highest class of automobile built. The ignition is of the ordinary high-tension type, fitted with accumulators and a trembler coil. The gear-box, which is adapted to give three speeds forward and one reverse, is fitted with ball bearings. A feature of the braking system is that the pedal operated brake acts on drums on the rear wheels, the hand brake being on the cardan shaft behind the gear-box.

#### The White Car.

Naturally much interest was evinced in the new models of the White car, which has become a popular town carriage as well as a reliable touring vehicle. For the coming season a 30-h.p. car has been brought out, an illustration of which appears in Fig. 89. Apart from the increased power now obtained the 1907 car has some interesting features and improvements that should serve to carry it still further in the regions of popularity. The generator in the new model has tubes of a larger capacity than previous types, while by adding a feed water heater ten per cent. more efficiency is secured to the power plant. This auxiliary consists of a short coil of pipe connected between the water tank and the generator and located in the exhaust pipe supplying the water at an increased temperature, so adding to the efficiency of condensation. The new engine has been much strengthened and the crankshaft has been newly designed. The two cylinders are of 3 in. and 6 in. diameter respectively, with a 4½ in. stroke. The water pumps are worked by a lever driven from an eccentric on the

Fig. 89.—The White 30-h.p. Steam Car.

crank shaft and projecting at the side of the engine. Consequently the crank case is entirely closed, resulting in improved lubrication and an economy in the use of the oil. We notice that the tubular condenser has been made larger, and the fan is of correspondingly increased size, while the bonnet being in three independent parts facilitates removal when necessary. The fuel tank, now made of two steel stampings, instead of three as heretofore, is hung between the rear of the chassis frame and a cross brace connecting the sides of the same. By means of the float indicator it is possible to ascertain the level of the fuel at any time. Other points of interest consist in the adoption of a tubular front axle, the fitting of longer and heavier springs, and the hanging of the water tank beneath the car. The hand and foot brakes are on the

rear wheels, the latter being an internal expanding brake and the former a contracting brake on the outside of the drum. These are independent of each other and are of undoubted strength. Three good types of bodies were shown on the 30-h.p. chassis, a double phaeton, a limousine, and a landaulet, all thoroughly worthy of the success which recently attended the White steam cars in the town carriage competition, for which they were entered by Mr. Frederic Coleman. We hope shortly to publish a description of the 20-h.p. car which is also to be introduced for the 1907 season.

#### The Reyrol Cars.

Several examples of the little Reyrol two and three-seated cars were shown by the MOTOR SUPPLY COMPANY, LTD. These vehicles, which are designed to meet the requirements of motorists of moderate means, are fitted with either a De Dion 6-h.p. or Buchet 6-8-h.p. engine; the mixture is furnished by an automatic carburettor, and the water circulation is on the thermo-siphon arrangement, no pump being employed. A transverse spring has now been fitted at the rear of the chassis, in addition to the two semi-elliptic side springs. The gear-box provides three speeds and a reverse, and has a direct drive on the top gear, which is an innovation, as are also the torque-rod and the internal expanding brakes on the rear wheels. A new 10-12-h.p. four-cylinder Reyrol car is also being introduced, but unfortunately the company were only able to display the motor of the vehicle. This has the four cylinders all in one casting, the bore being 85 mm. and the stroke 95 mm. The ignition is by magneto, and a feature of the carburettor is that the air inlet and the throttle are controlled by one lever.

#### Argyll Cars.

The Metropolitan representatives for the Argyll cars, ARGYLLS, LONDON, LTD., had an attractive stand in the Annex, whereon they demonstrated the serious attention which the Alexandria Company is

indicating for all the leading types of cars in use in Europe is sufficient indication of their merit to many motorists. At the Exhibition special attention was directed to their model de luxe combined speed indicator and communicator, by means of which the passenger may transmit instructions to the driver, and eight-day watch, the whole being fitted in an extremely good type of case, making an attractive provision for the car. The accuracy, durability and clear reading of this speedometer have long been appreciated while a previous description in the *M.C.J.* obviates the necessity for lengthened reference on the present occasion. The firm also showed their milometer as intended for attachment to the hub cap as well as in a new form for fixing to the dashboard. In "Communicators" a handsome new circular pattern was exhibited, while electric side lamps, steering column lamps and portable inspection lamps were included in a very representative display.

#### Coachwork.

Several examples of high-grade coachwork were on view, a pleasing instance of the excellence of British production in this respect being given by Messrs. SAYERS AND CO., of 90 and 92, Wandsworth Road, S.E., whose *debut* at the Agricultural Hall exhibition in the spring gave them a splendid introduction to the motor-car industry. They showed a limousine body to seat five persons and with a sliding luggage grid at the rear; a touring landaulet with "Sayerico" seats and tyre brackets of the same name; a phaeton body showing the adaptation of the Windham detachable body which we have previously illustrated in our columns; and an extension hood capable of being brought into use in a really quick space of time. The harmonious colour schemes introduced into the upholstery as well as the woodwork of the cars gave great attraction to Messrs. Sayers and Co.'s exhibits. At their stand was also to be seen the "Saverico" folding ladder intended for the conveni-

Fig. 80.—Plan of Chassis of Deasy 24-h.p. Car. (See page 897).

now giving to broughams, landaulets and closed carriages generally. The 26-30-h.p. car with limousine body by Mulliner, of Northampton, was a conspicuous example of carriage work, the fitting and upholstery, from the adjustable skylight ventilator in the roof to the minor accessories provided throughout the car, being of high grade. It has accommodation for five passengers. From the coach-building point of view, equal interest attached to the three-quarter landaulet body fitted on a 16-20-h.p. chassis. This had a detachable canopy and sliding wind shield, while all the pillars are hinged so that the vehicle can be readily converted to an open carriage. Both cars were fitted with a four-cylinder Aster engine of 26-30-h.p. and 16-20-h.p. respectively. Transmission is by cardan shaft to a live axle, and the Govan patent three-speed gear is fitted. The clutch is of the metal-to-metal type, which is now being provided on Argyll cars. Other models on the stand included a 14-16-h.p. landaulet with four-cylinder Argyll engine, in which the motor is located directly under the driver's seat, by which means the wheelbase has been shortened about 3 ft. 6 in., with consequent advantage in congested traffic, and a 16-20-h.p. chassis with Aster engine and provided with a side-entrance touring body, Cape hood and sliding canopy, allowing the ready conversion of the vehicle to an open carriage. Upon the stand was a polished chassis, fitted with a four-cylinder 14-16-h.p. engine, two of the cylinders of which were cut away and the gear-box opened out to allow of public inspection.

#### Smith's Indicators.

The fact that Messrs. S. SMITH AND SON, LTD., have in the course of the last eighteen months supplied over 5,000 of their speed

ence of loading luggage on the roof of covered cars without damaging the carriage by clambering on to the top, in the usual way. It folds up very compactly, and forms a useful adjunct to the accessories carried when on tour.

#### The Turquand Tyre Flange.

At the stand of the AUTOLOC SYNDICATE, LTD., was the speciality of the Turquand Tyre Rim Company, of 1, Broad Street Buildings, E.C. The Turquand twin tyre flange is easily attached or detached, and can be fixed to any artillery wheel carrying any type of beaded edge tyre. In fixing the new flange one of the beads of the existing standard tyre rim is removed and T headed bolts are fixed laterally through the wood felloe with the heads slightly projecting. These bolts are secured by means of helicoid safety nuts. A side-flange is provided carrying a bead to the exact section of the piece removed, and also containing slots to slip over the heads of the bolts. A covering ring is also provided in the form of a D shaped steel tube and containing slots in its flat portion. The combination of the two rings secures the strength of the device. The flange plate takes the circumferential strain, and the tubular covering ring adds to the lateral strength and rigidity of the wheel. The security of the attachment has been well provided for, and the Turquand flange certainly ranked amongst the novelties of the Show.

#### Lamps.

Messrs. HOWES AND BURLEY, LTD., gave ample illustration of their capacity to provide motorists with lamps of pleasing appearance as well as of good structural work. Their acetylene head lamps for the coming season are being placed on the market in three types

viz., with removable generator, separate generator, and entirely self-contained. In the side and tail lamps a new patent automatic fixing for the oil reservoir gives additional security in a lamp that has been well received since it was first placed on the market. Among the other lamps which formed a large section of this firm's display of accessories, including motor body builders' ironmongery, were brougham lamps, interchangeable for acetylene or candle.

#### The Goodrich Non-Skid.

The Goodrich all-rubber non-skid band was exhibited by B. F. GOODRICH AND CO., the special feature of the device being that the studs are of rubber, thus adding to the resiliency of the tyre and prolonging its life. The new tread can be fitted to any existing tyre, and will doubtless attract the notice of those looking for a non-skid band that will not slacken the speed of the car. The firm's tyres for motor-cars as well as for the heavier type of vehicles were also shown.

#### The Hutchinson Tyre.

Recently we referred to the Hutchinson tyre as one that had become recognised in France as of considerable merit, and its advent to the Show was a matter of more than ordinary interest. The tyre is of the familiar beaded edge pattern, a substantial tread of good quality of rubber being an element in its durability. Both rubber and fabric employed are of high grade, and ESTABLISSEMENTS HUTCHINSON should have many inquiries at their London office, 13, Maddox Street, W.

#### Autoloc Syndicate.

The AUTOLOC SYNDICATE, LTD., whose specialities attracted considerable attention at the exhibition where first shown last spring, showed their system of steering-wheel control and also their extra air valve control levers. The Hamilton carburettor and the radiator of the same name were also on view as well as the Turquand detachable flange. Another novelty at the stand of the Autoloc Syndicate, Ltd., was the Hopewell tyre case. This is of leather and has a cord at one end and a metallic cable at the other. These are drawn together and fastened in such a way that a good appearance is obtained, while an effectual security is ensured.

#### Bodymakers' Furniture.

MESSRS. FREDERIC SELBY AND COMPANY took the opportunity of making known their capabilities for the production of fittings, &c., for the coachwork of automobiles, and demonstrated an all-round excellence of workmanship. Axles and springs were an important section of the exhibit, while the selection of wind screens and Cape hoods was of interest. Included amongst these specialities was a Cape hood for a two-seated car, the ease of the adjustment of which constitutes an admirable feature. Door locks, handles, hinges, &c., turn buttons, steps, and other similar items of furniture for motor-bodies, completed Messrs. Selby and Co.'s range of exhibits.

#### Accessories.

MESSRS. G. T. RICHES AND COMPANY may always be relied upon to have an exhibit thoroughly representative of the accessory branch of the automobile trade. Among the minor matters included therein was French chalk, put up in tins with revolving perforated lids. The Pumiss soap, recently noted in the *M.C.J.*, also attracted some attention, as well as the loose canvas gloves, the advantage of which is apparent when dirty jobs have to be undertaken on the car. They also showed a lamp for fixing on the steering column for the illumination of the dashboard, and a number of accessories of very varied extent, the specialities including Plaxine. The Eisemann magneto, with which the firm's name has long been identified in this country, was also on view.

#### Elastes.

Considerable interest was shown in the new substance known as Elastex, which was shown by the ELASTES COMPANY on the Wolseley Company's stand. Elastex is an artificial rubber manufactured from chromic acid, glycerine and gelatine by a special process. When originally prepared it is in a liquid form, but gradually it sets into a stable and extremely resilient substance which is neither affected by water nor by any reasonable changes of temperature. Although the new substance can be employed in many ways in place of rubber, the company are at present devoting attention to popularising its use in place of air in the inner tubes of motor tyres, so rendering them equally free from puncture troubles as a solid tyre whilst retaining all the advantages in the way of resiliency of the pneumatic. The compound is forced through the ordinary air valve into the inner tube of a motor-car tyre fitted in its outer cover and mounted on a rim. The proportions of the ingredients and the pressure with which it is forced into the tube vary according to the weight, horse-power, and speed of the car for which it is destined. The tyre having thus been filled and properly distended is put aside for some days to allow the substance to set. Tyres filled with Elastex have been in use in France for some time past, and a few vehicles have also been running with them in this country, the success achieved having resulted in the formation of an important company to develop the idea in England.

#### Stevens Engines.

Mr. E. J. Hardy's exhibit included a well-made example of the engines of the STEVENS MOTOR MANUFACTURING COMPANY, LTD. These are made in 6-h.p., 7.8-h.p., 8-10-h.p., with twin-cylinders, the four-cylinder engines being of 16-18-h.p. With regard to the general details of these engines, we note that the Longuemare carburettor is usually fitted. The pumps are gear driven from the main shaft. The

wipe contact makers are operated by bevel wheels from the cam shaft. Mechanically-operated valves are provided, and the fly-wheels are tapered to take the usual leather-faced cone clutch. The bore and stroke of the 6-h.p. engine is 81 by 89 mm. and that of the 16-18-h.p. motor 92 mm. by 102 mm., this developing its full power at 1,100-1,200 revs. The crankshaft of this model has a disc  $4\frac{1}{2}$  in. diameter for bolting to the fly-wheel. All the engines are well constructed, the crankshafts being of a fine grade of nickel steel and the bearings of phosphor bronze of a high quality.

#### The Gratz Specialities.

Since its introduction to the public at one of the Agricultural Hall Shows the Gratz speed indicator has attained considerable distinction in the automobile world, where its accuracy and durability have been appreciated. The instrument possesses a pointer clamp by which the hand may be fixed at the speed the car is travelling at any particular moment, thus affording a silent but effective witness should the police attempt to give false evidence against the motorist who is unfortunate enough to come within their clutches. A mileage recorder can also be attached to this British instrument, the new model of which is of extremely neat appearance. The GRATZ PATENTS, LTD., by whom the speed indicator is made, had several other good accessories on view. We were shown the model of a new jack about to be placed on the market, which merits trial for those anxious to keep their equipment thoroughly up to date. In a cylinder standing on a firm base about ten inches high, with a diameter of nearly three inches, is placed another cylinder which is inverted and which is extended by the pressure of air pumped by an ordinary tyre pump. Once inflated the supply of air can be retained until the opening of a cock allows for its escape and the return of the inner cylinder entirely within the outer one. An electric horn, which will emit a strong sound, on a four volt battery, was also on view, as well as a good selection of electrical accessories, including the Gratz Plate accumulator. In the positive plates of this type there is no paste to disintegrate in active use. They are moulded with fine

Fig. 91.—The Gratz Distributor.

intersections in blue lead and then dipped in chemicals to secure a certain degree of porosity. The peroxide is deposited by electrolytic action until the cavities are filled and the lead, with the exception of the central core, becomes an active and hard material. Equal care is taken to secure the compact character and hardness of the negative plates, so that the accumulator is not subject to the disintegration, sulphating and other undesirable conditions sometimes occurring in accumulators. A good type of spring ball contact maker and the combined current distributor and contact maker, shown about one-third of its full size in Fig. 91, were also of considerable interest. The current passes to the terminals through the medium of a steel ball resting in a small metal cup. The latter is held in position by a spring, which is compressed when contact is made, so that both a mechanical and electrical contact follows. Absolute synchronism in the running of the motor will be assured by its use, while the interchangeability of the parts and their easy detachment are points not without value.

#### The "Gaulois" Tyres.

A special feature of the display of the GAULOIS TYRES, LTD., was the "Gaulois-Agrippa" non-skid covers, which were shown in standard sizes and sections. A new tyre known as the "Gaulois special tourist" tyre, with toughened rubber tread, was on view. The strength of the Gaulois tyre is ensured by the system of construction. The air tube is made in three layers, the point of each separate layer falling at a different point in the circumference, preventing any leak penetrating. This, combined with the outer cover with toughened rubber, made a most durable combination. Among the literature circulated from this stand was a booklet on the "Care of Tyres," admirably written by Mr. F. J. J. Glynn, the manager of Gaulois Tyres, Ltd., whose extended knowledge of the subject is now placed at the service of motorists.

#### Imperial Tyres.

The IMPERIAL TYRE AND RUBBER COMPANY, LTD., showed their Imperial tyres, both of the pneumatic and solid types. The pneumatic

tyres for motor-cars are made with a toughened tread, which should be a material point in increasing their life, while the high grade of rubber employed in their manufacture is another contributory merit. The company make a speciality of repairing all types of motor-car tyres and tubes and fit non-skids of all designs. Their facilities of production enable them to do all kinds of fitting solid tyres or the reconstruction of wheels.

#### E.I.C. Specialities.

The ELECTRIC IGNITION COMPANY, LTD., had their generative set in two sizes, one for pleasure cars and one for motor-buses. This generative set consists of a specially designed generator driven by the engine, and keeps the accumulators fully charged, so ensuring lights for lighting up omnibuses, broughams, &c., and at the same time provides for the ignition and the current for electric horns. A type of switch enabling accumulator or magneto ignition to be used at will, and a complete range of accumulators, coils, sparking plugs, distributors, &c., comprised the interesting exhibit of this company. The E.I.C. Mica plug has become a standard article, the fact that the patent tapered insulator is in one piece being an important point. This is automatically locked tighter by every explosion of the engine, and it is claimed to be impossible for it to short circuit. The E.I.C. coils have done well in many important races—a fact that was brought well home to motorists during the show.

#### The Palmer Tyre.

Now that important concession with regard to price has been made in connection with the Palmer tyres, additional interest is likely to be attracted to this type during the coming season. In the works of the Palmer Tyre, Ltd., new labour-saving machinery has been installed, and the advantage in cost is now shared with the users of these standard tyres. No new departure in construction has been made, but some innovations with regard to the sizes give occasion for comment. A new 6 in. tyre with ribbed non-slipping tread is a special feature for the new season and is suitable for loads up to one ton per wheel, while a similar tyre adapted for the flange fixing method of attachment is to be put upon the market. The company recommend flange fixing for heavy and powerful cars. In this, the beads are supported throughout their entire circumference on both the inside and outside edges. The attachment is a purely mechanical one which does not depend upon the air pressure within the tyre, and the device is not likely to become detached from the wheel as the result of a sudden deflation, even should the car be rounding a corner at a high speed. A new tyre pressure gauge was also shown on the stand.

#### Miscellaneous.

Messrs. ROTHERHAM AND SONS had a selection of lubricators, &c., including automatic feed lubricators with tank for use on the dashboard of cars. A complete selection of petrol filters, needle valves, taps of all kinds, and similar accessories made up a useful display.

The Cowey patent extension speed indicator, made by the COWEY ENGINEERING CO., LTD., of Kew Gardens, is guaranteed for twelve months, so confident are the makers in its durability and accuracy. In the Extension Speed Indicator there is a speed indicator on the dashboard, an extension dial being also fitted inside the car and in full view of the other occupants than the driver. The speeds are indicated on both dials, the connection between the two consisting of a small cord of an eighth of an inch in diameter, which may be led to any convenient point in the interior of the car. The features of the Cowey Indicator are well known, and it remains only to be said that with the help of this extension the passenger in the car can observe the speed at which it is travelling—an important point, should the recommendation of the Commission with regard to the liability of the owner of the car be enforced.

Messrs. J. C. FULLER AND SON, of Bow, E., made a feature of their High Tension Magneto, and showed a full range of coils for multi-cylinder engines with wipe contacts, and for synchronised high tension ignition, including a powerful coil for synchronised ignition, giving a 2-inch spark. In accumulators they had a complete range of sizes for motor-cars in 2, 4 and 6 volt series. Attention was also drawn to their moto-capsule batteries, which are a form of dry cell for carrying on the car for emergency, and also their charging sets.

In addition to the Victoria resilient wheel which was shown on their stand, Messrs. H. M. HOBSON, LTD., had the Pognon plug, Bougie switches and Jenatz tyres. The plugs are now fitted on many cars of the best type and may be relied upon to give satisfaction to users. The Bougie switch is of service in testing the engine and should be found among the adjuncts on all cars.

Among the tailors represented were Messrs. DRYKITT, LTD., who have taken up the sale of the Robeson patent driving coat, which made its debut to the motoring world at the Cordingley Motor Show. They have a good assortment of ladies' and gentlemen's driving coats in frieze, leather, and waterproof coats. Umbrella coats were also among the exhibits.

A display of motor-car body timber was made by Messrs. JOSEPH OWEN AND SONS, LTD., whose long experience in the wood trade gives them exceptional opportunities for suiting the requirements of makers of automobiles. Bent ash and hickory rime, hickory and oak spokes, wings, panels and thoroughly seasoned ash, birch wood, white wood, etc., for body work were included in an interesting collection of timber.

The "De Nevers" tyres of Messrs. G. LIVERSIDGE AND SON, LTD., have stood the test of experience, the construction giving a combination of the advantages of solid with pneumatic tyres. At certain intervals in the rubber tyre transverse grooves are cut from the surface, so that

when under pressure the rubber can extend, securing that no resiliency is lost. The grooves take up any elongation that occurs and enable the tyre to get a grip of the road in greasy weather. The "De Nevers" tyre has all the elements of durability, and many well-known motorists are recognising its good parts.

Messrs. BRAMPTON BROS. were represented by a selection of their chains for motor-cars, the merits of which have been demonstrated during the development of the motor-car industry.

M. ANDRE GODIN had a good display of the well-known Ducellier motor lamps as well as of the "Dinin" accumulators and other electrical devices, including the "Hydra" high tension magneto. The new Oxy-etherique "Ducellier" light was an attractive exhibit, the admirable features of which will be illustrated in our columns at a later date.

A display of accessories and Panhard parts was made by Messrs. PANHARD AND LEVASSOR, whose Acton Vale works are replete with everything necessary for repair work. There they undertake to despatch Panhard parts by return, to lengthen the chassis of short cars to take side-entrance bodies, and, in fact, generally overhaul automobiles. A minor, yet important, section of their activity is the repair and testing of Eisemann magnetos.

The GENERAL PETROLEUM COMPANY, LTD., drew much attention to their "Shell" spirit, the good results obtained with which have been generally attested by many well-known motor experts who have adopted this grade of petrol.

Several good tools were shown by Messrs. W. H. WILLCOX AND COMPANY, LTD., including the "Murray" force feed lubricator, and various patterns of jacks, gauges, circulating pumps, &c. In greases and oils, as well as lubricators and feeders, the display was complete, and of interest to all concerned in that important branch of automobilism. Messrs. ROSS, COURTNEY AND COMPANY, LTD., had a collection of their pumps, bolts and nuts, lubricators, screw terminals and other specialities for motorists, a feature being made of the "Timesaver," this being a double-barrel pump for use in garages, &c.

Messrs. LUDW. LOEWE AND COMPANY, LTD., showed the D. W. M. ball bearings, which are made of steel by the "Cleveland New Process," and the balls being gauged by a patented process are guaranteed of absolute uniformity in diameter.

A new tyre pump worked from the engine was shown at the stand occupied by Messrs. J. E. HUTTON, LTD., in the Gallery, whereon was a comprehensive selection of spare parts and accessories for all classes of automobiles.

THE COVENTRY CHAIN COMPANY, LTD., showed a fine selection of chains for automobiles, from a small gear chain with a light breaking strain, to a 2½ in. pitch motor lorry chain with a breaking load of 63,000 lbs. Attention was being directed to the special type of chain in which the bushes are made integral with the side plates, thereby ensuring that all stretch must be due to actual wear and tear. The chain lubricant bath was also brought to the notice of motorists during the Exhibition.

THE VACUUM OIL COMPANY, LTD., showed their various descriptions of automobile lubricants, including "Vacuum mobiloils" for petrol, steam, and electric vehicles. Vacuum graphite grease for chains and the company's semi-solid lubricant known as "mobilubricant" were among the specialities included in an attractive show of very necessary adjuncts to the successful running of the motor-car.

Messrs. G. DAVENPORT AND COMPANY were represented by the "Imperial" axle odometer, which gives the total mileage run, thus affording, as the makers point out, a check on the consumption of petrol, and an opportunity of gauging the life of tyres. The device is made for any size wheel, is very strong in construction, and does not project beyond the hub cap, being fitted on the steering arm. Combined watch and speed indicators, the "Imperial" motor watches, petrol gauges, hydrometers, and dashboard lamps contributed to a very interesting display.

Messrs. SAWYER AND COMPANY devoted their space to the representation of the Sawyer non-skid band. This is of the detachable type, the band being of a good quality of chrome leather. It can be fitted with steel studs or, where preferred, washers and rivets. Experience has given the Sawyer band a good place among such devices.

Mr. E. EICHHORN'S display included many good lines of automobile accessories, in which were conspicuous the "Perfecta" lamps and horns as well as the Mez goggles.

Complete selections of motor-car accessories and parts were shown by Messrs. BRANSON, KENT AND CO., LTD. The "Darop" plug was a leading line among the various B. K. specialities on view. Longuemare carburetors, Basse and Michel coils and accumulators, and several good types of lamps were comprised in the exhibit.

The "Perfect Detachable" tyre which Messrs. DAVID MOSELEY AND SONS, LTD., introduced to lessen the worries of motorists when on the road was shown in the Gallery, as well as being fitted to many cars on the ground floor. In this the cover is kept in position by a locking ring which passes over the lip of the flange.

In the accessory section of the exhibition the SIMMS MANUFACTURING COMPANY, LTD., showed a range of Simms engines from the 2½-h.p. air-cooled type to the 100-h.p. water cooled four-cylinder motor. All the exhibits were fitted with the Simms-Bosch magneto-ignition, some on the high tension and others on the low tension system. The Simms safety buffer, designed to avert the full shock of collision, was also on view.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### THE MOTORING AND THE NON-MOTORING PUBLIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Chief Commissioner of Police for the Metropolis has published recently his annual report showing the number of fatal accidents occurring in the streets of London last year. The number of people killed by carts, vans, and horse-omnibuses, which may be taken to represent the slow-going traffic, during the year was 110. The number of people killed by motor-cars, including motor-omnibuses, was twenty-two. These figures show, as exact statistics have always made clear, that fast vehicles like cycles and motor-cars cause the fewest fatal accidents, and that slow moving vehicles like vans cause the most. Control, ease of steering, power to stop quickly, these are the things that make for public safety. Speed is one of the least important of the factors.

Exact comparison between various classes of vehicles should be on the basis of the aggregate number of miles travelled. Figures collected for the Royal Commission on Motor Cars showed that 2,515 motor-car owners, who had travelled in the aggregate 44,352,312 miles, had caused accidentally the death of sixteen persons, an average of 0.3 persons per ten thousand miles travelled. So far as has been found possible to obtain comparative figures they show that the above percentage of accidents is very much less than by any other class of road vehicle.

These facts will enable your readers to judge properly the attempts that are being made by a body calling itself the Highways Protection League, by misleading or incomplete statements, to discount the report of the Royal Commission on Motor Cars, and induce the non-motoring public to join in an agitation for restrictive legislation directed at motor vehicles.

A letter has been circulated from this tainted source containing an alarming list of fifty "victims" of the motor-car during August, September, and October.

Fortunately, the Motor Union carefully records all fatal motor accidents, with the object of ascertaining whether it is possible for the Union to take any further steps to render the motor-car—already proved to be the safest vehicle using the public roads—still more safe. A comparison of this list with the list printed in the dailies shows some discrepancies. The Motor Union have, on previous occasions, found, on investigation, that circumstantial accounts of fatal accidents alleged to have been caused by motor-cars were absolute fabrications. In the present cases, enquiries were at once set on foot, and it may interest your readers to know the results.

In the "scare" list fatal accidents are stated to have occurred at Tavistock, Esher, and Cradley, during the three months. The Superintendent of Police at Tavistock writes denying that any person has been killed at Tavistock. The Superintendent of Police at Esher writes that no person has been killed at Esher in a motor accident during the present year. The Police Sergeant at Cradley writes that no fatal accident has occurred at Cradley, Cradley Heath. Enquiries are now being made as to whether such an accident has happened at any other place called Cradley.

Another fact that might very properly have been brought out in the "scare" letter is that in five cases the person killed was an occupant of the car. The implied suggestion is that all the "victims" were members of the non-motoring public.

The real question, however, is the responsibility of the motorist for the deaths reported. From the analysis of the verdicts of the coroners' juries in the cases of which I have been able to obtain particulars, it appears that, with two exceptions, the verdict was one of "accidental death," and the drivers of the cars were exonerated from blame. In the first exception, an occupant of a car was killed through the overturning of the car, and the jury in this case found that it was being driven at an excessive speed. In the second case the jury returned an open verdict, and the matter is now being taken further by the police authorities.

It would appear, therefore, from this analysis, that only in two cases included in the list has it been found, on judicial investigation, that the driver of the car was responsible for the accident.

The Motor Union has, during the past few months, prosecuted and obtained convictions in five cases of assault upon members of the public legitimately using the public roads. It has prosecuted and obtained convictions in five cases of wilful obstruction upon the King's highway. It has, in co-operation with the police and the education authorities, given an effective check to the dangerous practice of throwing stones at travellers upon the roads. In association with the A.C.G.B.I., it is arranging, at a cost of some £500, for a competition designed to reduce the cost of making our roads dustless. In many other ways it is striving to better and cheapen the motor-car, so as to bring it and the enjoyment and use of our common roads within the means of the majority of the British public. Compare this real highways protection work with the efforts of a body of prejudiced men, who,

masquerading under the title of the Highways Protection League, seek to inflame public opinion against the motor vehicle, and by increasing restrictions, fines, and taxes, effectively to place the motor car beyond the means of many who desire to use and profit by it.—Yours truly,

W. REES JEFFREYS.

### SOLID TYRE EXPERIENCES INVITED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers tell me from personal experience whether it would answer to run a 10-h.p. Panhard on solid tyres, and if so, what are the most satisfactory solids to fit? The roads in my district are very hard on tyres, and the trouble and expense of pneumatics are great. I am told that with solids a speed of sixteen miles per hour cannot be exceeded with comfort, and that the wear and tear to the car will greatly exceed any saving in tyre bill. Is this the case? I do not mind sacrificing some speed to immunity from puncture.—Yours truly,

TRAMP.

### AN EARLY ELECTRICAL MOTOR-BUS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I enclose herewith a copy of the only existing photograph of the electric omnibus designed by me in 1889-90. The vehicle was completed in 1891, nearly sixteen years ago, having been built to my designs

by the Electric Construction Corporation, of Wolverhampton, where Mr. Thomas Parker, jun., assisted in its construction. This omnibus, which was constructed for twenty-six passengers, was the first mechanically propelled vehicle of any sort licensed by Scotland Yard to ply for hire, and subsequently plied between Charing Cross and Victoria Stations, the fare being one penny. It was driven by two large electric motors coupled by reducing gear comprising a chain drive both to the rear and to the front axles. The photo was taken before the body-work was quite completed; for instance, only two of the garden seats were fixed.—Yours truly,

W. C. BERSEY.

### MOTORING IN THE NEW FOREST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been instructed by the official Verderer and the Verderer of the New Forest, sitting in their Court of Swainmote and Attachment for the New Forest, at the Verderers' Hall, in the King's House, Lyndhurst, on the 19th ult., to state that the correspondence which has recently passed between Lord Montagu and myself relating to the danger of driving motor-cars through the New Forest has been read to the court.

You are probably aware that my letter of November 28th 1904, addressed to the secretary of the Automobile Club, was written in consequence of several cases having occurred of certain commonable animals lawfully depasturing within the perambulation of the New Forest having been run down by night by motor-cars and killed, and it was pointed out in my letter that animals whilst lawfully depasturing

were in the habit of frequently crossing and re-crossing the roads and grazing by the sides of the highways, and even of lying down on and at the sides of the roads.

At the present time it is believed that the majority of motorists are not aware of the peculiar condition of things existing in the New Forest, and of the fact that ponies, cattle and pigs may at any time be met with in the act of crossing the roads, nor do motorists realise that the open Forest roads are unfenced and are to a very great extent bounded by thickets of bushes and trees which naturally conceal any animals depasturing near thereto, with the result that on the rapid approach of motor-cars, with their accompanying powerful lights, these animals are startled and run across and along the roads immediately in front of the cars, and unless great caution and care is exercised by drivers (especially by those who are unacquainted with the habit of Forest animals) fatal accidents are bound to occur.

It is a very good rule when approaching ponies in the Forest to notice whether the foals are near their mothers. If they are not, extra caution should be displayed, as, at the last moment, as the car approaches, the young animals are likely to attempt to cross the road to rejoin their mothers, and a collision may very likely then take place.

The Court of Verderers are desirous that every publicity should be given to the risks which are attended by motoring at high speed through the Forest, in the hope that such accidents as are referred to may be minimised as far as possible; and when it is borne in mind that the animals that roam in the Forest are for the most part the property of commoners

not mean to say that by fixing speed accidents are going to be prevented, but the consequences would perhaps not be so serious. It wants some believing, after a mishap has taken place, that the speed was only say fifteen miles per hour, when the car is smashed out of all recognition. I shall use all my influence to put down the scorching motorist, even if the driver has enough certificates to make a suit of. Owners of high-powered cars must not forget that what is sport to them is a nuisance to other people, and if they can afford to risk a car costing, say, from £800 to £1,500 in tearing along at illegal speeds, I should suggest that they could find a better use for their money.—Yours truly,

W. J. W., A 1299.

#### TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your correspondent, Mr. A. J. McKinney, allow me to point out that the examination of the person about to drive in France is not for the "Permis de Circulation;" the car in question is examined for this permit, which is, as the phrase signifies, to permit the car to "circulate" on the roads of France. The examination of the driver is for him to obtain the "Permis de Conduire," which is practically equivalent to the English driving licence. I cannot understand how it was that your correspondent had to pay 20 francs for his permis de circulation. I quite concur with Mr. McKinney that the idea is good in examining those who purpose to drive, but of course the stringency with which the examination is conducted will naturally vary according to the individual examining. I am glad that your corre-

Motoring in Spain.—The Summit of the Pass between Old and New Castile.

[From "The Car of Destiny."]

who can ill afford to sustain any loss, and that such accidents tend to create a feeling of hostility towards motorists, it is hoped that the utmost caution and care both by day and night will be exercised by the drivers of motor-cars when passing through the New Forest, and that no further damage will be caused to the commoners' animals.—Yours truly,

MONTAGUE CHANDLER,

Clerk to the Verderers of the New Forest.

#### THE QUESTION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I must differ from "A. A. L. H." on the above subject. I cannot see that the French system would be anything but a worry to us. The larger portion of motor accidents are only too plainly due to excessive speed. From your correspondent's letter I take it that after a driver has passed some so-called test he is to be allowed to go the pace his fancy demands. It is but poor solace to the victim to know that he has been run down by an up-to-date motor-car fitted with all the latest improvements and driven by a gold medal driver. The arrangement of handing a certificate to the police, as proposed by "A. A. L. H.," would be voted by most would-be motorists as a bit of a nuisance, and would, I should think, cause a lot of trouble when selling or buying a second-hand car. Finally, I consider it a positive danger to allow such powerful machines on the highway, as the most skilful driver is subject to momentary fits of forgetfulness, with grave results to all concerned, and I have no doubt many accidents have been caused by a sudden failure of brain power due to the excessive strain on the nerves. I do

spondent agrees with me as regards the arrangements of the English driving licencing process.—Yours truly,

ALAN A. L. HICKMAN.

#### THE LIMITATION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motorists are only human, and with machines in their possession capable of a speed up to forty-five miles an hour, it is expecting too much of them that they should confine themselves to twenty or less. In my opinion the only remedy for reckless and excessive speed is for the Legislature to pass a measure which, among other regulations, would refuse licences to travel on the public highways to vehicles capable of exceeding the legal maximum, and thus check the increasing monopoly of the roads and the great injury to the surface which high-speed motor-cars are inflicting on the public, and restore the free use of the highways and byways to all.—Yours truly,

P. J. KING.

#### THREE SPEEDS OR FOUR?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There seems little doubt, after a careful examination of the Olympia Show, as to the popularity of four speeds. Three speeds have been very generally employed the last year or so, owing to the great advances made in engine control. Motors could be run to possibly from about 100 revolutions per minute up to 1,500 or 2,000, and three speeds

were considered enough, the third speed being, of course, a direct drive, and consequently most of the running was done on it. A few firms, including one large English maker, still adhere to this principle, but others have been alive to the difficulty. For a driver who was contented not to "push" his car unduly, either on the level or downhill, the three-speed arrangement was admirable, but otherwise it is not a happy one, nor is it conducive to long life of the motor. If the three-speed car is geared to take its full load up ordinary hills without changing speed, it stands to reason that on the level or downhill it will "have some in hand," and, if allowed, the engine will commence to "race." People have been so easily deceived by that alluring advertisement, "climbs everything on top speed," which in reality only proves that the car is so geared that it can take ordinary hills on its top, just the same as a four-speed car is geared to take them on its third. Apparently the majority of good makers have found out the disadvantages of the three speeds only, for several are now fitting a fourth, or, still better, are arranging a direct third and a geared fourth, which is an admirable arrangement, and has really no objection, except, perhaps, the additional complication, if it can be called such, in the gear-box.—Yours truly,

FOUR-SPEEDER.

### THE SIDE-SLIP PREVENTION COMPETITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is gratifying to find a side-slip prevention competition is to be held, although the authority conducting the same may not be regarded as wholly authoritative, seeing that the A.C.G.B.I. is more generally associated with pleasure cars than with 'buses. The existence of the Society of Motor 'Bus Engineers seems to have been overlooked in the matter.

There is one clause in the rules which seems not only unnecessary but unwise. Drawings are to be submitted and "only those devices which, in the opinion of the judges, are suitable will be put to a practical test." This surely is hampering inventors unnecessarily. The judges cannot know everything, and their view of suitability without seeing the appliance actually at work may rule out of the test many meritorious devices that might secure their purpose, although of a form unfamiliar to the judges.—Yours truly,

W. WALKER.

### AIDING AND ABETTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your report on Mr. Harvey Du Cros' appeal case, if it is to be the case that any passenger in a car, if he has had any automobile experience, may be convicted of "aiding and abetting" an offending driver, it opens up a vista of terrors against all and sundry who ride in motor-cars. For instance, let us suppose that an experienced driver is sitting with a driver who has charge of the car, but has had little or no experience, it will become the natural thing for the experienced driver to be summoned for aiding and abetting the offending driver, although very possibly he has nothing whatever to do with the latter's driving. Please convey my sympathy, through your columns, to Mr. Harvey Du Cros in this very English method of dealing with automobiles in courts of so-called justice.—Yours truly,

A. L. H.

### CLUTCH TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The clutch of my engine is of the leather-faced cone type, normally held in engagement by a coil spring and is released by the action of a pedal. The clutch has been slipping badly of late, and I have tried the application of all of the substances of which I have heard to prevent this. I should be glad if you or any reader of the *M.C.J.* could assist me in ascertaining if the trouble is with the leather or with the spring? I think perhaps the latter is not sufficiently strong to properly wedge the cone into the engine flywheel.—Yours truly,

R. FRASER.

[Our correspondent's trouble is very probably due to the leather becoming worn, allowing the rivets to stand flush with the face of the leather, or perhaps being worn sufficient to allow the inner face of the clutch to touch the flywheel. It would be advisable to ascertain if this is the case, as it would be useless treating the leather if it is so worn as to allow either of the above to happen. A good dressing for a leather clutch is 50 per cent. castor oil and paraffin, or, if it is found to slip, a little Fuller's earth or French chalk may be applied.]

### EXPERIMENTS WITH COMPRESSED ACETYLENE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was extremely interested to read Mr. Jarrott's letter regarding the dissolved acetylene supplied by the Acetylene Illuminating Co., and can only endorse every word that Mr. Jarrott writes. I have been using this apparatus for some time past on my car, and can only say that nothing on earth would induce me to go back to the old-fashioned generator and its attendant troubles, with such an invention

as this on the market. I find that it gives a very much steadier and clearer light than any generator, and as a sort of test I have used four different types of headlights, and found that it worked equally well with either.

I have no interest at all in the Acetylene Illuminating Co., but feel that such an invention as they are putting on the market is deserving of every praise.—Yours truly,

COLIN DEFRIES.

### TESTING VALVE SPRINGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you, or any reader of the *M.C.J.*, would inform me how I can tell if the valve springs on my motor are of the same tension, and whether it is necessary to have them exactly alike.—Yours truly,

NOVICE.

[The usual method of testing the springs of the valves is by comparing the tension of each, this being usually done between thumb and finger. It is not so essential to have them accurate as to see that they are sufficiently strong to close the valves properly.]

### IMPRESSIONS AT THE SHOW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that you have devoted some space to show impressions, and therefore venture to send you a few I gathered as the result of an inspection of the new models displayed at the recent exhibition.

Dr. A. H. Brodribb, of Guildford, on his Adams-Hewitt Mail Phaeton.

In the first place, one of the directions in which improvement may be noted is in the provisions for mounting and positively driving the engine auxiliaries—the circulating pump, the radiator fan, the lubricator and the magneto. A few years ago it was common to find the pump mounted almost anywhere upon the chassis and driven by a belt or chain, or by friction off the fly-wheel; now it is almost universal practice to make the pump integral with the engine, designed as a part of it and positively geared to it. It has also become general practice to cast the engine base with a bracket for the mounting of the magneto, and to make provision for the necessary driving gearing. Lubricators have, in the past, usually been driven by small round belts or chains; quite a number of the new cars, however, make use of oil pumps which, if not actually a part of the motor itself and geared to it, are mounted upon the dashboard and driven by an eccentric off one of the cam shafts. In short, it looks as though the days of leather belts and chains as a means of driving engine auxiliaries were nearly over, they being superseded by gear wheels, which give increased positiveness of action, greater freedom from the necessity of adjustments, and a motive power equipment complete in itself.—Yours truly,

A YORKSHIRE VISITOR.

MR. S. R. BATSON, manager of the Lindsay Motor Car Company, 1, Albemarle Street, W., would be glad to hear from the gentleman who kindly lent him the accumulator at the Ritz Hotel, about the 12th ult., as he would like to return same.

MANGANESE STEEL SHEETING.—A correspondent asks for the names of firms supplying sheet manganese steel as a substitute for aluminium for beating into panels for motor bodies.

## CLUBS AND ASSOCIATIONS.

### AUTO CYCLE CLUB.

ON Friday of last week some of the competitors in the end to end run of last summer met at dinner at Frascati's, London. A discussion subsequently took place with regard to a similar run next year. Various opinions were expressed, the idea of a six days' tour over new ground being generally favoured.

### YORKSHIRE.

THE annual dinner of the Yorkshire Automobile Club, which is to be held at the Hotel Metropole, Leeds, on the 14th inst., promises to be a great success. Mr. A. W. M. Bosville, J.P., a vice-president of the club, will preside.

The following gentlemen have been elected to membership of the club:—Messrs. G. H. Anderson, J.P., Kilnin Lodge, Howden; E. G. Arnold, 2, North Hill Road, Headingley, Leeds; R. B. Sharp, Riversleigh, Scarcroft Road, York; and M. Matthews, Bank House, Eccleshill, Bradford.

The membership of the Yorkshire Automobile Club and its

A Morning Meet in the Park.

affiliated branches now totals 549, being made up as follows:—Yorkshire A.C., 269; Barnsley Branch, 18; Bradford Branch, 53; Cleveland Branch, 53; Halifax Branch, 40; Huddersfield Branch, 116.

### LINCOLNSHIRE MOTOR CYCLE CLUB.

THOUGH only formed a couple of months ago, the Lincolnshire Motor Cycle Club membership should be 200 by the inaugural dinner, which takes place next Wednesday. Major J. A. Cole will take the chair, and among the other speakers will be Mr. Robert Todd and Mr. F. Straight. The dinner will be at the Black Goats Hotel, Lincoln, and there will be a general meeting of members at the Spread Eagle.

### TRANSVAAL.

THE annual competition of the Transvaal A.C. took place towards the close of October, attracting twelve entries. The first day's run was one of eighty-two miles, from Johannesburg to Potchefstroom; on the second day the journey was to Schoeman's Drift and back, a distance of forty-eight miles, and the third day's trip was a return to Johannesburg. Non-stop runs on the three days were made by Messrs. Piel (16-20-h.p. Adler), Gill (9-h.p. Darracq), and Connock (14-h.p. Minerva). The club's gold medal and Mr. W. E. Pack's cup were awarded to the first named.

THE A.C.G.B.I. founder members' annual dinner will be held on the 17th inst. Mr. R. W. Wallace, K.C., will preside.

A PAPER on hill climbing formula will be read by Professor

Archibald Sharp before the members of the Auto Cycle Club on the 14th inst.

A NEW list of the 100 members, together with the rules of the Liverpool Automobile Club and Self-propelled Traffic Association, has just been issued.

### PUBLIC MOTOR SERVICES.

THE annual meeting of the Torquay Motor 'Bus Company has been held. In their report the directors congratulated the shareholders on the satisfactory results obtained. The maintenance of a regular service during the past year had been attended with considerable difficulty, owing to the almost continuous interruption of traffic by the breaking up of the roads. The revenue derived from the employment of the char-a-banc motors for tours round Dartmoor and the district had been highly satisfactory, and the special facilities offered in connection with the purchase of books and tickets had been much appreciated. The company had received for fares and motor hire the sum of £5,845 8s. 8d. The expenditure showed a balance on the revenue account of £1,702 7s. 10d., and after allowing for depreciation and the usual proportion for the formation and other expenses, and placing £800 to reserve, there remained a profit of £467 19s. 8d. The directors recommended the declaration of a dividend at the rate of 7½ per cent. per annum, free of income tax.

THE Kensington and Islington Borough Councils are jointly convening a conference of the metropolitan municipal authorities, to be held at the Westminster City Hall, on Wednesday next, to consider the subject of the annoyance resulting from motor traffic through the streets of London, with a view to joint action being taken to promote legislation for controlling such traffic.

MR. FELL has asked the President of the Board of Trade if he was aware of the fact that the bulk of the motor-omnibuses in use in London had been made in Germany, and that contracts had recently been placed in that country for the construction of about £350,000 worth of these vehicles to be used in London; and whether he could in any way assist in transferring this industry to this country in such a way as to find employment for the mechanics discharged from the Woolwich Arsenal. Mr. Lloyd-George, in reply, said he was aware that many of the chassis of motor-omnibuses in use in London were of foreign production. He understood that foreign makers had had longer experience than British manufacturers in this branch of industry. This advantage, however, as in the case of motors generally, was now diminishing, and there was reason to hope that in future a large share of the orders would fall to British manufacturers. He saw no reason why suitable mechanics discharged from Woolwich Arsenal should not have an equal chance with others of sharing in any employment thus afforded.

KINTYRE MOTOR COMPANY, LTD., whose headquarters are at Campbeltown, have just increased their capital to £10,000, with the object of carrying out an important extension and the development of their service and opening up Argyllshire to motor traffic next summer.

A DISCUSSION has taken place at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, on the subject of steam as motive power for public services vehicles. In replying to the contention of one of the speakers that steam omnibuses greatly reduced the danger of skidding, an engineer of the London Road Car Company pointed out that a system had been employed successfully on one of their omnibuses for two months which, it was claimed, would almost eliminate the possibility of skidding.

JUDGMENT has been pronounced by Lord Salvesen in the action by the Glasgow and South Western Railway Company against the provost, magistrates and councillors of the burgh of Saltcoats for declarator that pursuers do not require to obtain licences from the defenders for the motor-cars and men in charge which pursuers maintain for conveyance for hire of passengers in connection with the train service on their Glasgow and Ardrossan line. His lordship, taking the view that defenders' by-laws applied to vehicles drawn by one or more horses, granted pursuers declarator and found neither party entitled to expenses.

A REPORT on the motor-bus traffic of Brighton has been prepared by Mr. W. B. Gentle, the Chief Constable, who says that the chief cause of the noise, apart from the ordinary working of the engines, has arisen from the fact that the vehicles have wooden wheels. The company have given orders for steel wheels, which will be substituted for the wooden ones; some have already been replaced with steel wheels; and they are further reducing the noise occasioned by the working of the engines, by substituting raw cowhide cogwheels for the ordinary metal ones. With regard to speed, Mr. Gentle has drawn up a time table as follows (the times to include stoppages):—

From	To	Distance.	Allowance.	Miles. per hr.
Sussex Square ...	New Steine ...	1,770 yds.	8 min.	7½
New Steine ...	Old Steine ...	450 yds.	3 min.	5
Old Steine ...	Top North St.	650 yds.	3½ min.	6½
Top North St. ...	Clarence Sq. ...	300 yds.	2 min.	5½
Clarence Sq. ...	York Road ...	600 yds.	3 min.	7

He recommends that these times be endorsed on the licence for each vehicle, and the Omnibus Company to be informed that they will be expected to run in strict conformity with the time table.

THE Great North of Scotland Railway Company announce that their motor-omnibus service between Udney, Tarves, and Methlick will be discontinued after the 31st inst.

## CASES UNDER THE MOTOR-CAR ACT.

### SECTION 1.—RECKLESS DRIVING.

Mr. Lewis Waller appeared at Coventry on the 30th ult. to answer a summons alleging reckless driving of a motor-car at Willenhall, three miles from Coventry, on the road to London. Mr. George Elliott represented defendant. Mr. Masser (for the police) said defendant was driving a motor-car of considerable power from Coventry to London at a great speed, which various witnesses estimated at from thirty to forty miles an hour. In endeavouring to avoid another motor-car an accident happened, and defendant's car swerved and turned over on the side of the road. William James Bromley, who was driving his motor-car on the same road and in the same direction, having turned out of a side lane, said defendant's car touched the right-hand dumb iron of witness's car. It then swerved, turned over on its side, dragged along four or five yards in the hubs, and finally settled down with its position entirely reversed. The occupants, Mr. Waller, a lady, and the chauffeur, were thrown out. Witness examined the car, and found defendant had jammed the brakes on. Witness added that he attended under a summons, as being a motorist he did not care to give evidence against another motorist. In the end the Bench decided to convict, and imposed a fine of £5 and costs. Mr. Elliott applied that the licence should not be endorsed pending

that there was not the slightest doubt that defendant was guilty of what he ought to know was a very dangerous practice. He was, however, pleased to see the excellent character defendant had received from his employer, and, taking that into consideration, he would impose a fine of £3 and costs.

### SECTIONS 2 AND 3.—RECKLESS DRIVING AND LICENSING.

At Coventry, Charles Hill, Broadwater, Kenilworth Road, has been summoned for driving a motor-car in a manner dangerous to the public on October 28th, and also for driving a motor-car without a licence. The Town Clerk (Mr. G. Sutton) prosecuted, and Mr. C. Mathias defended. Mr. Sutton said the first offence alleged was committed in the Burges. A constable signalled to the driver of the car to pull up, and signalled to the driver of a horse and van to come on. The motor-car continued its career, however, with the result that the driver of the horse and van had to pull up the horse on its haunches to avoid a collision, and in so doing dropped down on to the board in front of the van. The speed of the car was only about six or eight miles an hour, but he (the Town Clerk) submitted that under the circumstances the defendant drove his car in a manner dangerous to the public. The Bench imposed a fine of £2 and costs. Mr. Mathias intimated that there would probably be an appeal to the quarter sessions, and with that in view he asked that the endorsement of the licence might be sus-

The French Reliability Trials of 1907 Models.—The Cars arriving at Lyons.

consideration as to whether an appeal should be taken, and this was granted.

Edward Hill, of Bideford, was summoned to Accrington Police Court to answer a charge of driving a motor-car at a speed dangerous to the public. P.S. Bale said that on November 10th he was in Blackburn road. Defendant was driving from towards Church at a speed of twenty-five or thirty miles an hour, and certainly dangerous to the public. He put up his hand and shouted to the defendant to stop, but defendant drew off from him, nearly running into a lorry, and going away. A fine of £1 and costs was imposed, the chairman stating it would have been more if defendant had been the owner of the car.

The Derby county magistrates imposed a fine of £3 and costs upon John Scales, an Ashbourne chauffeur, for driving too quickly at Mark-eaton on November 5th. Police-Sergeant Bown said the motor-car was carrying several ladies, and he estimated its speed at thirty miles an hour.—Mr. J. E. Ducker, who defended, placed the speed at twenty-three miles an hour, and added that the car was a large one, "and therefore appeared to be going faster than it really was."

William Parrish, chauffeur to Dr. Fraser, of Bath, has been fined £3 and costs at the Bristol Police Court, for driving a motor-car down Stokes Croft on November 10th at a speed dangerous to the public. The evidence given on behalf of the prosecution showed that the car was being driven at eighteen to twenty miles an hour. Defendant denied that he was going faster than six to seven miles an hour, and stated that he had complete control over the car. The Chairman stated

pendent. This was agreed to.—In the second case, Mr. Sutton said Mr. Hill seemed to have been under a misapprehension as to his former licence having lapsed, and he (Mr. Sutton) was willing that the case should be dismissed on payment of costs, a course which the magistrates adopted.

### THE ASCOT MOTOR MISHAP.

At Windsor, on Saturday, Lieut. George A. L. Paton, of the Northumberland Fusiliers, was charged with the manslaughter of Osborn Hart, a cyclist, near Ascot, on October 23rd. From the evidence it appeared that the deceased was riding a bicycle along Westwood Road into the main London and Aldershot road and was crossing to the left side when the motor-car driven by Mr. Paton caught him and carried both him and his machine some distance. As a result of the collision his spine was fractured, and he died in Ascot Cottage Hospital the same night. The coroner's jury returned an open verdict. An assistant surveyor of the Berkshire County Council admitted that it would be difficult for anyone coming along the London road from Bagshot to see anything in the Westwood road until within a short distance. When the case for the prosecution was completed, the magistrates, without hearing the evidence for defence, retired to consider whether there was a *prima facie* case. After a few minutes' absence they returned into court. The chairman announced they had come to the conclusion that there was

not sufficient evidence to send the defendant for trial. They were of opinion that no accident would have occurred if the cyclist had not attempted to cross the road in front of the motor-car driven by the defendant. The magistrates understood that accidents had occurred at the same spot before, and therefore they thought it very desirable that some means should be taken by the County Council to protect the public in future. Lieut. Paton would be discharged.

### ROAD REPORTS.

**DERBY.**—The Derby and District A.C. has been in communication with the County Surveyor with reference to the state of the Burton road near Derby. The surveyor has assured the club that he will do his best to remedy the defects complained of.

**EASTBOURNE.**—The only portion of the main road at Eastbourne that will be under repair during the next two or three weeks is Seaside, from Langney Bridge towards Eastbourne. About the beginning of the next year, however, portions of Willingdon Road will also be under repair from the boundary towards Eastbourne.

**CAMBRIDGE.**—No main roads in Cambridge will be under repairs during the remainder of the year—an assurance of interest to local motorists.

**GODALMING.**—All the main road repairs in Godalming are completed excepting two short lengths which may be done before Christmas.

**BRADFORD.**—There will be no main roads under repair within the City of Bradford during the next three weeks which will interfere with the passage of motor traffic.

**NEWMARKET.**—A census recently taken of traffic in the Bury Road, Newmarket, shows that an average of 2,473 persons and vehicles use the road every day. We understand that the surveyor to the Urban District Council has screened a quantity of clinker and had it prepared with tar for road making. Experiments as to its use will be carried out on the Bury and Exning roads.

### COMPANY NEWS.

**CHARRON.**—£384,000. To manufacture and deal in motor-cars, and acquire the works of the Société Charron, Girardot and Voigt, at Puteaux. First directors: Sir Constantine Phipps, Admiral Sir Charles Fane, Marquis De Mun, Count Leon de Bertier de Sauvigny, E. Voigt, and E. Giraud.

**PRESTON GARAGE AND MOTOR ENGINEERING COMPANY.**—£5,000. To take over the business of a garage keeper, &c., carried on at Charnley Street, and Fishergate, Preston, by Mr. C. Parish.

**STEPNEY SPARE MOTOR WHEEL.**—£120,000. To acquire the business carried on as Davies Brothers at Stepney Works, Llanely, and to manufacture the Stepney Spare Motor Wheel. The first directors are: Mr. W. B. Jessop (chairman), Park Avenue, Bradford; Major J. A. Cole, Roxholme Hall, Sleaford; Messrs. T. M. Davies and W. Davies, both of Stepney Works, Llanely; and Mr. R. L. Wood, of Cheltenham. 9, Great James Street, W.C.

**A. DARRACQ AND COMPANY (1905).**—The first annual general meeting of A. Darracq and Company (1905), Ltd., took place on Monday. Mr. J. S. Smith-Winby (the chairman) said that this was the fourth annual meeting at which he had presided, and the net profits submitted had been as follows:—For 1903 £100,275, for 1904 £112,213, for 1905, when the extensions of the previous year had made themselves felt, £152,663, and for the year now ended £203,238. The net profits during the last four years had thus more than doubled. In securing for the company a virtual 20 per cent. interest in the Darracq-Serpollet Company the Board had secured an asset which should prove of very great value. A large interest had also been obtained in an Italian company for the construction of Darracq cars in Italy, which should give satisfactory results. A factory was being erected at Suresnes, specially designed for the construction of light cars of the voiturette type, and motor-cabs, for which they had received a large number of orders. During 1906 ninety first places had been gained in all parts of the world by Darracq cars. The business already done for next season was greater than at the corresponding period of any previous year, and if nothing unforeseen occurred, he believed in twelve months' time the directors would again have a satisfactory report to submit. For the year under review the Board considered that a distribution of 25 per cent. was a very satisfactory return upon the ordinary capital. The report was unanimously agreed to.

**PALMER TYRE.**—The report for the twelve months ended September 30th, states the profit, including £614 brought forward, is £5,462. The directors recommend a dividend (free of income-tax) at the rate of five per cent. per annum, and that £1,500 be carried to reserve, leaving to carry forward (subject to directors' fees) £962.

**BOWDEN BRAKE.**—The report for the year ended September 30 last states that the net profits, together with £535 brought forward, amount to £8,265. The directors propose to take a sum of £2,000 from the reserve fund, the available amount for distribution being thus raised to £6,265, which the directors propose to apply to a dividend at the rate of twenty per cent. per annum, leaving to carry forward, £252.

### POLICE TRAPS.

A NEW kind of police persecution of motorists has commenced on the Ripley road. It takes the form of a night trap, and is worked by the usual three men, one of whom either whistles or fires a detonator as each car passes. The driver is then ordered to stop on the most trivial pretext. One splash of mud on the identification plate, construed by an imaginative officer into an alteration of a letter or number, is sufficient to ensure a summons to Guildford and the almost inevitable fine. As the Automobile Association exists to fight persecution, they propose to take an active interest in the condition of identification plates after dark, on that portion of the road between Wisley and Guildford. If, therefore, motorists are "held up" by the patrols they will not misunderstand the action.

### AN ODE TO THE CAR.

(WRITTEN in the visitors' book of a wayside hostelry after a delightful morning run.)

Oh, turn from the town and list to me,  
To a song of the countryside,  
Of mountain and moor, of lake and lea,  
Of the joys of a royal ride  
For many a mile in a motor-car,  
With Dame Pleasure our only guide.

The clock has struck, 'tis the hour of five,  
Yet the city is still abed,  
But my good Argyll is all alive,  
True, and trusty—a thoroughbred.  
Come, friend, away, 'ere the break of day,  
'Ere the shafts of the dawn have spread.

The town's behind, and the country calls,  
And the car goes merrily on;  
Sweet is the world as the dim road falls  
From the hill where the last lamp shone.  
As the veil of dawn is softly drawn  
When the day bids the night begone.

The keen, clean rays of the coming sun  
Bravely glint on our steed of steel.  
It's hey, away, for a bracing run  
With ozone for a morning meal.  
Hurrah, hurrah, for a bonny car,  
And the hum of the whirling wheel.

Amethyst skies with a rosy blush  
Cap the hills to our right and left,  
The motor sings as the new winds rush  
By the honeycomb cleanly cleft.  
From shafts and springs to her guarding wings,  
Gay, debonair, dapper, and deft.

Faster we fly in the joyous race,  
All free from the timers of miles,  
Each pulse athrob with the pride of pace,  
And the country girl with smiles.  
A fig for the towns when the luring downs  
May be won with the word "Argylls."

The clock has struck, 'tis the hour of eight  
And the city we left lies afar,  
The signs of a wayside hostel state—  
"Good refreshment for man and car."  
Stay, call the host, and we'll give the toast—  
May good luck be the Argyll's star."

SILAS C. PENNY.

MESSRS. T. J. AND J. SMITH'S Diaries come along to remind us of the close of the year. This series of yearly books has been before the public upwards of sixty years, and has been constantly brought up to date, so that it now stands in the very front rank of such publications. The Self-Registering Pocket Diaries have the merit of compactness, and with the aid of the pencil, which is inserted in the book near the last page written on, time in finding the place is saved. This is a convenience not to be lightly esteemed. With their £1,000 insurance coupons, Smith's self-registering note books are certainly an aid to the busy man who employs a car in his calls. The firm's diaries for the desk, the pocket and the workshop are well bound, on good paper, and contain many features commending them to all business men.

# THE Motor-Car Journal.

VOL VIII.]

LONDON, SATURDAY, DECEMBER 15, 1906.

[No. 406.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

**B**Y the Dogs' Act, which comes into operation at the beginning of next year, it devolves upon the local authorities to make various regulations, some of which will be of interest to motorists, who suffer as much from the wanderings of the canine fraternity as any class of human beings. At Manchester, for instance, it has been decided that all dogs appearing in public must wear collars bearing the name and address of their owners, and animals which neglect or whose owners ignore this regulation will be liable to be confiscated and destroyed, under the new Act, after a limit of seven days. Whether this will exonerate motorists who may, unfortunately, run over collarless animals is a matter of conjecture, but it should at least prevent the fraudulent devices that have been perpetrated on motorists in certain districts, where stray animals wandering under cars have suddenly assumed considerable financial value.

### Encouraging Invention.

AMONG the popular features of the Motor Car Exhibition to be held in the Agricultural Hall, London, in April, 1907, will be the section devoted to aeronautics. This has steadily grown in interest and importance in recent years, and the "Daily Mail" on Monday announced that the Aero Club Exhibition, to be held in connection with Cordingley's Motor Show, will, it is expected, contain a number of working models of aeroplanes. In order to incite inventors to put forth their best efforts, our contemporary has offered the sum of £250, to be divided into three prizes, for the best working models of aeroplanes, to be exhibited and practically tested at the Exhibition. In view of the revival of public interest in the navigation of the air, this announcement comes at an opportune moment, and will, we doubt not, elicit many new features of interest for the balloon and airship section of the Exhibition, which, owing to the way in which space is being so well taken up for the motor-car section, will be allocated in the Berner's Hall next year.

### A Link with the Colonies.

EVERY mail from the Colonies brings news of developments with regard to the automobile in connection with public service as well as private pleasure and convenience. Now and again the newspapers appear with accounts of runs and trips, but it is evident that the novelty with which such were regarded but a year or two ago has worn off and they are now counted as ordinary experiences—varied, of course, by the difficulties of bad roads and treacherous surfaces. Our Colonial motorists will never have the mechanical troubles that prevented the monotony of motoring in the early days in this country. That was apparent on the shores of Lochs Lomond and Fyne the other day when four Albion motor-wagonettes intended for the Straits Settlements were taken on a trial run along roads made familiar to British motorists during the Scottish Trials. Mr. Heath, the chief inspecting engineer for the Colonial Crown Agent, watched the trials on behalf of the Colony, and expressed satisfaction with the route taken as providing adequate variety for demonstration

purposes. All the elements necessary to test the stamina of the cars were to be found on these roads, which abound in hills to test their climbing powers and in corners and curves difficult of negotiation. On the steep hill in the vicinity of Whistlefield, where there is a gradient of one in seven, special trials were made, and these the cars accomplished to the satisfaction of all concerned. At times a speed of about twenty miles was maintained, and the entire journey—a distance of about 100 miles—was covered at an average speed of fifteen miles an hour.

### Events of Importance.

ALREADY the programme for 1907 is being filled up, and evidently the next twelvemonth will be as busy as its predecessor. There will be the Tourist Trophy race in the early part of the year instead of in the autumn. Then on May 3 the Herefordshire A.C. will hold a hill climb on Frome's Hill, the scene of interesting competitions in the Small Car Trials; in the following month the Scottish Reliability Trials will call many motorists to the Highlands, and in July, on the 15th of that month, the Shelsey Walsh hill climb of the Midland A.C. will prove a great attraction. Will secretaries keep us informed of important events as they are arranged, so that we may make early announcement, and so prevent, in some degree, the clashing of events that has sometimes occurred?

### Provincial Welcome.

IT is the season of the annual dinners of the various associations which have sprung into existence to promote the welfare of automobilism throughout the country. An excellent feature of those which are being held this season is being seen in the presence of leaders of public life who have not yet become identified with the motor-car movement. At Sheffield, for instance, the Lord Mayor of that town, who was the chief guest of the evening, having in view the recent manufacturing developments as well as the importance of the pleasure side of the movement, stated that the Corporation would welcome the industry by securing cheaper rates of transit and water supply, and this will doubtless be appreciated by motor-car firms in the district as well as motorists generally. Sheffield is not alone in this welcoming attitude towards the new industry, Doncaster, Ipswich, Peterborough, and the authorities of the Garden City near Hitchen having promised to do all they can to assist firms establishing themselves in their areas. This tendency to encourage the development of the industry on the part of provincial boroughs is one of the most satisfactory signs of the times with regard to the automobile outlook.

### Naming Villages.

ALL villages seem very much alike to the motorist as he passes through them, and it means oftentimes a serious delay to have to stop and enquire the name of each. Some years ago a partial attempt was made to solve the difficulty by the Cyclists' Touring Club, which induced the Postmaster-General to have the name of each village displayed over the local post-office. This was satisfactory as far as it went, but unfortunately it did not go far enough. The village post-office may be situated on a side street away from the main thoroughfare, or else it is

placed in some inconspicuous cottage or humble dwelling not readily recognisable. Hence this plan is of only small service to motorists, even when properly carried out, for if inquiries have to be made as to the whereabouts of the post-office, the name of the place might as well be asked at once. The Automobile Association now promises to come to the rescue, and intends to have names placed at either end of all villages and small towns on the main lines of travel. The signs will be of large size and special design, showing not only the name of the place but the names and distances of the four nearest towns.

#### Schools and Motorists.

THE schoolmaster and the motorist should have a common interest in securing the safety of the road. This the former can assist by warning his pupils of the dangers run when public highways are converted into playgrounds; the latter can also help to disarm public opinion by driving carefully when approaching villages and schoolhouses. We learn that in the Suffolk village of Rumburgh the vicar has, with the sanction of the postal authorities, placed a notice warning motorists of the presence of a school in the vicinity, on one of the telegraph poles. This is about 200 yards from the building, and should be advocated as a desirable practice wherever schools are on the main roads. There is much useful work yet to be done in this direction.

Captain Deasy at the wheel of a Deasy Car.

#### An Important Appeal.

AN important application was made to the Divisional Court on Tuesday by Mr. Horace Avory, K.C., in moving for a rule nisi for a writ of certiorari to issue to quash a conviction by the Eddisbury Justices, before whom Mr. W. E. Rowcliffe was summoned. He was convicted under Section 30 of the Locomotives on Highways (Amendment) Act, 1878, for allowing smoke to issue from his motor-car, the evidence of one policeman being that the motor-car emitted smoke for three-quarters of a mile. Mr. Avory pointed out that a motor-car was defined by Section 1 of the Light Locomotives Act of 1896, and stated that the enactments mentioned in the Schedule to the Act of 1896 were not to apply to locomotives, and that the Schedule contains (*inter alia*) "Part 2 of the Locomotives on Highways (Amendment) Act, 1878," and that Part 2 contains Section 3, under which section the magistrates convicted Mr. Rowcliffe on the ground that the car he was driving was a locomotive which did not so far as practicable consume its own smoke. They convicted under this Act notwithstanding the fact that they described it both as a locomotive and as a motor car. Having treated the car as a locomotive and not as a motor-car, they then ordered Mr. Rowcliffe's licence to be endorsed under the Motor-

Car Act, 1903. The police, not satisfied with what they imagined was a great victory on their part, summoned Mr. Rowcliffe shortly after for a similar offence when driving the same car, but on this occasion Mr. Staplee Firth appeared for Mr. Rowcliffe, and, after arguing the case fully, the bench declined to commit themselves, reserving their decision until after an appeal on the first case had been disposed of. Mr. Justice Darling and Mr. Justice Bucknill, sitting as the Divisional Court, on Tuesday, directed an order nisi for a writ of certiorari to issue, firstly, on the grounds that the conviction was bad, because it was under a section of an Act of Parliament which did not apply to light locomotives or motor-cars; and secondly, because the direction to endorse Mr. Rowcliffe's licence was improper and illegal. Motorists are to be congratulated on such a decision.

#### Private Motor Houses.

ABOUT London and the large towns where land is valuable and building operations extensive, the motorist of moderate means often experiences difficulty in finding suitable accommodation for his car, and agents and builders in the suburbs have not been really responsive to the demand for this addition to ordinary houses. And yet these are the people who, as Motorism becomes a pleasure available to the professional and trading classes, will have to be considered. In some of the newer suburbs that have lately been formed attention has been given to the provision of motor-houses near the dwelling-places of people likely to own cars, and such enterprise should be profitable to the landlords. For there are many men hovering on the brink of possession who would quickly obtain a vehicle if they had means of garage close at hand. The impossibility of obtaining such accommodation fairly near to the place of residence has delayed many men in taking the plunge into automobilism.

#### Dust on Roads.

ALTHOUGH this is hardly the dust season, reference may well be made to the matter in the hope that those responsible for the maintenance of our public highways will give the subject adequate attention ere the nuisance is revived in the spring. In this connection, mention may be made of the report on road construction recently made by Mr. A. Gladwell, surveyor to the Eton Rural District Council, in which he refers to what he has done in recent months in connection with (a) dust laying preparations, and (b) available material of practically little commercial value. Generally speaking, he alludes to many of the much-advertised preparations as "economically impossible in rural districts where no road watering is resorted to," and he has come to the conclusion that of all preparations the use of a good granite in conjunction with a binding flux of a "tarry" character would yield the best results. The practicability of the system advocated by Mr. Gladwell is, we understand, being considered by some of the authorities now devoting attention to the subject, and a report of their conclusions will be awaited with considerable interest.

#### The Carrying of Licences.

AMONG the questions of irritating pettiness associated with automobilism is the carrying of a licence. Many motorists have been punished, not because they have had no licence, but because they happened not to have it with them when stopped by some inquisitorial policeman. The absence of the licence is usually a matter of inadvertence, and no offence need have been committed before the constable may challenge the driver of a car. This is very absurd, but absolutely legal. Now, a sportsman need not carry his licence as well as his gun. Why, then, should this be necessary in the case of motorists, who can generally be reached through the registered number on the car? We trust this will not be overlooked when the new motor-car legislation comes up for discussion.

### Obstructing the Highway.

THE Motor Union have again been the prosecutors in a case heard at the Salford Police Court, when the driver of a cart was summoned for obstructing one of the members of the Union, Dr. F. Westmacott, of Pendlebury. The offence took place on the Bolton Road, which is a very wide road, and has two lines of tramway thereon, with central standards. The doctor was at the time on his way to the hospital, to perform an urgent operation. The defendant was driving a light spring lorry on the tram-lines, and although the doctor blew his horn when some fifty yards away, and continued to blow as he approached, the defendant took no notice. The doctor was obstructed for about 100 yards, though there was a space of over 16 ft. on the left for the defendant. Further than this, after the doctor had stopped the defendant to remonstrate with him in respect of this offence, and his name and address had been taken by a constable, he repeated

siding genius of the Shrewsbury Court is an exception, and might be asked whether he expects the declaration of such biased views to assist the public in gauging his official temper. Having regard to the few cases coming before the coroners in which cars have been the actual cause of death, this statement seems foolish, and calls for notice from the authorities.

### An Annual Volume.

ANNUAL publications are now coming forward with their customary summaries of matters relating to the earth, sea, and air—motor-cars, boats, and airships conspicuously to the front in most cases. In Hazell's Annual—which is now in its twenty-second year, and is as complete and accurate as ever—is a useful article on motor vehicles, the tendencies that were prominent during the year now closing being well stated, while the statistics are brought as closely up to date as the exigencies

The French Reliability Trials of 1907 Models and Industrial Motor Vehicles.—The Arrival of the Cars in Paris after their long journey.

the offence higher up the road, so that the offence was deliberate. After considering the evidence on both sides the Bench considered the obstruction proved and fined the defendant 10s. and costs. This makes the sixth conviction for obstructing motorists which the Motor Union has secured this year.

### A Coroner's View.

ACCORDING to Mr. R. E. CLARKE, the coroner at Shrewsbury, "God created horses for the use of mankind, and the Devil invented motor-cars for the destruction of mankind." This saying has been uttered in public hearing, and so pleased the luminary of the court that he said the newspapers could publish the assertion if they liked. As a general rule, coroners have preserved an air of impartiality in automobile affairs, and the association of prejudice with their judgments has not yet been credited to coroners. But the pre-

of printing would allow. From the commercial point of view the comparison of the returns for the first nine months of 1906 with the corresponding period of 1904 is interesting as showing the doubling of British export trade in motor-cars during the two years. Here, however, the compiler of the summary is at a loss in ascertaining the extent of the home demand for British cars, which would serve to place our industry in a very favourable light. When, however, Mr. Lloyd George's Census of Production is taken, figures may be available assisting us to a proper knowledge on that point. In connection with its references to motor-boats, "Hazell's" might have enumerated the chief organisations advancing the progress of this branch of automobilism, just as the associations dealing with the movement on land are set forth. As illustrating the up-to-date character of the information in this work of reference we may instance the mention of Mr. Leslie Bucknall's notable balloon journey on Nov. 27th, and the record of the many prizes subsequently offered to inventors of air-ships.

**Touring in France.**

Now that many British motorists are about to undertake tours in France, the arrangements in connection with Customs' formalities are of great interest. We learn that a new regulation has just come into force by which the papers issued by the A.C.G.B.I.'s Touring Department to members going abroad are available in France for twelve months from the date of issue instead of being recognised only until the 31st December in each year. This is a little formality that has been adjusted in a way likely to add to the convenience of the excellent arrangements made by the club's touring department for motorists touring on the Continent.

**Road Reports.**

FROM the reports that have lately come to hand from our correspondents in various parts of the country, it would seem that less than the usual amount of road repairing is being undertaken now than is usually the case at the present season of the year. In some cases, notably in the eastern counties, complaints have arisen that loose stones have been allowed to accumulate on the roadways without being rolled in, to the danger of all users of the highway. With the advent of the Christmas season there is an increased amount of motor travel, and matters such as these become of great importance. Nowadays the closed automobile with its various fittings for the comfort of travellers is doing something to revive the social value of Christmas in the country, and, given the fair weather anticipated by the prophets, calls by motor will become fashionable from now to the middle of January. Hence the hope that surveyors will not leave their road surfaces in a condition likely to prove hurtful to tyres and distressing to motorists who brave the uncertainties of the English climate. We hope to keep our readers in northern Britain as well as the south informed of what is being done in connection with road repairs—a branch of the subject upon which so much of the development of the movement depends.

**Motor-buses in London.**

NEARLY thirty borough authorities connected with the Metropolis were represented at an important conference held in London on Wednesday. The Kensington representatives urged that the present "unwieldy" motor-buses in service were a serious danger to the public, and were depreciating property wheresoever they travelled. This is but a part of the indictment against the modern means of getting about, and is characteristically narrow in its judgment. We doubt if the police, who regulate traffic, and who have opportunities of noting the improvement that has lately taken place in the way these vehicles are handled, would describe them as unwieldy, while it is very certain there has been a wonderful improvement in the order of their running since the summer. This should be recognised by those responsible for local government, who must realise that, after all, the present motor-bus is not in a condition of finality, and that by the time their cogitations have resulted in official action the perfect vehicle may be coming upon the road. Why cannot they exercise the patience with which they expect the ratepayers to bear the burdens thrust upon them?

**The Success of Tarred Roads.**

MR. FRANK H. MASON, the American Consul-General at Paris, in a report to Washington, states that during the past summer some American tourists, travelling by automobile through France, complained that they had been annoyed by the coal-tar on certain roads adhering to the wheels and thereby being spattered over their car and clothing. He says the impression created in some quarters by this statement has been that tarred roads have not, on the whole, proved successful, and therefore transmits a report on the subject to his Government, in which he says:—The treatment of macadamised roads

and streets with crude petroleum as a preventive of dust in summer and mud in winter was first attempted in Southern France ten or fifteen years ago, and appears to have been successful for the suppression of the dust caused by ordinary traffic. But for obvious reasons the use of petroleum soon gave way to that of coal-tar, which has the additional advantage that, unlike oil, it hardens when exposed in a thin layer to the action of the air, covering the surface of the road with a practically air and watertight skin, which not only holds down the dust in dry weather, but prevents water from penetrating the roadway in time of rain, provided the road itself is well constructed and the tar properly applied. One of the first important experiments made by the French Department of Bridges and Roads was on the national route from Oran to Mers-el-Kebir, in the Algerian Department of Oran. The success of the system was fully demonstrated, and it has since been adopted and applied to many country roads and macadamised city streets throughout France, with uniform success wherever the conditions have been normal and the work properly and thoroughly performed. Tarred roadways are not recommended for steep grades, where their smooth service might be slippery and dangerous for horses.

MESSRS. HUMBER, LTD., are opening a large depot at 60-64, Brompton Road, London, W., for the sale of Humber cars.

MESSRS. S. HOLMES AND CO., of Manchester Road, Bradford, have issued what they term a "Katalog" of cheap lathes, grinders, drills, and other tools produced at their Albion Works.

MR. J. WALES SMITH, of the Motor Car Works, Woodhouse, Leeds, has recently introduced a new flexible propeller shaft for live axle cars. It is known as the "Spivey," and is claimed to obviate shock in starting and changing gear, no matter how fierce the clutch may be, and consequently to increase the life of the gears and tyres.

A HUNGERFORD motorist sends us a report of a local Council meeting, at which Mr. Bishop said: "I think it a shame that these infernal machines should so monopolise the roads. I should like to have a day shooting at the devils." And to these people the regulation of motor-car traffic should, in the opinion of some people, be entrusted.

FROM Capt. Theo Masui comes a copy of the 1907 catalogue of Germain cars, in which are given not only particulars of next year's models but also illustrations of many of the component parts. The types dealt with include the 14-h.p. and 18-h.p. and also the new six-cylinder vehicle which has made its first appearance at the Paris Salon. Special attention is also being paid to cars intended for service in the colonies and hot climates.

MR. G. H. WAIT, of Leicester, is now making a good display of motor-car accessories, clothing, &c., at his showrooms in the London Road. At his garage he is also commencing a course of instruction in motor mechanism and driving, which should be of considerable value to novices in the Midlands. The class has just commenced, and driving instruction will be given on the road at times to suit the convenience of individual pupils in and around Leicester.

FOR renovating the appearance of both the leather and enamelled parts of motor-car bodies the Turtle Motor Company, of 72, High Street, Croydon, have brought out a new preparation of considerable merit. It is applied with a soft rag, used as a pad, and removes the dirt, restoring the polish to its original condition. Thus it will be found very effective for automobiles as well as for general use, and Eucalyne—the name given to this new preparation—should be stocked by all who have dealings with motorists.

WE have received from Messrs. R. and J. Pullman, Ltd., of Godalming, a sample of a new automatic air valve they have just introduced. The apparatus, which is the joint invention of Mr. E. E. Pullman and Mr. R. Bowman, is intended to be fitted to the induction pipe between the throttle and the cylinder. The valve is exceedingly simple, there being no springs in connection with it, and we are informed that as the result of fitting one to an 8-h.p. De Dion motor, the mileage per gallon has been increased from 25 to 36. We hope to give the valve a practical trial shortly, and refer to it again in a subsequent issue.

## THE EDUCATIVE VALUE OF THE AUTOMOBILE.

THE motor-car has been treated from almost every conceivable standpoint in the technical press, and its present and prospective influence upon social and economic conditions has been fully reviewed, but no extensive comment has been made upon the very important work which it is quietly accomplishing in popularizing a knowledge of things mechanical among the general public. The forerunner of the automobile, the cycle, commenced and carried forward to no inconsiderable extent this good work.

While hitherto mechanical knowledge was supposed to be the exclusive possession of the male half of humanity, a most important exception arose, in the acquirement by hundreds of thousands of women of a practical understanding of the mechanical operation of the bicycle, its technical terms and the ordinary care of the machine. The bicycle's technical school was thus co-educational in a very high degree, and, excepting her knowledge of the sewing machine, it marks woman's début into the mechanical world. The bicycle has thus maintained a preparatory mechanical school which fits its pupils for the broader technical training offered in the mechanical university conducted by the motor-car, at which, though the tuition is high, hundreds of thousands have matriculated, or are preparing to do so.

One of the stock criticisms of the automobile offered in wearisome reiteration by that embodiment of all wisdom, the man in the street, is worded thus:—"It takes an engineer to run one." Now, with the consent of the man in question, let this sentiment be amended by changing a "t" into a "m," so that it shall read: It makes an engineer to run one. This is near the truth; for, while one may run a car without previous engineering experience, the use of the vehicle will sooner or later advance him far toward deserving the title of engineer.

Mechanical education from automobile sources begins long before the actual possession of a car. The average victim of the "fever" approaches the problem of purchasing one with seriousness and accumulates an enormous amount of literature. Before his deliberations are ended, and he has finally "cast the die," he very likely has acquired a fair abstract knowledge of many essentials of construction. If, in addition to perusing circulars, he has read extensively the automobile journals, he may be expected to know in a rough way how the petrol engine "notes," how the carburettor "carburets," and something about the relative advantages of different ignition and cooling systems, as well as to have gained some conception of the construction and respective merits of speed changing devices, and a useful smattering of other information, which he might never have obtained had not the motor-car attracted him. Attending an automobile show and inspecting his friends' machines will be sure to give concrete form to this information, and, if he has been deliberate, earnest and painstaking in making his choice, he will have become vastly enlightened before he is the actual owner of a car.

The substantial part of the training will, of course, begin when the vehicle is actually in hand. The owner will concentrate the general information which he already possesses upon the particular constructional features which his own car possesses, scrutinizing each part of it in the light of the best knowledge which he has. After actual use of the car begins, taking care of it on the part of the owner brings him more and more closely in touch with its construction and the principles underlying its operation, but it is not, remarks Mr. A. L. Clough in an American contemporary, until some derangement occurs that the owner begins to receive the full value of his tuition. The exact and intimate knowledge obtainable by the taking apart, repairing, and reassembling of parts cannot be equalled, and the best of the matter is that such information is perfectly definite and practically directed. As the actual use of the vehicle continues, and one part after another is called to the owner's attention for inspection or repair, as it inevitably will be in time, he becomes absolutely conversant with the vehicle, and is master of every

emergency as far as it is humanly possible; in other words, he has received the elements of a good education as an engineer, which he might never have obtained had he not decided to drive an automobile. Such an owner has become, almost unconsciously, a petrol motor engineer conversant with valves, cams, pistons and their relations; with carburettors, circulating pumps, lubricators and the like. He has become an electrical engineer to the extent of knowing the construction and conditions of use of dynamos, magnetos and batteries, the laws and practice governing insulation and perfect conductivity, and he has obtained a working knowledge of simple electrical testing. In the mechanical line he will have acquired a good fund of information in regard to clutches, gears, bearings, and other elements of mechanism. He will not only have learned how things are done, but how to do things in the mechanical world, for the automobile school is one of manual training. Thousands of people have become expert with the spanner and the file in this school, and the value of an ability to do things mechanical upon a motor-car is inevitably extended into other and more serious fields.

The Royal Observatory, Greenwich, from which the time for all parts of the United Kingdom is regulated.

Photo by

[Mr. O. Cook.]

WITH reference to the novel air-pump attached to one of the valve guides in their new 30-h.p. six-cylinder model, the Beaufort Motor Company ask us to state that they hope shortly to be in a position to supply the apparatus ready for attachment to all cars having four-cycle engines.

THE Education Department of the London County Council have placed an order with Messrs. Clement Talbot, Ltd., London, for one of their London-made four-cylinder engines, 100 mm. bore and 120 mm. stroke, including pump, carburettor, magneto, and commutator for supplementary ignition. The motor is intended for use at the L.C.C. Paddington Technical Institute.

EARLY recognising the expansion of the automobile business, Messrs. Wilson Bros., of Bedford, were the pioneers of the motor-car in that town. They have lately built a new place in front of a disused chapel, which they use as a garage, and through which cars can be driven from one street to another. They always keep a stock of spare parts and accessories, and can do all classes of repairs to cars or tyres.

## THE GRAND PALAIS, PARIS.

An Exterior View of the Building, showing the Illumination at Night.

A General View of the Show from a Corner of the Gallery.

# The Paris Motor-Car Exhibition.

(Continued from page 892.)

**T**O say that the ninth annual Salon d'Automobiles eclipses all its predecessors is to give but a faint idea of the excitement that is at present prevailing at the Grand Palais, in the Champs Elysees, Paris. No sooner were the doors open on Friday of last week than the rush began, and within a few minutes the building was a mass of people representative of all nations. The show, which was officially opened by M. Fallieres, the President of the Republic, who arrived promptly at 10 a.m., can, from a spectacular point of view, only be described as magnificent. Thousands of pounds have been expended on the stands alone, the elaborate drapery and festoons of flowers by day, and the myriads of electric lamps by night, making up a scene of amazing splendour. Some idea of the blaze of light after dark may be gathered from the fact that not only is all the available current from the central stations in the neighbourhood taken, but that several temporary plants have had to be put down.

and Bennett, Coventry. The latter firm have devoted considerable attention to the design and construction of machine tools for motor-car works, and their special automatic machine for milling engine cam shafts from the solid are being adopted not only in England but also by Continental makers. The tool gives a highly-finished product, with the advantage of the cams being in exact relation to each other. A cam grinding machine by the same makers is also to be seen at the stand of their French agents, Messrs. Fenwick Freres. Of motor-buses and industrial motor-vehicles there is also a large collection, reference to which, however, we must reserve until next week.

## The Grand Palais.

Returning to the Grand Palais, French firms of course predominate, but the international character of the display may be gauged from the fact that it comprises cars not only of French, but also of British, Belgian, German, Swiss, Austrian, Italian, and even Spanish construction, the single exhibit from the last-

Fig. 7.—The Chassis of the new Brillie Six-wheel 'Bus arriving at the Salon.

The view from the extreme ends of the gallery, when the roof and the stands are illuminated, is simply indescribable, while, as regards the exterior lighting, the photo we reproduce will possibly convey some idea of the blaze of light, although the colouring scheme cannot, of course, be depicted.

## The Annexe and the Machine Tool Exhibits.

The demand for space for the display of industrial motor-vehicles, motor-boats, and machinery having outgrown the capacity of the Serres or glass-houses on the banks of the Seine which formed the Horticultural Palace in the 1900 Exhibition, a huge temporary building has this year been erected on the Esplanade des Invalides, on the opposite side of the river. Probably such a large collection of machine tools suitable for use in connection with automobile construction has not before been seen under one roof, and it is pleasing to be able to record that in this section one comes across the productions of British firms at every turn. Among them are Messrs. Alfred Herbert, Ltd., Coventry; Messrs. H. W. Ward and Co., Birmingham; Messrs. Parkinson and Son, Shipley; Messrs. J. Archdale and Co., Ltd., Birmingham; Messrs. Greenwood and Batley, Leeds; Messrs. T. Rider and Sons, Bolton; the Wolseley Tool and Motor Car Company, Ltd., Birmingham; and Messrs. Webster

named country being one which, on account of its excellent design and construction, merits close attention. Perhaps the most noticeable feature of the *Salon* is the large number of Italian-built cars on view. Not only so, but the high quality of the vehicles has been much commented upon. The Fiat, Itala, and Florentia are already well known in this country, and rivals to these are now seen in the Rapid, Bianchi, Isotta Fraschini, Züst, Marchand, Aquila, Esperia, Standard, S.P.A., F.L.A.G., and Junior automobiles, all of which contain many points of interest. Steam cars are but little *en evidence*. Serpollet has given up the small pleasure cars, and is now engaged, in conjunction with Darracq, in building big steam 'buses and touring "Pullmans." The only small steam vehicle—and this is of 25-h.p.—is that exhibited by Messrs. Weyher and Richmond. Mud-stained cars—vehicles which competed in the recent trial from Paris to Monte Carlo and back of 1907 models—are given a prominent place on many of the stands. This year some attempt has been made to group the exhibits into a number of classes. Thus the Grand Nef is entirely devoted to pleasure cars, the cycles and motor-cycles having been allotted a special section in a large hall abutting on the Gallery. The non-skid tyres and bands are also to be found

together, likewise the lamp makers, the carriage builders, motor-car agents, &c. The success of the detachable rim in the Grand Prix race has turned the attention of inventors in a new direction, there being fully a score of such devices on view; while of magneto and electrical ignition specialities, lamps, &c., there is almost a bewildering selection.

#### General Tendencies.

Many and cogent as may be the reasons against the multiplication of shows from the exhibitor's point of view, there are none from that of the spectator, and those who are visiting the Grand Palais under the impression that they have already seen the most important novelties in England will find that far more

Fig. 8.—The Daimler 45-h.p. Car.

remain than they can comfortably get through in the course of the few days they are likely to spend at the *Salon*. As regards general tendencies, that of typical uniformity of design—which seems now the inevitable remark that must be made on each succeeding show—is superficially evident, but it is more than ever accompanied by variety and improvement, or at least alteration, in detail; while one great feature of the Show is, of course, the large number of six-cylinder cars on view. Some of these have already been seen in England, as, for instance, the Darracq, Hotchkiss, Berliet, Vinot-Deguingand, Gladiator, and Fiat. Additions are, however, seen in the Brasier, Mors, Bollée, Rossel, La Buire, Bolide, Gnome, Itala, Standard (Italian), S.P.A., Marchand and Germain, to mention only those which occur to us as we write. The long-announced Mercedes "six" is expected this week, but had not put in an appearance on Monday last. Engine design continues to be of a varied character, the question of cylinders cast separately or in pairs being still an open one, as is also that of the arrangement of the valves—on one or both sides. Very few single-cylinder motors are shown, but, on the other hand, quite a number of four-cylinder cars are to be seen, all apparently fitted with the same engine, which has all the four cylinders in one casting, and, probably with the view of keeping down the cost, the old form of automatic inlet valves. Radiators are either of the ribbed-tube or honeycomb pattern, in all cases provided with a fan either directly behind or combined with the flywheel. It may be added that the circular shape of radiator, as introduced by Hotchkiss and Delaunay-Belleville, seems to be growing in popularity. A good deal of ingenuity continues to be shown in the design of carburettors, while, as regards ignition, the tendency of the times seems to be towards the high-tension magneto. Lubrication by a positively-actuated pump is now to be found as a standard fitting on all the principal makes of cars. The metal-to-metal type of clutch—and more especially the multiple disc pattern *à la* Hele Shaw—is rapidly displacing the leather-faced cone, while the "gate" change-speed gear is as universal as it was at the recent Olympia Show. The direct drive on top speed is the rule, but there are few vehicles of French construction to be seen in which the side shaft in the gear-box is entirely free when the car is on top speed. Nor do we find any instance of a direct third and an indirect fourth. Transmission is still either by cardan shaft or by side-chains, with the former taking first place as regards cars of moderate and medium horse-power. Pressed steel is, with the well-known exceptions of Panhard and Charron, universal for frames other than those of cheap voitures. To meet the requirements of

town carriages with low side entrance, however, the side members are no longer made straight, but are being dropped in the centre. A somewhat interesting innovation is seen in the frames shown by Lazerges and Tourand, in which the upper edges are turned over to the outside, instead of inside, and to a degree which practically forms a tube. The *chassis-carrosserie*—by which is meant a pressed steel frame with the sides extended upwards to form part of the car body—is also a new production which is apparently meeting with favour, particularly for light cars. A salutary movement towards more efficient springing is everywhere noticeable, quite a large number of cars having semi-springs for the rear hangers, though spring dumb-irons in front have not caught on to the same extent. Where the former are not adopted it is quite usual to find a transverse spring even in the smaller chassis. There is, however, great variation in the methods adopted in fitting the latter, some makers arranging it below the cross member of the frame, while in others it projects a considerable distance behind the chassis. A noteworthy characteristic of the 1907 models is the increase in the width and diameter of brake drums. Now that touring has become so popular and extensive, the provision of adequate brake power is a necessity which we are glad to find is being recognised, some of the cars on view having brake drums at least four inches wide. There are again a number of self-starting devices to be seen, but these do not attract anything like the attention they did last year.

Having briefly dealt with the general tendencies shown in the 1907 models of the Continental builders, we now pass to a brief review of the more important and interesting exhibits.

#### The British Car Exhibits.

In the car section Great Britain is represented by five firms—Daimler, Argyll, Enfield, Napier, and Rolls-Royce. It is to be regretted that the Exhibition authorities have not thought fit to give foreign firms equally as good positions as the French manufacturers, the spaces allotted to the British firms being not only small, but outside the line of the big and attractive displays. The Daimler Co. show a 45-h.p. side-entrance car (Fig. 8), and a 30-h.p. limousine; the Argyll Co. have on view a 14–16-h.p. four-cylinder chassis and a 16–20-h.p. limousine (Fig. 9); the Enfield Autocar Co.'s exhibit comprises examples of both the 15-h.p. and 25-h.p. models; two 40-h.p. six-cylinder San Giorgio–Napier cars are displayed by the Societa S. Giorgio, of Genoa, the Italian licensees; while the Rolls-Royce six-

Fig. 9.—The Argyll 16-20-h.p. Limousine

cylinder car is to be seen on the stand of Messrs. A. de Massol and Co. in one of the side galleries.

#### The Labor Car.

A new "marque" is seen in the Labor car, exhibited by Messrs. DE CLEVES ET CHEVALIER, of Neuilly-sur-Seine, and made to their designs by the old-established engineering firm of Messrs. Weyher and Richemond. The usual lines of cardan shaft vehicles are followed, the chassis on view being of 20–30-h.p. The four cylinders are separately cast, 110 mm. bore by 140 mm. stroke. The valves are all operated off a single cam shaft; the ignition is by high tension magneto. The carburettor

is of a special automatic type, and comprises two spraying jets, the second one coming into operation as the speed of the engine increases. The clutch is of the leather faced cone type, the cone being, however, made in two halves, bolted together to facilitate its removal when this becomes necessary. The four-speed change-speed gear is operated by a gate lever, and gives a direct drive on the top speed. The frame is narrowed in front

with direct drive on top speed to the differential shaft, and thence by side chains to the rear road wheels.

#### The Niclausse Car.

A new addition to the list of French motor-car builders is Messrs. J. and A. NICLAUSSE, of Paris, who have already earned a reputation as marine boiler constructors. The chassis of the 30-40-h.p. petrol car (Fig. 11) on view is of both excellent design

Fig. 10.—The Vinot 35-50-h.p. Six-cylinder Car.

to increase the lock of the steering wheels, and is raised at the rear to clear the differential case. Altogether the Labor car appears to be a soundly-constructed vehicle.

#### The Vinot Cars.

Messrs. VINOT AND DEGUINGAND, represented in England by Messrs. T. J. Harman and Co., exhibit a 16-24-h.p. four-cylinder vehicle and a 35-50-h.p. six-cylinder car. As we dealt with these in our report of the Olympia Show, it need only be mentioned that the "six" has the cylinders cast in pairs, that the

and solid construction. The engine comprises four separate cylinders, 120 mm. bore by 140 mm. stroke, with the valves on opposite sides. Ignition is by high-tension magneto, and a half-compression device is fitted to facilitate the starting of the engine. The carburettor is of a special design, and is entirely automatic. Its throttle is controlled by a lever on the steering wheel, and a somewhat new departure is seen in inter-connecting the brake with the throttle in such a way that when the brake is applied the speed of the engine is automatically cut down.

Fig. 11.—Chassis of the Niclausse 30-40-h.p. Car.

ignition is by high tension magneto, and that the mixture is furnished by a Krebs automatic carburettor. The engine is controlled by hand and foot levers, no automatic governor being fitted. The clutch is of the disc type, and the change-speed gear is actuated by a lever working in a vertical "gate" on the Vinot special system, the arrangement, however, having been improved. Four speeds forward and a reverse are provided,

The arrangement of the water-circulating pipes is also worthy of attention, rendering as it does the valve springs very accessible. The water passes into a horizontal pipe enclosed in the crank case; from this rise two vertical pipes having short branches at their upper ends—one to each cylinder. The clutch, which is provided with a stop or brake just forward of the gear-box, is of the multiple disc type, and the change-speed gear is controlled by a

"gate" lever. The final drive is by a cardan shaft to a well-supported live axle. The chassis is supported on five springs, a feature of which is that they are quite straight, and not slightly curved, as usual, and a neat means of adjusting the brakes without the use of tools is provided. The lubrication of the engine is by a pump. Altogether the new Niclausse car is one deserving close attention.

special form of spring-held quadrant. The final drive is by a cardan shaft to a live axle, which latter is also of an interesting design. The road wheels are carried on the sleeve or casing surrounding the live axle, the outer ends of which are extended and turned over to form, as it were, the hub caps, which are bolted to the wheels. By removing these bolts the cap and the half axle can be readily drawn out.

Fig. 12.—Plan of Chassis of Germain Six-Cylinder Car.

#### The Germain Cars.

The great attraction of the stand of the ATELIERS GERMAIN, represented in England by Captain Theo Masui, is the chassis of the new Germain 60-h.p. six-cylinder car, which is, as was to be expected, an excellent specimen of automobile engineering. The cylinders are separate, and are made, as usual with this firm, of steel with brass water-jackets; the dimensions are 120 mm. bore by 130 mm. stroke. The arrangement of the crank shaft, with the object of keeping the overall length within reasonable dimensions, is particularly noteworthy. In place of the usual wide bearing between each of the crank throws there is a disc formed solid with the shaft; the periphery of the discs is grooved out to form cups or races for the ball bearings, the corresponding outer cups being made in large diameter rings suitably carried in the crank case, and within which the discs of the crank shaft rotate. The ignition is by Eisemann high-

#### The Mors Cars.

For the 1907 season the Mors cars are being made in six different sizes, viz., 10-h.p., 15-h.p., 17-h.p., 28-h.p., 45-h.p., and 50-h.p. The first five have four-cylinder engines, while the largest model has six cylinders: with the exception of the new 10 and 15-h.p. vehicles, which have live axles, the transmission is by side chains. Interest is naturally centred on the chassis of the new six-cylinder car. The cylinders—110 mm. bore by 150 mm. stroke—are cast in pairs, with the valves arranged on opposite sides. The ignition, as in the 17-h.p., 28-h.p., and 45-h.p. cars, is by low-tension magneto, accumulators and coil being fitted as a reserve. A half-compression device to facilitate starting is provided, and a special form of automatic carburettor furnishes the mixture. No centrifugal governor is fitted, the speed of the engine being controlled by the throttle

Fig. 13.—The Germain Six-Cylinder Engine.

tension magneto, a new departure being the coupling up of the governor to it, so that the sparking is automatically advanced and retarded. The speed of the engine is regulated by means of a lever on the steering wheel acting on a variable lift to the inlet valves. The clutch is of the disc type, and the change-speed gear, which gives three forward speeds and a reverse with direct drive on top, is controlled by a lever working in a

Fig. 14.—The Mors Six-Cylinder Engine.

valve, which is automatically closed as soon as the driver de-clutches. The cooling of the cylinders is effected in the usual manner by a pump which forces water, already cooled by the framed ribbed tube radiator, through the cylinder jackets, a fan being now provided. The lubrication is effected by a small pump, analogous in construction to the water-circulating pump. The clutch is of the contracting metal band type; the Mors

system of change-speed gear, in which the power is transmitted through one or other of two bevel gears to the differential shaft, is still retained, four speeds and a reverse being provided, the control being by a lever working in a "gate." A novel idea is seen in connection with the engine bonnet. With the idea of apparently, although not effectively, reducing its length, two dashboards are provided, one being located midway between the rear pair of cylinders, and the other in the usual position, hinged brass lids between the two giving access to the back portion of the motor. The new 10-h.p. and 15-h.p. live axle vehicles have been specially designed for use as town

Fig. 14.—Plan of Chassis of Hispano-Suiza Car.

carriages; a feature of the engine is that the four cylinders are all in one casting, the bore and stroke of the 10-h.p. being 75 mm. by 90 mm., and of the 15-h.p. 85 mm. by 100 mm. The valves are all mechanically operated off a single cam shaft. The ignition is by high-tension magneto, while the lubrication is maintained by pump. Two large inspection plates are fitted to the under side of the crank case. Lubrication is by gear-driven pump working off a vertical shaft. The water pump is of new design, and is driven by a cross shaft set in front of the crank case, a coupling being provided to admit of easy detachment. A fan is placed behind the ribbed-tube radiator, which is carried on a spring-supported bushing. A supplementary water tank is placed inside the bonnet on the dashboard. The change-speed gear is adapted to give three speeds forward and a reverse, with direct drive on top speed. The single controlling lever works in a "gate" quadrant. The cardan shaft is provided with a special form of universal joint, and the torque rod is carried at the front end in a spring box. The frame, which is of pressed steel, is raised at the back to clear the differential casing; the rear suspension is by means of three-quarter elliptic springs.

#### The Hispano-Suiza Car.

We have already referred to the appearance for the first time of a Spanish-built car. This is the Hispano-Suiza, made by LA SOCIEDAD HISPANO-SUIZA, of Barcelona. Two models are made—20-h.p. and 40-h.p.—both having four-cylinder engines. The cylinders are cast in pairs with the valves on opposite sides. Ignition is by high tension magneto, with a contact maker fixed on the base chamber, it being driven by skew gearing off one of the cam shafts. The clutch is of the metal-to-metal expanding type, the pedal being so connected up to the throttle that, as the clutch is withdrawn, the speed of the engine is automatically cut down. Duplicate clutch springs are employed, and these are so fitted that they can be entirely detached by the fingers. The four-speed change-speed gear has "gate" control, and the direct drive is on the third speed and not on the top, this being one of the few cars having an indirect fourth in the Show. The transmission is by cardan shaft to a live axle, which is provided with a triangular-shaped torsion rod and two side radius rods. Another characteristic feature of the vehicle is that the chassis has practically only one cross member—that at the rear. The lower half of the engine base chamber and of the gear box are joined together so that the motor-clutch and change-speed gear form a block which ties the front part of the frame rigidly together. As will be seen, the Hispano-Suiza car (Fig. 15) is not only of interest because of its being the first Spanish production, but also because of its special design.

#### The Hotchkiss Cars.

For the 1907 season three sizes of Hotchkiss cars—20-30-h.p., 25-35-h.p., and 35-45-h.p.—are being turned out. The two former have four cylinders, and the latter six, and it is the chassis of this type which attracts most attention at the stand of the HOTCHKISS COMPANY, represented in England by the London and Parisian Motor Company, Ltd. It is undoubtedly a fine piece of work, and well repays any time spent on its inspection. As, however, the cars were on view at Olympia and were described in our report of that show, we need only mention that the cylinders, which are cast in three pairs and have the valves arranged on opposite sides, are 120 mm. bore by 120 mm. stroke. The crankshaft, as is usual in Hotchkiss cars, is mounted on ball bearings, one being provided between each throw. Ignition is by gear-driven Eisemann high-tension magneto. Special attention has been devoted to the question of engine lubrication, which is effected by an improved form of lubricator on the dashboard. The admission piping is arranged in such a way that an equal distribution of gas to the six cylinders is obtained. The clutch, which is of the leather-faced cone type, is mounted on an extension of the crankshaft. The gear-box, which is supported on cross members immediately behind the clutch, and is smaller in size than formerly, gives four speeds forward and a reverse, with direct drive on the high gear. The control is by a single lever working in a "gate" quadrant. From the rear-box the power is conveyed through a cardan shaft and bevel gear on to a live axle, the latter being so arranged that it has only the driving strain to withstand, the weight of the car being carried by the sleeve surrounding it.

#### The Sanchis Combined Pressed Steel Frame and Body.

One of the novelties of the show is the combined pressed steel frame and skeleton body (Fig. 16) exhibited by M. Enrique Sanchis, of Paris. Sheet metal panels are riveted to the framework of the seats, the whole resulting, it is claimed, in a lighter and stronger construction than when wood is employed.

#### The Isotta-Fraschini Cars.

The Isotta Fraschini cars, which made their debut in England at the Agricultural Hall Show in March last, continue to attract considerable attention. Three sizes are being made, 16-22-h.p., 28-35-h.p., and 50-65-h.p., all being fitted with side chain transmission. As the vehicles have already been fully described in the *M.C.J.*, it is unnecessary to deal with them at any length, but it may be mentioned that slight modifications

Fig. 16.—The Sanchis Combination Frame and Skeleton Body.

have been made in the motors, which have the valves operated off separate cam shafts, and that the ignition is by high tension magneto. The flywheel is adapted to act as a fan, while the clutch is of the multiple disc type. The usual brake on the differential shaft is supplemented by one on the forward end of the gear box side shaft. In the two larger sizes the top gear is now a direct drive. The novelty at the stand is the new automatic engine starting device which can be fitted to the 28-35-h.p. and 50-65-h.p. cars. The arrangement, which appears to be both simple and practical, consists of a small air-pump operated by an eccentric off the differential shaft, which compresses air in a tank fixed transversely in the frame to a

pressure of 12 atmospheres. The tank is connected by a pipe to a special device on the rear end of the cam shaft, which, when a heel pedal is pressed down, permits the compressed air to pass into the cylinder, through a special inlet arranged at the side of the explosion chamber, in which the piston is at its uppermost position.

#### The Brasier Car.

The centre of attraction at the stand of LA SOCIÉTÉ DE CONSTRUCTIONS D'AUTOMOBILES "Le Trefle à Quatre Feuilles" is the engine (Fig. 17), for the new Brasier 45-60-h.p. six-cylinder car, which supplements the three sizes of four cylinder vehicles—12-15-h.p., 16-26-h.p., 30-40-h.p.—this concern is building for the 1907 season. The small machine has a live axle,

Fig. 17.—The Brasier Six-Cylinder Engine.

but all the others have side chain transmission. A sub-frame of tubular construction is still employed to carry the engine and gear-box; the main frame is, however, now narrowed in front to increase the lock of the steering-wheels. The cylinders are cast in pairs, with the valves all arranged on one side; the dimensions of the 12-15-h.p. engine are 75 mm. bore by 120 mm., of the 16-26-h.p. 90 mm. bore by 120 mm., and of the 30-40-h.p. and 45-60-h.p. 112 mm. by 130 mm. stroke. The crank shaft is *desaxé*, that is to say, it is slightly out of line with the centre of the cylinders. Ignition is by low tension magneto, the operating shaft being located overhead with the strikers so arranged that each may be taken out independently of the others. The carburettor is of a new design, the additional air supply for the mixture being regulated automatically by means of a small conical valve. The apparatus is much smaller and lighter than the one used on the 1906 cars, and is claimed to give more power, greater flexibility, and increased economy of fuel. On the two smaller models thermo-syphon water circulation is employed; the larger cars, however, have a centrifugal pump, and a radiator similar to those used on this year's racers. The leather-faced cone type of clutch is retained, a positive locking device being employed on the "six" to prevent any chance of slipping; a double-jointed shaft connects the clutch with the gear-box. The latter is adapted to give four speeds forward and a reverse, with single operating lever working in a "gate." On the top speed the drive is direct to the differential shaft. The steering gear has been strengthened, and the steering column increased in diameter. Ball-bearings are fitted to all parts except the engine. Each car is made in two lengths of chassis, so that any type of body may be fitted.

#### The Arbel Chassis.

The ARBEL COMPANY make a big display of pressed steel frames, the *don* of their exhibition being a frame 27 ft. long,

fitted with the framework of a char-a-banc body, which is also of pressed steel. Seating accommodation for thirty-six persons is arranged, gallery fashion, in nine rows, each of which is at a slightly higher level than the others, so that all the passengers can have an unobstructed view ahead. The frame and body form undoubtedly a wonderful example of pressed steel work, and indicate the huge plant the Arbel Company have at their disposal.

#### The De Dietrich Cars.

For the 1907 season four sizes of the well-known De Dietrich cars are being built—16-h.p., 24-h.p., 40-h.p., and 60-h.p.—all having four-cylinder engines and side-chain transmission. Prominent on the stand of the DE DIETRICH COMPANY is a chassis of the latest type of 40-h.p. De Dietrich car, in which a number of changes and improvements have been made. The four cylinders, cast in two pairs, as regards the water jackets are separate, and are 130 mm. bore by 160 mm. stroke. The valves are all located on one side, and operated off a single cam shaft. The mixture is furnished by an automatic carburettor, with hot water jacket, specially designed to secure economical and silent running. The lubrication of the engine is automatically effected, a useful feature being the gauge and tap fitted in the crank case, which enables the oil level to be seen without it being necessary to open up the inspection doors. The ignition is by low tension magneto, the ignition plates being now placed at the side of the inlet valves,

Fig. 18.—Detail View of the De Dietrich Metal-to-metal Clutch.

instead of on top of the cylinders, as hitherto. To facilitate the starting of the engine a special half compression device, operated from the front of the car, is provided. An important feature of the new models is the metal-to-metal clutch (Fig. 18). It is of the internal expanding type and runs entirely in oil in the centre of the flywheel. The latter is provided with a liner of cast iron drilled all round with small hole; a small channel is also turned out of the flywheel so as to leave a space for the oil which is pressed

through the holes when the clutch engages. The latter consists of a T-piece of forged steel; to one end of this a complete segment of cast iron is carried on an eccentric pin which is used for adjustment as well as fixing the segment to the T-piece. The other end of the segment is connected to a toggle joint and lever, which in turn is also coupled with the T-piece. Midway on the lever is fitted a small

Fig. 19.—A Renault Car fitted with Victoria Suspension.

roller and at the end a spring for contracting the clutch. The expansion is effected by a steel cone which slides on the T-piece and works on the roller on the lever. When the clutch is let in, the main clutch spring, which is carried outside, pushes the cone forward and forces the lever away from the centre, at the same time expanding the segment through the toggle joint. By depressing the pedal the cone is withdrawn and the small spring at the end of the lever contracts the segment. It is claimed that the clutch always takes the drive up gently, as, before it will grip, the oil has to be forced through the liner. The clutch can also be "slipped" continuously, as the oil returns through the liner on to the surfaces as soon as any contraction takes place. A universally-jointed shaft connects the device with the gear-box, the latter being adapted to give four speeds forward and a reverse, all being controlled by a lever working in a special "gate" quadrant. A new self-starting device, known as the Letombe, is fitted to the 24-h.p. chassis, some particulars of which we hope to give in a later issue.

#### The Victoria Suspension.

A somewhat novel system of frame suspension known as the "Victoria" is shown by M. C. E. KOLB, of Paris. It is fitted to an old Renault car. As will be seen from Fig. 19, the side springs, instead of being attached to the axle in the usual way, are mounted midway upon girder plates, one at each side,

Fig. 20.—The Zedel Four-Cylinder Two-seated Car.

and jointed freely to the axle at the rear end, and at the other are supported upon spiral springs carried on studs depending from the side members of the frame. The arrangement not only gives a longer wheel-base to a short chassis, and so permits the fitting of a side-entrance body, but it gives a better suspension to vehicles having a long chassis. At the same time, vibration is reduced and a great saving in tyres effected.

#### The Werner Voiturette.

The Werner Company, which has recently been acquired by Messrs. GALLIA and SARDA, in addition to their motor-cycles, are showing for the first time a two-seated voiturette, a replica in miniature of a large touring car. The engine is of 7-h.p., and comprises two cylinders, 70 mm. bore by 100 mm. stroke. The ignition is either by magneto or accumulators as desired, while a special feature of the equipment is a new design of automatic carburettor. No pump is employed for the water circulation, which is on the thermo-syphon system. The clutch is of the standard leather-faced cone type, and the gear-box gives three speeds and a reverse with direct drive on top speed through a cardan shaft and bevel gear to a live axle.

#### The Zedel Car.

An exceedingly interesting miniature four-cylinder car is shown by LA FABRIQUE DE MOTEURS ZEDEL, of Pontarlier (Doubs). Built only as a two-seater (Fig. 20), it has a pressed steel frame, automatic carburettor, high-tension magneto ignition, lubricating oil pump, and ball bearings to all parts except the

Fig. 21.—Front View of Underberg 24-h.p. Car.

engine. The four cylinders, 67 mm. bore by 80 mm. stroke, are all in one casting, with the valves arranged on opposite sides. The transmission is by a cardan shaft to a live axle, the square ends of which drive the rear road wheels through the hubs, the wheels themselves running on the axle casing, a flywheel fan, multiple disc clutch and "gate" change-speed gear are also provided.

#### The Underberg Cars.

Messrs. UNDERBERG AND CO., of Nantes, whose voiturette we remember inspecting some years ago, are now turning out large cars, the chassis exhibited being of 24-h.p. It follows the general arrangements of chain-driven vehicles; we note, however, that the armoured wood frame as employed by Panhard is still retained and that the steering gear is arranged on somewhat novel lines. The end of the steering column is connected, not to the arm near one of the front wheels, as usual, but to an arm fulcrumed in the middle of the axle, the cross connecting rod being in two halves. Other models on view include a 16-h.p. and a 12-h.p.; the latter has a live axle and is designed for use as a town carriage.

### The Gros Six-wheel and Cail-Borderel Cars.

One of the novelties of the Show is to be seen at the stand of M. J. BORDEREL, Paris, where is exhibited a 25-30-h.p. six-wheel motor-car, built to the designs of M. F. Gros. Apart from the six wheels, a noticeable feature of interest lies in the arrangement of the suspension of the chassis by balanced springs, the object of the designer being not so much to obviate side-slip as to permit of the use of solid tyres in place of pneumatics. As

Fig. 22.—Elevation of Chassis of Bolide 35-h.p. Six-Cylinder Car.

regards the mechanical part of the car, the four-cylinder engine is connected through a gear-box to a differential shaft in the usual way, the latter transmitting the power by side chains to the central pair of wheels. The Cail-Borderel car is of 30-h.p., the feature of the motor being that the four cylinders are in one casting, with the valves all on the same side. The transmission is by a cardan shaft to a rear live axle of special design. The casing surrounding the latter is of pressed steel, while the axles are so arranged that by removing the hub caps they can be drawn out, enabling the bevel crown wheel and the differential gear to be lifted out.

### The Gobron-Brillie Cars.

Although 24-h.p. and 35-h.p. cars are being made, the exhibit of the GOBRON-BRILLIE CO. is confined to 40-60-h.p. vehicles, in which the well-known engine, with its four cylinders and eight pistons, is still retained; the valves are now all operated off a single cam shaft, and the ignition is by high-tension magneto. The clutch is of a duplex type, a central one, metal-to-metal, engaging slightly in advance of the main leather-faced cone, so that the load is taken up without shock. The change-speed gear in the 1907 model is controlled by a lever working in a "gate," the final drive being by side chains. Two brakes are now provided on the differential shaft in addition to the usual hand-operated brakes on the rear road wheels.

### The Bolide Cars.

There are a number of special features to be found in the Bolide cars shown by LA SOCIÉTÉ DES AUTOMOBILES BOLIDE,

Fig. 23.—Part Sectional Plan of Live Axle of Bolide Six-Cylinder Car.

Paris. Three models are staged—12-h.p. and 22-h.p. four-cylinder, and 35-h.p. six-cylinder, all having live axles. The engine of the 12-h.p. type has all four cylinders in one casting and the valves operated off a single cam shaft. The cylinders of the 22-h.p. and 35-h.p. cars are, on the other hand, cast in pairs, with the valves all on one side; the bore is 100 mm. and the stroke 120 mm. Referring more particularly to the last-

named model, Fig. 22, it may be mentioned that the ignition is by gear-driven Simms-Bosch high-tension magneto. The radiator is on exceedingly novel lines; in place of the usual honeycomb or ribbed tubes a circular frame forming the tank is employed, within which is a revolving radiator the tubes of which are built up in the form of a fan. Something of the kind was seen at the Agricultural Hall Show a couple of years ago, but, like its predecessor, we imagine the arrangement on the Bolide car will prove more novel than practical. The clutch is of the multiple disc type and the change-speed gear gives four speeds forward and a reverse, the control being by a gate lever. The back axle is of special design and is made under the Vigneaux patents. As will be seen from Fig. 23, the weight of the car is taken by a fixed axle A; the live shafts, which have thus only the driving strain to withstand, are, furthermore, each in two parts, they being connected by the cardan joints M, thus no shocks due to bad roads are transmitted to the bevel or differential gear, while by disconnecting the joints M and X the whole differential case can be quickly detached from the chassis, without even jacking up the rear wheels.

### The Mistral Car and the Bozier Change-speed Gear.

With the view of meeting the demand for a two-seated car at a low price, Messrs. Bozier, of Puteaux (Seine) are manufacturing and showing a little vehicle known as the Mistral, which is being introduced into England by M. H. Cintrat. The engine, which is a  $4\frac{1}{2}$ -h.p. single-cylinder De Dion, is fixed in the frame in a somewhat novel position; the crank shaft, instead of being

Fig. 24.—Sectional Plan View of New Bozier Change Speed Gear.

at right angles to the front axle, is at an angle of about forty-five degrees thereto. The result is that the cardan shaft from the gear-box drives a bevel crown wheel at one end of instead of the centre of the back axle. A further original design is found in the change-speed gear-box, a sectional plan view of which is given in Fig. 24. To fully understand the action of the gear it must first be realised that the cardan shaft which conveys the power to the rear axle is at its forward end attached to a universal joint, the outer part of which, together with the short shaft formed with it, is free to slide to and fro laterally a short distance—about  $1\frac{1}{2}$  in. on each side of the centre, in a opening in the gear-box. Large oblong-shaped plates are formed on the shaft to act as covers, both internal and external, to the recess in the gear-box, and also to act as guides for the sliding action. To the inner end of the short shaft is attached a hollow drum having internally-cut spur teeth (C) formed on the widest end. A is the clutch-shaft, the rear end of which is square in section; fixed on the latter in such a way that, while they must rotate with the shaft, they can be slid along to the right or left are three different sized pinions, D, E, F. By means of the "gate" change-speed lever, which is connected with the actuating rod J, any of the three pinions can be brought vertically below the toothed ring C, the latter being simultaneously moved to and fro to correspond with the varying diameters of the different pinions. Thus, to give the first speed, the pinion F meshes with C; on the second speed, the drive is through E and C; on the third, through D and C. On the fourth speed all the pinions are

disengaged, the power being transmitted direct to the cardan shaft through the dog clutch B H. The reverse is obtained by means of an intermediary pinion G on the end of the actuating rod J, the power then passing through F and G to the ring C. The gear illustrated gives, as we have shown, four forward speeds, and is that fitted to the Bozier 24-h.p. car. That on the 4½-h.p. Mistral voiturette is on similar lines, but is adapted to give only three forward speeds in addition to the reverse. The gear, which is contained in an oil-tight outer casing, is exceedingly simple, and we shall be interested in watching its behaviour in practice.

#### The Marchand Cars.

Among the Italian concerns showing six-cylinder vehicles is the SOCIETA MARCHAND, of Piacenza, represented in England by the Premier Motor Company, of Birmingham. The vehicle is of 50-60-h.p., the separately-cast cylinders being 125 mm. bore by 140 mm. stroke. The valves are arranged on each side and the ignition is by high-tension magneto. The mixture is supplied by a special automatic carburettor, and an endeavour has been made to secure that the gas for each cylinder shall have an equal distance to travel; while this has been obtained the arrangement of the pipes does not, however, strike us as being neat. The clutch is of the multiple disc type, and the change-speed gear is controlled by a "gate" lever. The transmission is by side chains, two brakes being provided on the differential shaft in addition to the hand-operated ones on the rear road wheels. A 28-32-h.p. four-cylinder car is also shown, this being, generally speaking, on the same lines as the "six."

Fig. 25.—The New Krieger Electrical Landulet.

#### The Krieger Electrical Vehicle.

The Krieger Company exhibits quite a new design of electrical vehicle, built, as regards its outward appearance, to closely resemble a petrol car (Fig. 25). The pressed steel frame is dropped to give a low entrance to the inside seats, while the wheel base is longer than hitherto. The motors are still supported from the front axle, and drive on to the forward road wheels. A Krieger combination petrol-electric car on the lines of that described in our report of the 1905 *Salon* is also on view.

#### The Longuemare Automatic Extra Air Inlet for Carburettors.

The old-established firm of Vve. L. Longuemare have, as usual, a large display of the largely-used Longuemare carburettors. The novelty for 1907 is an automatic extra air inlet, fitted near the throttle valve, between the carburettor and the explosion chamber. A sectional view of the apparatus is given in Fig. 26, from which it will be seen that it consists of a hollow piston *a*, free to rise and fall in a small cylinder *b*, the lower end of which is closed by the cap *c*; the piston *a* is pierced by a number of small holes *d*, *e*, the lower set of which can be closed by means of a rotating disc *k*, held in position by the screw *q*. Formed in one with the piston *a* is a cylindrical sleeve *g* working in the corresponding part *h* of the device. The outer casing and the sleeve are both pierced by specially-shaped holes *i*, *j*, these being so arranged that when the piston *a* is at its highest point the two series of holes are exactly in line with each other, allowing the maximum supply of air to

enter. Above the air valve is a perforated tube *p*, connected at one side with the pipe *m* from the carburettor, this being provided to cause an intimate mixture of the additional air with the carburetted vapour. The ordinary piston throttle is provided at *r*, by means of which the opening in the inlet pipe *n* to the engine can be more or less varied, either by a hand lever

Fig. 26.—Sectional Views of Longuemare Automatic Extra Air-Inlet Valve.

- |                    |                               |                     |

jacket is provided at *v*, in order to prevent any condensation of the petrol in the carburetted charge. The new valve is shown fitted to a single-cylinder engine in Fig. 27; it can, however, be adapted equally well to two four-cylinder motors.

(To be continued.)

## DESTRUCTIVE EFFECT OF BROKEN VALVES.

ONE of the highly-destructive accidents which may befall a petrol car is the cracking of the head of a cylinder and the fracture of its piston due to the breakage of a valve. If the head of a valve becomes broken or detached from its stem it is likely to find its way through the port into the cylinder, and when the piston comes up it may be caught in the very restricted space between the latter and the cylinder head and stresses developed in the piston and cylinder heads sufficient to cause their breakage. A broken inlet valve is rather more likely to lead to this accident than is a broken exhaust valve, for the reason that the former is subject to the suction of the incoming charge. In order to minimise the danger of an accident of this kind the ports in some engines have been cast with a thin central bridge, which acts more or less as a safeguard against the pieces of the valve entering the cylinder. Obviously, the most effective preventive of trouble of this kind is to use valves which possess the least liability of breaking in service, and the special nickel steels used for this purpose by careful manufacturers come very near the ideal in this respect. The valve and its stem are a single forging, in the best practice—the custom of riveting the head on to the stem having generally been discarded by the leading designers. Special attention is required in the form of the portion where the stem

One of the Motor-Buses running between Honfleur and Trouville.

expands to form the head, as this is the most vulnerable part of a valve. A fillet of liberal dimensions ought here to be provided.

The adoption of the mechanically-operated inlet and exhaust valves and of improved cam design has greatly reduced the danger of broken valves. Indeed, a uniform acceleration cam and spring can be so proportioned as to reduce the velocity of the valve at the moment of seating to zero, theoretically. Under such a condition the valve is not subject to a blow and should never break. In practice, however, there is always a slight impact between the valve and its seat, but one which may be reduced to a minimum. Automatic inlet valves, in closing, move at their maximum velocity at the moment of seating, and the blow produced is much greater than it need be with a mechanically controlled valve. Inlet valves of the automatic type are thus quite prone to breakage. The employment of solid piece valves with ample metal at the junction between head and stem, formed of an alloy steel of the maximum toughness consistent with its possession of proper heat-resisting qualities, and the operation of these valves from cams of gently-closing contour, should render extremely remote the possibility of broken valves, and the serious damage which such breakages sometimes entail.

THE garage and goods entrance of Argylls London, Ltd., has been removed from Newman Passage to Percy Street, Tottenham Court Road, W.

## SOME USEFUL NOTES.

LUBRICATORS arranged to feed by gravity are not to be depended upon in very cold weather, unless they are placed where they are constantly kept warm, in order that the oil shall be maintained in a fluid condition.

CARS which are constantly in operation during the winter are preferably kept in a heated stable. If stored in a cold place the bearings will be found exceedingly stiff when the machine is taken out in frosty weather, which makes them run much harder. Besides, with many forms of carburettor, difficulties are experienced in starting the motor.

SOMETIMES when testing a multiple-cylinder engine one or two cylinders will be found to be very much weaker than the others, although the ignition, valves, timing, &c., are perfect. Close examination will generally reveal a lack of oil in the particular cylinders, the difference this can cause being remarkable.

A CORRESPONDENT writes that for the past three winters he has used with great success an anti-freezing mixture consisting of 4 gallons of water,  $1\frac{1}{2}$  gallons wood alcohol, and  $\frac{1}{2}$  gallon glycerine. He adds about 1 pint of wood alcohol each week, and enough water to keep up the normal quantity of mixture.

THE needle valve in the float chamber of the carburettor may occasionally become slightly leaky through the roughening of the conical valve surfaces due to constant vibration, or on account of small foreign particles lodging therein. The leakage may not be sufficient to cause any loss of petrol or flooding of the vapourising chamber while the engine is running, but may be sufficient in amount to lead to a constant slow dripping while the engine is stopped. As it is the practice of many motorists not to shut off the petrol supply from the tank when the car is left standing, there may be an escape of fuel in this manner, amounting in time to a very considerable amount. The petrol will usually evaporate from the floor or be absorbed by the road without forming any noticeable puddle, and unless the carburettor be very closely watched the leak may continue undetected for a long time.

THE greatest supply of "spares" that forethought based upon long experience can suggest will sometimes not suffice to save a delay, but it goes without saying that the driver whose car is well provided in this respect is far better off in the majority of instances than the motorist who trusts to luck to get to the end of his journey. Above all things, a supply of nuts and bolts of the sizes employed on the car should not be overlooked. Despite the most painstaking precaution on the part of the manufacturer to pin and lock every nut on the vehicle before it leaves the factory, there will be occasions when one or the other is missed, and few things are so trying as an attempt to secure duplicates of bolts or nuts or special types and sizes at out-of-the-way places. Even if the motorist carries nothing else, a liberal provision of these small essentials will often be the means of averting a deal of annoyance as well as a waste of time.

ON cars fitted with pressure-fed carburettors some difficulty may occasionally be experienced with leaks in the pressure pipes, and it is no easy matter to locate these. The trouble is sometimes caused by dirt getting under the check valve which controls the amount of exhaust pressure in the petrol tank. Particles of carbon get under this and prevent it from seating. It is a good idea to take this valve out every few hundred miles and clean it thoroughly. At times the connections along the pressure pipe will work loose and cause a leak, or a pin hole will appear in the pipe at some point along its length. The best and easiest way to locate these leaks is to pump up two pounds of pressure or more and then go along the line with soap suds, covering the pipe at its joints and for its entire length. The leak, if any, will betray its presence by forming bubbles, and when so located may be easily repaired.

THE New Engine Company have secured an order from the Marchioness of Ripon for one of the 30-h.p. N.E.C. cars fitted with special landaulet body.

PROFESSOR BONE, of Leeds, is of the opinion that the future of automobile engineering is as much bound up with the understanding of fuel and its combustion as with the mechanism of the engine.

THE New Speedwell Motor Company, Ltd., have such faith in the reliability of their vehicles that they are now guaranteeing their Speedwell cars for five years.

THE next term in the motor-car engineering classes at the Battersea Polytechnic commences on the 27th prox. The names of intending students are now being received by the Principal.

"CALCUTTA MOTORS, LTD.," is the title of a company which will commence next month to carry parcels and passengers in and about Calcutta. The service will be commenced with ten motor-buses and a similar number of motor lorries and vans.

MANY well-known persons were present at one of the recent sales held at "The Motor House." Amongst them were representatives of the Maharaja of Baroda and the Sultan of Johore. Much amusement was caused by one Eastern potentate, who drove up in native costume accompanied by one of his wives.

THE London staff of the Wolsley Tool and Motor-car Company, Ltd., held their house dinner on Wednesday, the 5th inst., at the Cafe Monico. There was a large attendance of members of the firm and their friends, while both the Birmingham and Crayford works staffs mustered strongly to the support of their colleagues in London.

THE Companies' Diary and Agenda Book for 1907 comes from Messrs. Jordan and Sons, Ltd., and, in addition to the usual diary features of such a publication, contains a memorandum of the requirements under the Companies' Acts, and much useful information with regard to financial matters generally, including stamp duties and fees, and miscellaneous matter of a useful and interesting character.

MESSRS. ALFRED DUNHILL, LTD., have issued a new and novel list of motorities, expressly designed to facilitate the choice of Christmas gifts for motoring friends. It contains illustrations of many novel designs in trunks, luggage boxes, tool-kits, as well as dashboard cigar and cigarette cases, foot-warmers and other useful articles, to say nothing of the foot-muffs, ladies' gauntlets, and other articles for the fair sex.

MR. COURTHOPE has asked the President of the Local Government Board whether experiments had taken place with heavy motor vehicles, running at a speed exceeding eight but not exceeding twelve miles an hour, on wheels fitted with tyres of other substances than rubber; whether such substances include wood; what conclusions, if any, had been arrived at as a result of such trials in respect of skidding on a wet surface and wear and tear of roadway. The only case of the kind referred to within the knowledge of Mr. John Burns is one in which a trial was made of a heavy motor-car running on wheels fitted with wooden tyres. The result of the trial was not, according to the reply of the President of the Local Government Board, altogether satisfactory as regards skidding.

ON Friday last week, at the invitation of Messrs. Brown Bros., we paid a visit to Great Eastern Street, E.C., to inspect the extension of premises of this well-known firm. Under the guidance of the directors we were shown through a perfect labyrinth of warehouses, whose congested state demonstrated the necessity for the premises now occupied. The new building is a substantial structure of five floors, situated in the rear of the present establishment, and will be occupied by the offices of the company, so that a more prominent position may be given to the motor department in the main building. In the evening the annual dinner of the travellers and heads of departments was held at the Hotel Cecil, where, under the chairmanship of Mr. John Brown, a very pleasant evening was spent. Messrs. Brown Bros. are to be heartily congratulated upon the success they have achieved in the motor branch of their business.

MESSRS. E. WILLIAMS AND Co. have opened a motor garage at the South Parade, Matlock Bath, where cars and tyres will also be repaired.

THE Waterloo Motor Works have placed a large order with

Messrs. A. Darracq and Co. for 1907 models, and are, therefore, in a position to give early deliveries of these cars during the coming season.

MESSRS. J. W. BROOKE AND CO., LTD., Lowestoft, have arranged to keep a consignment of Brooke motors at Fremantle, Western Australia, so that immediate deliveries may be made from stock. The first consignment left last week.

THE hospital authorities throughout the country are becoming converted to the motor ambulance. An urgent case recently occurred in Dumfries, and the patient was brought from that town to Glasgow, a distance of over sixty miles, in three hours, by the Argyll ambulance. Evidently the horse-drawn ambulance has had its day.

THE National Cyclists' Union has lodged notice of objection with the Board of Trade against the Kirkby Malzeard Light Railway Order. The opposition is to two level crossings which are contemplated in the Bill, one inside the city of Ripon, and the other just outside the boundary. There is no doubt that level crossings at these points would be both inconvenient and dangerous to users of the road.

The Dennis two-ton Delivery Van just delivered to Messrs. Faire Bros., Leicester.

The vehicle is fitted with a 20-h.p. engine with two ignitions. The gear-box gives three speeds forward and a reverse, the final drive being by worm gear.

FROM the Motor House comes a list of their recent purchases of motor accessories, motor clothing, lamps, horns, tyres, &c., which they have recently obtained from various factors, and which they are now disposing of at reduced prices. The catalogue will doubtless be of value and interest to motorists generally, and copies may be obtained on postal application to the Motor House in Euston Road, N.W.

As a souvenir of the exhibition at Olympia, Messrs. Mitchell, of Mitchell Motor Garage, Wardour Street, London, W., prepared a booklet entitled "Motor Roads to London." This gives the main routes to London from the principal towns in England and Scotland, and should prove of particular interest to motorists on the road. Published at a reasonable price, it should prove a useful guide to motorists when touring.

AN inquiry by Mr. Alexander Stuart, Commissioner to the Secretary for Scotland, into an application by the Town Council of the Burgh of Ayr for the restriction of the speed of motor-cars within the precincts of the burgh, was held at Ayr recently. Mr. Geo. H. Robb, Glasgow, who was accompanied by Mr. Robert J. Smith, C.A., Glasgow, Secretary of the Scottish Automobile Club, appeared on behalf of that Club. Mr. Wilfrid C. Macrorie and Mr. C. Basil Richards gave evidence for the Club, while Mr. A. G. Rennie, official timekeeper to the A.C.G.B.I., spoke of the speeds of tramway cars on some of the roads proposed for restriction of speeds.

THE Fife Motor Company has workshop accommodation for motor-cars at Dunfermline.

THE last of the Automobile Club's examinations for the present year was held on Wednesday.

THE Deasy car will make its debut in Ireland at the Dublin Show, where it will be exhibited by Messrs. Wayte Bros.

A POLICE-CONSTABLE in a case at Leeds on Tuesday said that he timed a chauffeur who was driving a car at the rate of 1,382 6-7 miles an hour.

It would be interesting to know under what authority the police have stopped motor-cars from travelling along the north side of Portman Square, W., during the last few days.

MR. JOSLIN'S carriage factory at Upper Norwood has been removed to Church Road, where it will be known as the Ribblesdale Carriage Works. A speciality is being made of motor-car bodies.

THE Deasy Motor-Car Manufacturing Company ask us to mention that both the foot and hand controlled brakes on the 24-h.p. Deasy car are of the contracting type, both acting on the same drums connected with the rear road wheels.

MESSRS. J. AND R. OLDFIELD, of Warwick Street, Birmingham, have just placed on the market a "Dependence" safety

lamp, which has been subjected to exhaustive tests in petrol vapour and has been found perfectly reliable. It has been specially designed for garage use, and can be safely handled in a pit for lighting and inspection purposes. This lamp is substantially made, can be hung at almost any angle, and is economical in price. During the present cold weather we are using one for heating purposes in a small stable, and will give results in a future issue.

It is not only in this country that commercial motor-vehicle trials are fated to be postponed. It is the same in the United States, where the tests which were to have been held from the 7th to the 10th November, under the auspices of the Automobile Club of America, have been

put off until next spring, owing, it is announced, to insufficient entries having been received.

STANDARDISED sparking plugs and piston rings formed the subject discussed at a recent meeting of the mechanical branch of the American Association of Licensed Automobile Manufacturers. After ascertaining the sizes most used, the merits of the different threads were discussed, and a committee appointed to submit drawings of a standard for adoption. As regards piston rings the Test Committee was instructed to conduct a series of experiments to determine the best material and design for this important part of the engine.

LETT'S DIARIES, published by Messrs. Cassell and Co., Ltd., with their coupon for £1,000 accident insurance, are familiar to all business men. The edition for 1907 contains a coupon insuring against accidents by omnibus, motor-car, cabs, and trams, as well as the risks of railway travel. At the same time the diaries are practical and of sufficient variety in design and form to meet the requirements of any class of user. In addition to the office diaries printed on good paper, and with a blotting paper of a really absorbent nature Lett's diaries also include pocket-books for the year of convenient size, yet compactly filled with useful information of the usual character. Messrs. Cassell and Co.'s list of diaries can be obtained of any bookseller.

A CORRESPONDENT writes recommending Martin's Garage, High Street, Lewes, to motorists passing through that town.

THE EARL OF ELLESMERE has placed an order for a 30-h.p. "Canley" type of Daimler car. The Duke of Portland has also placed an order for a 30-h.p. chassis.

THE Reliance Engineering Co., of Manchester Street, Liverpool, has a large garage and keeps a good stock of accessories, &c.

A GARAGE and repair works has been established in Chester Square, Ashton-under-Lyne, by the Ashton Motor Company, of which Messrs. Woodhead and Sharples are the proprietors.

THE Climax Motors, Ltd., of Coventry, have appointed Messrs. Asprey and Co., of 18, Bruton Mews, Bruton Street, New Bond Street, W., as their sole agent for the London district.

FROM the London office of the High Commissioner for Canada comes a copy of the last edition of the Canadian Trade Index, copies of which can be obtained by British manufacturers at 17, Victoria Street, W.

MESSRS. MIDDLETON and TOWNSEND, of Edinburgh, are introducing a new magnetic clutch for use on motor-cars, to which we hope to make full reference as soon as the various patents have been put through.

THE Cornwall Sea Fisheries Committee have decided that motor-boats come under the same restrictions as steam trawlers, and that proceedings will be taken against craft trawling close in shore contrary to regulations.

THE new edition of the *Motor-Car Journal* Identification Card contains the official road signals for motorists as well as the letters of identification for cars in Great Britain and Ireland. Copies will be sent free on postal application to the offices, 27-33, Charing Cross Road, W.

THE new Arrol-Johnston Car Company, Ltd., has sent us a copy of the 1907 catalogue of Arrol-Johnston pleasure cars, which has just been issued. In it full particulars are given of the 12-15-h.p., 16-25-h.p., 24-30-h.p., and 38-45-h.p. models, clearly-drawn illustrations of the different types accompanying the text.

MESSRS. DEAN AND BURDEN BROS., LTD., of Salisbury, the makers of the "Scout" cars, have appointed the Auto-Car Agencies, Ltd., of 806, Salisbury House, London Wall, E.C., their sole representatives for London and district. Showrooms will shortly be opened in the West End. The works at Salisbury are being enlarged to cope with the growing demand for the Scout vehicles.

MESSRS. S. F. EDGE, LTD., have issued two new publications of great interest and merit setting forth the history of the Napier car, and detailing the claims of the six-cylinder vehicle respectively. From the artistic point of view both lists are excellent, while their contents will help the novice to realise the important part played by the Napier in the development of the British motor industry.

MESSRS. CASSELL AND CO., LTD., have published a new volume in their "Work Handbooks," which are edited by Mr. P. N. Hasluck. In this Mr. Travers deals with motor-bicycle building, an introductory chapter on ignition coils being contributed by Mr. G. Boley. The subject is handled in a very practical manner, being illustrated with over 130 diagrams, the whole forming a thoroughly practical work for those interested in motor-cycles as an industry and a sport.

THE new Bleriot headlight fitted with the automatic lamp shade is likely to attract much notice from those who object to the dazzling effect of powerful headlights. It cuts off the high rising rays of light, projecting them on the ground, where the light is made more powerful. The shade is always in service, thus saving the driver the worry of controlling the device by mechanical means. It is composed of a series of thin plates, dull black on top, absorbing the rising light, and silver-plated beneath in order to increase the power of the projection on the ground. By the adoption of this "Noglare" Bleriot headlight the sudden change to darkness incidental to mechanically-operated shades, is obviated, and inspection of the lamp at the London depot, 53-54, Long Acre, W.C., will establish its merits among practical motorists.

## CONTINENTAL NOTES.

### Belgian Trials of Industrial Motor Vehicles.

The Belgian Automobile Club, in conjunction with the Antwerp and Flanders clubs, is organising a reliability trial of industrial motor vehicles. The competition, which will be held from the 8th to the 10th April next, will be open for (1) motor-cycles capable of carrying from 50 to 100 kilog.; (2) light vans of from 100 to 700 kilog.; (3) lorries for loads of from 700 to 1,500 kilog.; (4) wagons carrying over 1,400 kilog. and public service vehicles accommodating at least twelve passengers. The first day's run will be from Brussels to Antwerp; the second day's from Antwerp to Ghent; and the third day's from Ghent to Brussels. The judges in making the awards will have regard to (1) regularity of running; (2) fuel consumption. Entries will be received until March 1st, at the A.C.B., 5, Place Royale, Brussels.

### Motor Cycles in the Austrian Military Service.

The Austrian military authorities are very much alive to the great advantages of motor vehicles in army operations. Even the motor-cycle has been brought into use, and this for a purpose for which, as will be seen from the accompanying illustrations, they are well adapted—that of quickly establishing temporary telegraphic or telephonic communication. As will be observed, the

penalisation included a Herald, a Chenard-Walcker, three Clement-Bayards, two Westinghouses, two Decauvilles, three De Dions, an Opel-Darracq and a Boyer. The Unic, Fouillaron, Lion-Peugeot, Legros, Darracq, Prunel and Martini made the tour with the loss of a few marks. The success of the Legros car is particularly worthy of note as it is the first vehicle fitted with a two-cycle engine to go through a reliability trial of this kind. Its running was exceedingly uniform—so much so that M. Rene Legros became known as *l'horloge du concours*.

### An Accident at the Salon.

The Invalides annexe building of the Paris Salon was the scene of an explosion on Sunday afternoon. A compressed air tank at the stand of Messrs. Bonvillain and Ronceray burst, and scattered masses of wood and iron through the building. One man, who sustained injuries on the head, legs, and hands, had to be conveyed to the hospital, while six others were slightly injured.

### Public Services in France.

La Société Française de Transports Departementaux par Automobiles is the title of a company which has just been formed in Paris to establish public services in different parts of France. The idea is to link up outlying towns and villages, unprovided with railway communication, with the nearest station. The

Motor Side-Cars employed in the Austrian Army for the Rapid Erection of Temporary Telegraph Lines.

machines are provided with side cars so that they can carry two soldiers; one has merely to look after the engine and steer the bicycle, while the other has charge of the telephone or telegraph wire reel; he is also provided with a long pole, by means of which, as the machine is travelling, he is able to fix the wire on trees on the roadside or even on the ordinary hedges. The men have been so well trained in their work that it is stated they can erect a ten kilometre ( $6\frac{1}{4}$  miles) line in twenty minutes.

### The French Trials of Industrial Vehicles for Military Purposes.

The trials of industrial vehicles for military purposes were concluded on Wednesday of last week. In this case the run was from Paris to Marseilles and back, and of the nineteen machines which started eleven survived the trial, viz., three Darracq-Serpollets, two De Dions, two Orions, a Peugeot, a Mors, a Turgan, and a Berliet.

### The French Trials of 1907 Models.

The reliability trial of 1907 models from Paris to Monte Carlo and back, organised by the A.C.F., came to an end on Wednesday of last week, when twenty-one out of the thirty-seven which left Paris on the 26th ult. duly arrived back in the French capital. Those which went through the entire test without any

Darracq-Serpollet Company is said to be interested in the new undertaking.

### The A.C.F. 1907 Grand Prix Race.

The rules and regulations of the race for the Grand Prix, which the A.C.F. will hold next year under new conditions, were issued on Monday. Each manufacturer may enter three cars, the fee per vehicle until February 1st next being £200.

### Miscellaneous Items.

A motor-bus service was inaugurated last week between Alost and Graminout, Belgium.—At the last meeting of the Chambre Syndicale de l'Automobile it was announced that the value of the motor-cars exported from France during the ten months ending with October last had attained a value of £4,572,120, an increase of £1,221,240 over the corresponding period of 1905.—The Seventh Austrian International Motor-Car Exhibition is to be held in Vienna from the 28th February to the 12th March next.—Arrangements are in hand for the holding of a motor exhibition in Bergen, Norway, from July 5th to 14th next year.—Double-deck buses are now being introduced into Rotterdam.—A proposal is under consideration to organise a motor-car touring competition between Paris and Madrid in May next.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the office,  
87-88, Charing Cross Road, W.C.]

### THE FLYING PROBLEM: A PREDICTION AND A WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The attainment of greater engine power has something to do with the achievement of the art of flying, particularly in the experimental stages, but it will have little, if anything, to do with the perfect flying machine of the future, which will be a one-man apparatus requiring the manual power of the occupant only for its propulsion. Service models that carry several passengers, under favourable conditions, may be used in between, but they will serve only to narrow down and eliminate the experimental and undesirable to the necessary parts that will be practical under average weather conditions—as is the bird—and which will prove very simple indeed, as it must be of real service to mankind.

We have but to review the progress of mechanical science to see how the obstructing forces of nature, still not fully understood by man, are overcome by engine power. But we must not forget that engine power overcomes much of the obstructing forces by violent means—the sheer

The Only Way across the River.

excess of power—and this mob energy may not be so readily converted to man's use in the upper and unstable realms to which he would fly as upon *terra firma*, from whence he came, upon which he must walk, and to which his natural mechanism, his anatomy, is destined to return. In the air, having once lost the foothold or purchase of the earth, the greater the engine power developed—that is, mob energy or violent power exerted—the greater will be the loss of balancing power *pro rata*. Hence the all-important and vital need, in proposed experiments, to keep down the engine power to the lowest possible minimum in order to negotiate the air safely with the methods proposed. I venture to say that the true solution depends solely upon the artificial production of wings as flexible and buoyant as those of a bird, which I believe possible to make to-day.

A feather in the air is less subject to the action of gravity and less at the mercy of the elements than any of the aerial machines made or proposed. But, unfortunately, feathers, like wings, are not now produced by nature of dimensions large enough for man, whether they were in prehistoric ages or no. Scientists tell us that in our dreams we have returned to us vague impressions of sensations experienced by our ancestors. My ego must, therefore, have once been in the form of a bird of flight. Be that as it may, I have thought upon flying machines until I have many times flown in my dreams, and the last time I distinctly remember to have seen a host of men flying singly, who were pelting the earth with ready-made plum puddings, one of

which, striking me in the eye, awakened me, since which time I have tried to banish flying and all its fleeting glory from my mind. And I most sincerely trust that the many who are induced by the tempting baits offered to attempt flying in some of the impossible machines proposed will take warning by the fate of the plum puddings, for they were all smashed up—no, down—to atoms. That is, if they wish to enjoy a few more plum puddings at the Christmas festive board. I strongly advise the foolhardy to adopt some kind of ground anchorage, similar to that with which Sir Hiram Maxim held his flying machine in bounds, upon which I had the pleasure, many years ago, of seeing him skim, if not fly, through the air.—Yours truly,

GEORGE STURGESS.

### OVERHEATING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an "Abeille" 16-h.p. motor-car, the cylinders of which soon get overheated. The radiator is of the honeycomb type, with fan behind, and will hold fifteen quarts of water. Some cars, I believe, hold three times this quantity of water. After the engine has been running a short time the water boils and runs out by the overflow pipe, and the engine gets very hot. Do you think it necessary to have a larger or an additional radiator? There does not appear to be any stoppage in the radiator, as the water runs out when the outlet tap is turned. Can you or any of your readers suggest anything to set the matter right; if so, I should feel obliged?—Yours truly,

SUBSCRIBER.

[The radiator on "Subscriber's" car should be large enough to properly keep the engine cool if rightly constructed. The trouble may be due to faulty fan not drawing sufficient air through. "Subscriber" does not state whether the overheating occurs when the car is running or when stationary with engine running, as a great many engines will quickly boil the water if run when the car is stationary, but are soon cooled when the car is in motion, or moving at a fair rate. If, however, the overheating occurs when the above matters are gone into, we would advise either an additional radiator or a more effective one than used at present.]

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My car is fitted with a 64-h.p. Aster engine, and has run satisfactorily about three years, until just recently, when the motor seems to overheat, this being particularly noticeable around the valve chamber. The water circulation is good, and the water does not get over hot; the cylinder and piston are clean and free from carbon, &c. The compression is also good, but, all the same, I am troubled with premature firing and cannot find any reason for this. The carburettor and ignition are all right; if you think it is caused by the water jacket being furred, how can I remove any fur which may be deposited, especially around the valve chamber? Is there any reason why the water should not be introduced to the jacket at the valve chamber instead, as at present, the bottom of the cylinder? There is a boss cast on similar to the boss where the sparking plug is fixed. Could not this be drilled and tapped and the water taken in here either as an auxiliary entry or as a main entry, for the water would surround the bottom of the cylinder and would circulate by thermal action, and the pump cylinder would drive the water round the valve chamber and over the cylinder head to the radiator. I think this ought to give increased cooling at the place where it is most wanted, although one hardly likes to tell makers what to do, as surely with their experience they should know best.—Yours truly,

B. Y. 158.

[The cause of the trouble is, without doubt, due to the water jacket being furred up. The best means of removing this is to take the cylinder off and remove all plugs into the jacket and fill the jacket with a strong solution of caustic soda. The boss mentioned by our correspondent is a plug leading into the jacket; this might also be removed. Let this remain for a time and then work a piece of wire or something of the sort around as far as possible from each opening, washing out after with a good pressure of water. We doubt if much advantage would be gained by admitting the water by the valve chamber, but it might be tried if the cleaning of the jacket has no effect.]

### SMOKE OR VAPOUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an always interested reader of your valuable journal, I think that the following may prove of interest. Whilst standing outside a West End restaurant a week since, having just pulled up at the door of same, a "gentleman" rushed up to me and roared out "Do you see what you are doing?" Thinking I had possibly dropped my engine in the road, I dismounted, and this was the conversation.

"You are showing smoke, who is the owner of the car? What is the number? I shall report you to the Club; I shall report you to the police; I shall write to the owner."

My reply was to the point, one word, "Good."

Now, the car was showing nothing but vapour, being a very muggy and damp day. I dare scarcely breathe, for my breath was visible, and this kind gentleman, who I learn had a title, actually did report me to the Automobile Club and write to the owner, but from the police I have not yet heard. What is coming next? The awful vapour

was not smoke, and the very thought of it scarcely allows me to breathe on a damp day, for fear I may be summoned for showing vapour. My greatest hope is that the next time this gentleman speaks to a driver in the way he did to me, that driver may be the owner of the car, and it was with sincere regret that I was not at the time, for, even at the risk of my showing visible breath, I should have had some little remark to make to his queries; but at the time my silence was complete, especially as I have been taught in my youth to respect old age and those mentally afflicted.—Yours truly,

J. D. HILL.

### THE TURNER-MIESSE STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At the Olympia Show was exhibited a four-cylinder petrol chassis that we designed and built for Messrs. Seymours, Ltd. We have already heard, from several sources, that this has given rise to a misapprehension, and we ask your indulgence to correct it. We have no intention whatever of dropping the manufacture of the Turner-Miesse steam cars. On the contrary, we have a considerable amount of business on our books, and have arranged to manufacture an increased quantity in 1907.

The Turner-Miesse steam cars are increasing in popularity, but, as we have the necessary facilities, and more capital than we can at present employ, we accepted a contract from Messrs. Seymours for a number of petrol cars. We have also designed a light steam chassis to carry twenty passengers or two tons of goods, which will be manufactured in quantities next season.—Yours truly,

J. B. DUMBELL.

I certainly preferred to pay the money and get away at once. As a matter of fact, I did not even receive my "permis de circulation" until I finished my tour and arrived back at Havre. I went early in the season, and perhaps this accounts for their leniency.—Yours truly,

A. J. MCKINNEY.

### IMPRESSIONS AT THE SHOW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "W. W." looking in vain for a good small car of British make, costing less than £200, he must surely have missed the stand exhibiting cars of British manufacture, where I placed an order for a two-cylinder vehicle, three speeds and reverse, with "gate" gear and the locking device "W. W." speaks of, for £112 10s. A friend of mine had a similar car from the same firm last year, which gave him every satisfaction, being thoroughly reliable and a good hill-climber.—Yours truly,

E. R.

### SOLID TYRE EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to the query of "Tramp" in your issue of the 8th inst., I would like to tell him that I have had two years' experience with a small 6-8-h.p. tonneau car on solid tyres. The car is geared to twenty miles per hour on top speed, and I have never found any discomfort travelling at its fastest, neither have I ever had any tyre trouble, and I would not change to pneumatics under any consideration.

In reply to his query as to the best kind of solid tyres, I have found

Motoring in Switzerland.—A Snapshot from Geneva.

### UNTRIED CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was somewhat freely rumoured at the recent Show that several of the new six-cylinder cars, both English and foreign, had never been run upon the road, and after a careful examination of many of the cars exhibited I should certainly say that the rumour was not without foundation. It seems to me, therefore, that the public would do well to be most careful when purchasing a new six-cylinder car to be quite certain that the particular car they choose has passed through its experimental stages; otherwise they will be in the unenviable position of an owner carrying out experiments at his personal expense for the benefit of the manufacturer. In the case of the six-cylinder Brooke car the manufacturers have been busily engaged in carrying out exhaustive road tests for a lengthy period, with the result that they are now in a position to place before the public a vehicle which will give every satisfaction to its owner.—Yours truly,

ERNEST J. STEEL.

### DRIVING PERMIT IN FRANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Evidently our experience differs, as mine does not coincide with that of Mr. A. A. L. Hickman. After I landed at Havre I only received one document, the "permis de circulation," and the other, the "permis de conduire," was not even mentioned in my case. The examining official simply noted h.p., the number of the machine, &c., and asked for twenty francs. This, however, is owing to some arrangement which was made between the French Government and this individual.

the Shrewsbury-Challinor patent "Cup" tyre, the best for my purpose. They do not creep, and they have a large amount of resiliency.

With a car of the type that "Tramp" mentions, I would advise him to retain his pneumatics on the front wheels and fit a good kind of solids on the rear wheels. From my experience, I think he can then run at twenty miles per hour in perfect comfort and without undue strain on the car as a whole. He will have less expense, and if the speed mentioned satisfies him, greater pleasure, for the fear of the expense and annoyance of tyre troubles will be off his mind.—Yours truly,

ROBERT CATT.

### BRITISH AND FOREIGN AUTOMOBILE INDUSTRIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I regret that my friend, Mr. Jarrott, has not fully appreciated what I said to the shareholders of the Daimler Motor Company at their last general meeting.

I remarked that the United Kingdom was the principal market in Europe for the products of the automobile industry, and that as the purchase of foreign motor-cars in this country showed undoubted signs of falling off, it was only to be expected that the output of foreign motor-car manufacturers would correspondingly diminish.

He meets this statement, which he describes as misleading, by certain figures which he obtains from the body representing the automobile industry in France, and which figures tend to show that the size of the automobile industry in that country is still increasing.

I have no criticism to offer as to what French manufacturers may be doing in countries other than this, but I certainly maintain that the

official figures of the importation of motor-cars into this country fully sustain my statement, as the following table shows:—

For the ten months ending	Increase on previous year.
£	
October, 1903... ..	856,000 = 81 per cent.
October, 1904... ..	334,000 = 21.6 per cent.
October, 1905... ..	287,000 = 15.3 per cent.
October, 1906... ..	30,000 = 1.38 per cent.

It will be observed from the above figures that the increase during the last ten months is almost negligible, and I venture to predict that the figures for the ten months ending October of next year will show an actual decrease.

If further evidence of the justice of my contention is required, it is contained in the published remarks of a celebrated French automobile dealer which resulted from a visit of his to the lately-concluded exhibition in London.—Yours truly,

E. MANVILLE.

### SIMPLIFICATION IN VALVE MECHANISM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Looking at a six-cylinder car the other day, the engine of which has the valves on one side, the formidable row of a dozen valve stems and their springs led me to wonder whether some simplification could not be made in this part of a petrol motor. The valve gear is at all times a matter of considerable complication, for, besides the two valves which each cylinder requires, there are generally two springs, two spring retaining cotters or nuts, two push rods, two push rod guides, two cam followers and two cams. Would it not be possible to reduce the number of such parts at least one half by so arranging matters that the same spring acts to seat both the inlet and the exhaust valve of each cylinder? The operation of both the exhaust and inlet valve of each cylinder from a single cam, and by means of one push rod, is also a line along which, it seems to me, simplification of valve action might be attained.

Every reduction in the number of parts required for operating the valves would not only simplify matters but would result in reduced cost of manufacture.—Yours truly,

S. CUNNINGHAM.

### FUTURE DEVELOPMENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The everyday practicability of the motor-car being fully established, the next step in the line of advance is obviously the production of reliable vehicles of moderate speed and at prices within the means of the average user of a horse-drawn carriage. The first step toward any material cheapening of production must be the acceptance of some one or two final standards of design, thus eliminating the necessity for costly experiments. With such finality of design attained in the automobile as has long existed in the horse-drawn carriage, and with a standardization of parts, makers would be free to concentrate their attention upon the production of more efficient but less costly cars. The vital elements of the automobile are already firmly established—the form and construction of the chassis, the wheels, tyres, springs and brakes, the motor and its place at the front, the change-speed gear, the two transmission systems by chains or cardan shaft, and the forms of bodies for various uses.

There are, it is true, almost unlimited possibilities of improvement in such directions as the combination petrol-electric vehicle; change-speed gears and other devices as yet in the experimental stage, any one of which may necessitate radical and costly changes in models and methods and an entire readjustment of all conditions of making and marketing. In spite of this, however, the present indications are that for some time to come makers will be free to deal with the two subjects of perfection of detail and economy of construction, while the changes from one year to the next will be far less marked than in the past, with proportionately greater inducement to the intending buyer to purchase and use a thoroughly reliable car rather than to wait indefinitely for something better.—Yours truly,

R. HENDERSON.

THE practical demonstrations of the simplicity of the Helena tyre outfit drew many observers to the stand of Messrs. J. Lacoste and Co., at Olympia. This was described in our columns when introduced, and is a useful device for facilitating the attachment and removal of tyres, inner tubes, valves, &c. The "Lacoste" high-tension magneto; magnetos of both the high and low tension types for six-cylinder engines; the "Lacoste" contact breakers of the internal wipe pattern and patent insulated terminals for accumulators, coils, plugs, &c., were also on the stand.

MARCONI'S WIRELESS TELEGRAPH CO., LTD., had a display of ignition coils, accumulators, ammeters, &c., at Olympia. Among the exhibits was a steering pillar lamp, designed to affix to the steering pillar of the car and enable the driver to direct a beam of light on to any part of the dashboard, thus enabling him to keep proper observation over his lubricators, &c., when driving at night. If a bulb of sufficient candle-power be employed the lamp can also be used as a small search-light for reading sign-posts, &c.—an important use, having regard to the condition of many of the signposts in country districts.

## CLUBS AND ASSOCIATIONS.

### SHEFFIELD A.C.

THE first annual dinner of the Sheffield and District A.C. was held on Friday of last week in the King's Head Hotel, Sheffield. After the loyal toasts had been honoured, Mr. J. H. Pickford proposed "The City and Trade of Sheffield," and in so doing suggested that the citizens should provide the Lord Mayor and the city surveyor with automobiles.

The Lord Mayor (Ald. R. Styring), responding to the toast, said he looked upon automobilists as being among the enlightened section of the citizens; certainly they were in the forefront of the movements of the times, and they were entitled as well as any other class of the people to any recognition that he, as the Lord Mayor, could give them. But in coming amongst a company of their description he was afraid he lacked one essential condition, namely, he was not an automobilist. Still, he supposed the time had not gone by when he might be one.

Success to "The Motor Union of Great Britain and Ireland" was drunk on the call of Mr. F. B. Cawood (secretary of the Sheffield Automobile Club). He mentioned that he had never come across a place where the police authorities were spoken of by motorists better than they were in Sheffield.

Mr. W. Rees Jeffreys (secretary of the Motor Union) replied. The Motor Union, he said, was the largest organisation of its kind in the world. But they of the Union were in that position because they had received the loyal support of clubs of which the Sheffield Automobile Club was one of the most representative bodies. They existed in order to carry out the collective views of the local clubs; they existed in order to effect the legislative work of the automobile movement, and they carried out all local matters through the local clubs. He alluded to the reckless driver, saying that the desire of the police was to get this class of motorist off the streets. The interest of motorists generally was also to clear the reckless driver from the streets "even more so than the police," he added, "because it is the man who is bringing discredit upon our movement; and I am quite sure we should never aid the defence of a man whom we were advised by a local club was not a considerate driver." But the inconsiderate driver was not going to be removed by the setting of police traps. The chief victims of such traps were not the reckless drivers but the considerate motorists.

Mr. W. Robinson gave "The Public Authorities." Councillor J. E. Wing and Mr. C. F. Wike (the city surveyor) responded. Mr. Wing complained of the action of some police authorities in summoning a motorist not because he had not a licence, but merely because he had not that licence upon him when the police stopped him.

The toast of "The Sheffield and District Automobile Club" was honoured on the call of Mr. W. R. Jeffreys, the chairman responding.

An interesting event of the evening was the presentation of the Harvey Foster Challenge Cup for hill-climbing to Mr. Albert Farnell, and Mr. William Robinson's gold medal to Mr. T. Nash, who was second in the private members' competition.

### SHEFFIELD AND HALLAMSHIRE MOTOR CYCLE CLUB.

THE second annual dinner and prize distribution in connection with this club was held at the Palace Restaurant, Sheffield, and presided over by Mr. J. H. Hall. It was an enjoyable and successful gathering, ladies and gentlemen members and friends being present to the number of 120.

After the toast of "The King" had been loyally honoured, the President, in making the presentation of prizes, took the opportunity of speaking on motor matters in general. He said that although the old Motor Act was being continued for another year he saw no cause for despondency, believing the delay would be in favour of the motorist, as public opinion was being rapidly enlightened, and they would get a much better Motor Act in 1907 than they ever expected in 1906. Lighting of all vehicles on the road should be insisted upon. The increase in the membership of their club was very gratifying, and showed the club was filling a real want in the district. Certainly the club should be successful, as every member on the committee, and many others, were real hard workers, and deserved their best thanks, especially the hon. secretary, Mr. J. Haslam. Later they might approach the Motor Union as to affiliation, but if they did they should have special competitions for the clubs of the north, as the journey south was too far to make it practicable to make much of a show. After the presentation of prizes, various toasts were honoured and a musical programme carried through.

### SOUTH AFRICA.

TWENTY-ONE cars took part in the fourth annual reliability and consumption trial of the A.C. of South Africa last month. The route was from Cape Town to Houw Hoek, a distance of fifty-five miles, and back again. Non-stop runs were made by Mr. Ohlsson's 40-h.p. De

Dietrich, Dr. Fuller's 14-h. Gladiator, Mr. Smuts's 10-h.p. Panhard, Mr. White's 10-h.p. Renault, Mr. Lawton's 8-h.p. Cadillac, and Mr. C. Mills's 10-h.p. Wolseley, although it is understood that the latter was disqualified for completing the outward distance under the minimum time. In addition to the above, Mr. Simpson's 6-h.p. De Dion, Dr. Hewat's 9-h.p. Star, Mr. Mills's 6-h.p. Wolseley, and Mr. Gibson's 10-h.p. Gladiator made non-stop runs on the outward journey. The Pratt's spirit with which the tanks were replenished at Houw Hoek was given by the Colonial Oil Company.

### AERO CLUB.

IN view of the increased interest now being taken in aerial navigation by all sections of the community, the Aero Club proposes to extend the sphere of its operations by the formation of a branch for which mechanics and others will be eligible.

### AERONAUTICAL SOCIETY.

THE opening meeting of the 42nd session of the Aeronautical Society of Great Britain was held at the Society of Arts, John Street, Adelphi,

## CASES UNDER THE MOTOR-CAR ACT.

### REGISTRATION.

John Butler, a chauffeur, has been summoned at Chiswick for driving an unregistered car, and not having lights either in front or at the back. The evidence was that the car was driven by defendant along the High Road, Chiswick, at about midnight, the lights in front and at the rear of the car being extinguished. He passed police-officers, but pulled up a short distance away, and when the constables caught up with him he was lighting the lamps. It was found that the car was not registered, and that it was formerly owned by a lady at Kingston, but at the time of the offences being committed the car belonged to the Hon. E. S. Wyndham, who had not registered it. Defendant said he did not see the officers, but a jolt caused the lights to be extinguished, and he was lighting the lamps as they came up. Respecting the registration, he said he thought the owner had to attend to it. Mr. King: The onus is upon you not to drive an unregistered car. Fines amounting to £5 were imposed.

### RECKLESS DRIVING.

John William Bareham was summoned at the West London Police Court to answer a charge of driving a motor-car in Holland Park Avenue on the night of November 1st at a speed dangerous to the public.

A novel Road Sign on the way between Vienna and Trieste, notifying travellers to keep to the right instead of the left after crossing the boundary between the Province of Carniola and the Coast District.

(Allgemeine Automobil Zeitung.)

London, on Friday of last week, Major B. Baden-Powell (president) occupying the chair. Four papers were read, the first being one by Dr. W. N. Shaw, F.R.S., Director of the Meteorological Office, on "The Use of the Kite in Meteorological Research." In the discussion which followed the chairman said that the kite was of special value. The wind had been found to increase up to a height of 500 metres and then higher it did not very much increase. Colonel J. E. Capper, R.E., then read a paper on "The Gordon Bennett International Balloon Race." Following this paper was one by Mr. E. Stuart Bruce on "The Aeroplane Experiments of M. Santos-Dumont," after which the chairman exhibited a model he had made of that aeronaut's flying machine. The proceedings closed with a paper on "The Stability of the Conic Shape of Kites and Flying Machines," by Mr. R. M. Balston.

### LIMERICK.

THE Earl of Dunraven has been elected president of the Limerick A.C., with Sir C. Barrington Bart., Sir T. Cleave and Sir A. Shaw vice-presidents. Mr. A. Blond-Smyth is the hon. secretary. Garage arrangements for members have been made by Mr. P. E. Bourke in Upper William Street, who is providing lock-up houses for the exclusive use of members of the club.

A police officer said defendant passed him at a speed which he estimated at about thirty miles an hour. He drove on the wrong side of the road for 300 yards. Another constable gave corroborative evidence. Defendant stated that having stopped his car some 240 yards from the place where the police were stationed it would have been impossible for him to have attained the speed at which he was alleged to have passed them. Mr. Lane eventually dismissed the summons.

At Buckingham, on Tuesday, Edgar Iff was charged with driving a motor-car to the danger of the public, in Buckingham, on November 23rd. Evidence was given by Mr. James Smith (borough surveyor) and others to the effect that defendant drove round the corner of Lloyds Bank on the Market Square into West Street. He was on the off-side of the road, and gave no warning either by bell or horn of the approach of the car. Dr. Cheesman had turned the corner of Castle Street, at the cross-roads, and was crossing West Street, when Mr. C. A. Bennett, who was talking to Mr. Smith on the opposite side of the road, signalled to him and held up his hunting-whip. Dr. Cheesman stepped back and just escaped a serious accident, and he said he desired to publicly thank Mr. Bennett and Mr. Smith for saving his life. For the defence it was said that the horn was sounded and the car was directed to the off-side of the road to avoid Dr. Cheesman. A fine of £3 and 10s. 6d. costs was inflicted.

At the Marlborough Street Police Court, Mr. F. R. S. Bircham has

been summoned for driving a motor-car on the wrong side of two refuges in Piccadilly—a proceeding designated by the police as constituting danger to the public. He was fined 20s. and costs.

#### NOT STOPPING WHEN REQUESTED.

At the Rye Borough Bench, Frank Gurdon, 18, Magdalen Road, St. Leonards, was summoned for failing to stop a motor-car, driven by him, when requested by a certain person having charge of a horse by putting up his hand for that purpose. Walter Dunk, of Rye, said defendant took no notice of his signal and the colt he was driving swerved into the ditch and turned completely over. Defendant blew his horn, and that, with the noise of the machinery, frightened the animal. In cross-examination, witness said the car was going at about thirty or thirty-five miles an hour. For the defence, it was urged that the accident was the result of negligence on the part of the driver of the colt. Mr. Phillips said he did not know the law was entitled to apply to horses that were being broken in. Mr. Gurdon, on oath, absolutely denied that Dunk gave any signal to him. He would certainly have seen it if he had done so, as he was only going at the rate of ten or fifteen miles an hour. The Chairman said the majority of the Bench considered the defendant guilty and a signal was given. Defendant would be fined 10s. and 16s. costs. The case was adjourned for a week on the question of the endorsement of the licence so that the legal points might be argued.

#### THE 1907 PROGRAMME.

WITH the view of assisting club secretaries and others in arranging their fixtures we give a list of some important events of more than local interest already fixed for next year. Club officials should try and avoid making any other arrangements on these days that are likely to interfere with the success of the following:—

MAY (provisional).—Tourist Trophy race.

MAY 3RD.—Climb at Frome's Hill, organised by the Herefordshire A.C.

JUNE.—Scottish Reliability trial.

JULY.—Annual Six Days' Trial of the Auto-Cycle Club.

JULY 6TH.—The Hertfordshire A.C.'s hill-climb at Aston Hill.

JULY 15TH.—The Midland A.C.'s climb at Shelsley Walsh.

#### A NEW TYRE.

COOK's patent "Universal" tyre, a hint of the coming of which has already appeared in our pages, was shown at the Stanley Show by the inventor, Mr. O. Cook. In this, a series of transverse sections of a tyre are placed between an inner and outer rim in a way that is claimed not to detract from the resiliency of the tyre while entirely obviating the risks that are attendant on pneumatics. As a combination of the pneumatic and solid tyre the idea is ingenious and we shall watch its behaviour on the road with considerable interest.

#### PUBLIC MOTOR SERVICES.

THE Romford Urban Council have decided that at present they cannot establish a service of motor-buses.

A NOVEL application as to the employment of emergency motor-car drivers during a strike has been made to Mr. Curtis-Bennett at the Westminster Police Court by Sub-divisional Inspector Glass, who asked for summonses against a man licensed under the Motor Car Act but not under the Public Carriage Act, and against Mr. Kingham, secretary of the London General Omnibus Company respectively, for driving and permitting to drive a motor-omnibus at Brompton road during the strike of the regular drivers. It was admitted that the attention of the police to the case was called by the representatives of the Drivers' Union, and that the point at issue was whether such employment could be regarded as a case of "unavoidable necessity" under the Public Carriage Act, which permits the engagement of unlicensed substitutes in cases of emergency for a period not exceeding twenty-four hours. Mr. Curtis-Bennett granted the summonses.

A NEW motor-car service between Newcastle Emlyn and Cardigan has been inaugurated by Mr. Tom Lloyd, proprietor of the Cawdor Hotel, Newcastle Emlyn (Wales).

THE motor-bus time-table suggested for Brighton by the Chief Constable, and published in our last issue, has been confirmed by the Town Council, most of the members of which have expressed the view that the proposed regulations will be of considerable value.

#### AUTOMOBILE ACCIDENT

DR. WALDO, the City Coroner, at an inquest relating to the death of Mr. G. H. Durrant, Gray's Inn Road, London, W.C., who was knocked down by a skidding motor-omnibus, commented on the large number of accidents of this description that had happened within the last few months. The jury, in returning a verdict of accidental death, expressed the view that some efficient guard should be fitted round the wheels of motor-omnibuses.

#### ROAD REPORTS.

SUSSEX.—The work of road repair is now in hand in the Steyning East Rural District. Dyke Road, outside the Brighton borough boundary, has been receiving attention, and the steam roller has been on the Saddlecome road, on Patcham Mill road, and is now on the Dyke road near the Dyke railway station.

LANCASHIRE.—It is not at all likely that any repairs will be carried out on the main roads in the boroughs of Bury and Nelson during the next month. Mr. A. W. Bradley, the Borough Surveyor of Bury, is sinking a shaft at Elton road, near Bury Bridge, which will be open till the end of January at least. This is on the way from Tottington, and not far from the point where the road is joined by that leading to Bolton. The chief main roads likely to be under repair in Colne during the next two or three weeks are Keighley road and Burnley road, the former being east and the latter west of the town.

CAMBRIDGESHIRE.—Some discussion is taking place with regard to the state of the roads in certain districts in the county. Patches of loose stones in the Chesterton and Huntingdon roads have been complained of by residents of Cambridge, while Mr. J. Fowler, the overseer for Gamlingay, reports that the county roads in the parish are in a very bad way. For many months past tons and tons of granite have been accumulating at the sides of the roads, presumably to provide ammunition for the children, as many barrow-loads have been picked up in neighbouring fields.

COLCHESTER.—None of the roads in the borough of Colchester will be under repair during the next few days. When repairs are being executed the local authorities invariably get the stone rolled in with a steam roller at the time it is put on the road.

BECCLES.—Norfolk motorists will be interested in the knowledge that no further repairs are to be made this year on those roads in Beccles under the care of the borough surveyor.

PETERBOROUGH.—It is not likely that any of the main roads in this district will be under repair during the next week or two.

CHELTHENHAM.—In about a week the Lansdown Road will be coated with macadam for a length of about a quarter of a mile from Gloucester Road to Queen's Road, and the work will probably take about three or four weeks to complete. This is the main road from Gloucester to Cheltenham, over which there is considerable motor traffic. There is, however, an alternative route by continuing along Gloucester Road and turning along Queen's Road at the Midland Railway station, thence direct into Cheltenham.

#### COMPANY NEWS.

COLNE MOTOR COMPANY.—£1,000. First directors: Messrs. J. Mitton, D. E. Alderson, W. Alderson, W. T. Banks, W. Storr, and T. Lancaster. Red Lion Yard, Colne.

"THOMAS" RESILIENT TYRE COMPANY.—£5,000. To acquire the interest of Mr. D. C. Thomas, Llanishen, in Patent No. 25,777 of 1904 for improvements in the manufacture of rubber tyres.

THE suggestion has been made in Muskogee, U.S.A., that Mr. Andrew Carnegie should now build highways in America instead of libraries, and maps and plans of proposals in this direction are being submitted to him.

#### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment, for same is directly specified in forwarding, and the terms arranged before publication.

# THE Motor-Car Journal.

LONDON, SATURDAY, DECEMBER 22, 1906.

[No. 407.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## THE CHRISTMAS HOLIDAYS.

Owing to the Christmas Holidays our Contributors and Correspondents are requested to forward their reports, letters, and other communications for our next issue, to reach the Office not later than the first post on the morning of Monday, the 24th inst.

Similar promptitude with regard to Advertisements will facilitate the labours of the Advertising Department, and save the disappointment of the non-insertion of announcements.

## COMMENTS.

WE are within measurable distance of Christmas, and would take the opportunity to extend the Compliments of the Season to all our readers at home and abroad. Although the social customs of the times are changing in many ways, we are glad to join in preserving this good old English custom—the Scotchman has his turn with the New Year—and wishing the best of joys and pleasures to motorists wherever they are gathered together. Apart from this individual salutation we would have satisfaction in the outlook as it finds the collective body which make up the world of Motoring. Prejudice has been dispelled in many whilom vicious quarters; there has been an unmistakeable decrease in the number of cases before the courts of late, and, although the weather may have had its effect in driving the police from their customary trapping grounds to warmer quarters, we fancy the growth of public opinion against such un-British methods is having its effect in making the police less vindictive against the motorist. The industrial section of automobilism is doing well; employment is good in the districts where motor works are located, and dividends have been unprecedented. Therefore both the pleasure and the trading side of the movement may be regarded as in a happy mood, well able to join the universal felicitations with which Christmas is welcomed, and to mingle in the throng of those wishing each other a Merry Christmas and a Prosperous New Year.

### The Upkeep of the Roads.

THE motor-bus problem in London is becoming a problem in which the interests are conflicting indeed. Sentimental objections are being silenced, but opponents of a more doughty character than Sir Theodore Martin are now entering the lists. At length the London County Council has recognised the seriousness of the rival to its trams, and the amalgamation of the motor-bus companies will soon give us the spectacle of two great interests fighting for the supremacy. This will be good news for the frugal traveller—if he is not run down in the meantime. There is one important suggestion in the report which the Highways Committee of the L.C.C. presented on Tuesday that should not be overlooked by those responsible for motor-bus services. It has been darkly hinted by borough councils in the past, but now that it has been mentioned at Spring Gardens the idea will

probably be brought into greater prominence by those interested in municipal administration. We refer to the view that as the Council has to provide and maintain a proper track for its trams, the motor-bus companies should contribute to the cost of the route over which they run. True, both trams and buses use the public highways as a means of profit, but to suggest that therefore the motor-buses should be mulcted in expense is quite an innovation. If this principle is admitted it should be applied to all carriers, cabmen and others who carry goods or persons for profit. To single out buses, and then to restrict the charge to those of the mechanical order, seems unfair and unreasonable. Doubtless they are recognised as the coming competitors to the Council's trams; hence the desire to handicap them in the race.

### Airships at the Show.

THE offer by Lord Northcliffe of £250 to be given as prizes for working models of aeroplanes, to be exhibited at the Agricultural Hall Motor-car Show, next spring, will serve to incite inventors even more than the prize previously offered by the newspaper with which he is associated. The leading organisations in the Press are already discussing the excellent conditions which will be afforded for the display of improvements in aeronautics, and, coupled with the revival of public interest in the subject, there is no doubt that the Aero Club display at the next Motor Car Exhibition will be of considerable importance. As we mentioned last week, the space devoted to this section of the Exhibition will be much greater than heretofore, and this has been secured without any lessening of that taken up by motor-cars and their accessories.

### A Racing Track.

SEVERAL times during the last few years has the suggestion been made for the establishment of a motor-car track whereon automobiles could disport themselves at extraordinary speeds without danger to the admiring public. So long ago as in June, 1900, we remarked that "the provision of an automobile track is a matter of great importance to automobilism in meeting the need for the organisation of motor sports and pastimes on a thoroughly representative scale." Discussing the conditions for success, we urged the adoption of a bold policy in securing a track with varying gradients as well as straight runs, and with such a long course that competitors should be saved the feelings that are experienced by fishes in a globe. There should be nothing of the cramped and cabined character where motor-car speed is concerned. These desiderata seem to have been secured in the track which is shortly to be opened near Weybridge, and where a dozen important race meetings will be held next year on dates which are given in our article on another page. In addition to the races there notified a prize known as the "Progress Plate" will be offered with a view to encouraging useful improvements in the mechanical propulsion of vehicles. Many of our readers will also be interested in the offer of a prize of £25 for any new suggestion for a Progress Plate, which, having been approved by a board of technical experts, is adopted by the committee.

### Fire at Glasgow.

THE garage of the St. Vincent Motor and Cycle Company, Ltd., in North Street, Glasgow, was the scene of a serious fire one night last week, the damage to fourteen cars out of eighteen being between £5,000 and £6,000. The

Company was fortunate inasmuch as the fire did not spread to the workshops or showrooms, where there were eighteen other cars under repair. An interesting fact with regard to this fire is that all their own make of cars, viz., the Scottish Aster and St. Vincent, contained as much as five and seven gallons of petrol in the tanks, and although the bodies are absolutely destroyed, the tanks kept the petrol intact, no explosions and no petrol catching fire at all. This seems more remarkable when one takes into consideration that the cars must have been

at a very high temperature, for the fire lasted from 9.30 till 12 p.m. We give a photograph of a corner of the garage after the fire, in the foreground of which is a Wolseley car, a St. Vincent vehicle being behind it.

### The Supply of Petrol.

DR. P. DVORKOVITZ has been giving his views on the supply of petrol to the Fuels Committee of the Motor Union. He does not believe that there are any signs of a falling off in the supply for at least a generation or two, and points to the fact that since last spring new fields have been opened up which have increased the available supply of crude oil by a third. In distilling crude oil to obtain illuminating oil, petrol is produced as a by-product, and it does not pay to distil crude oil merely to produce petrol. If, however, the price of coal is high, a good price can be obtained for liquid fuel, hence it pays to use liquid fuel in the form of crude oil without any distillation, and consequently no petrol is produced. The remarkable feature in the problem of the petrol supply is that the demand for petrol has hitherto not been a serious factor in the matter of its output. In some territories as (Group 1) Pennsylvania, Ohio, Roumania, North Caucasus, and Dutch India (Sumatra), the distillation is regulated by the price of illuminating oil. In other districts as (Group 2) Texas, Kansas, California, Indian Territory, Baku, and Borneo, the amount of distillation is regulated by the price of coal. About 60 per cent. of the whole world's production of crude oil is obtained from the latter-mentioned fields, and 40 per cent. from those mentioned in Group 1.

### A Question of the Standard.

THE whole supply of petrol comes only from Group No. 1, the crude oil from which fields contains about 10 or 12 per cent. of petrol. The other fields in Group 2, however, yield an oil containing at least 5 per cent. petrol, but owing to the present unscientific and erroneous (from a practical point of view) method of estimating the quality of petrol, these valuable fields mentioned in Group 2 are, unfortunately, closed. Not only do what may be called the closed fields (closed owing to this unfortunate standard) produce 60 per cent. of the world's total supply of crude oil, but they are the very fields which are being more and more developed, whereas the other group of fields are falling relatively behind, inasmuch as investors prefer to put their money rather into fields which supply fuel than into the fields which chiefly supply illuminating oil, as in Group 1. The petrol excluded by the unfortunate specific gravity already mentioned would be equally good and satisfactory for use with motor-cars with that now in vogue. Dr. Dvorkovitz says he is in a position to state that drivers of motor-cars are unable to tell the difference, if they do not know the kind of petrol they are using; and he believes that the whole question at the present moment is more a matter of custom rather than anything else. If users were to adopt a more rational standard it would open up this new and large source of petrol supply. The area of supply would be extended over the whole world instead of being limited, as at present, to one set of fields. Even now there is no monopoly; far from it, a fairly keen rivalry exists. If there is any monopoly, however, then it is that produced by the adoption of the present standard by the users themselves. The high price of petrol he attributes partly to the artificial standard and partly to high railway tariffs, and also vexatious regulations of the public authorities.

### Motor-Car Imports and Exports.

AN upward tendency is still noticeable as regards the importation of foreign-built cars into this country. According to the returns now available no less than 352 cars, valued at £180,062, were imported during last month; parts were responsible for a further sum of £15,599, giving a combined total of £351,661, which compares with only £275,200 in November, 1905. As regards the imports during the first eleven months of the current year, these have amounted to 5,553 cars, worth £2,385,261, and parts to the extent of £1,764,285, the aggregate of £4,149,546 contrasting with only £3,162,378 in the first eleven months of last year, or an increase of nearly a million sterling. Turning now to the exports of British motor-cars and parts, these, during November last, amounted to £102,971. For the first eleven months of 1906 the shipments comprised 1,224 cars, valued at £437,837, and parts estimated at £280,749, the total of £718,636 representing an increase of £282,428.

### The Rules of the Sport.

THE Racing Rules of the Brooklands Automobile Racing Club, which have been approved by the A.C.G.B.I., are ninety-six in number, and have been issued in a striking black and yellow cover. Among the most interesting are those prohibiting the entry of vehicles having their exhausts so directed as to raise dust from the road surface, and defining the system of classification by (a) weight and (b) price. In connection with the latter section, makers entering vehicles of a stated selling price must give written guarantees as to their ability to supply the public with identical vehicles at the entered price, which, up to £350, will be taken to mean the price of the vehicle complete ready for the road; over that amount the chassis price only will be required with the entry. To carry out the contests the Club will require the appointment of three stewards, a judge, a starter, a clerk of the scales, a clerk of the course, timekeepers and handicappers, as well as a secretary of the meeting. Provision is made for dealing with competitors (who must have been registered by the Club) who are guilty of

corrupt practices, or who make false statements on the entry forms. Altogether the regulations appear to have been drawn up with care, and from a preliminary examination we do not yet see that the proverbial "coach and four" can be driven through them. They should, in fact, do something to establish motor-car racing on the track as a new attraction for the British lover of sport.

#### The Vacation.

To many sections of the motor trade Christmas will come as a welcome relief from a long and fatiguing season, to which the vagaries of the weather have contributed not a little unpleasantness. Many firms are closing practically all next week, probably the longest vacation in the business being that of the Electric Ignition Company, Ltd., of Birmingham, whose works will be shut down from to-day (Saturday) until the last day of the year.

#### Club Meetings.

MANY of the provincial clubs seem to have been anxious to get their collective dining over before the season of family festivity, and this week we give reports of the dinners of the Hartlepool, Mid-Staffordshire, Yorkshire, and other automobile clubs. The point of similarity among all these associations that cannot fail to strike the reader is the universal story of success. Commencing with a few enthusiasts, they have grown into influential local organisations, and personalities of municipal and county importance are attracted to their tables. Scarcely a club called into existence by enthusiastic motorists has failed to justify its existence, and those that appeared to languish have become merged into other associations, attaining to greater strength in the process. All this may prove satisfactory to the club-man, who, in addition to developing his social instincts, has the knowledge that he is helping to foster a great industry and a growing movement.

The Gros-Borderel Six-Wheel Vehicle outside the Paris Salon.]

#### A Joke Explained.

ON Saturday the Birmingham Law Students dined together, with judges and scientists as the speakers of the evening. Mr. Justice Jelf was judicially serious, and devoted his time to describing motor-cars as "monstrosities" that polluted the streets with noise and smell, and then declared that from his coign of vantage on the Bench he was able to say that the drivers of automobiles were as frequently in the right as were the owners of horses. After that legal pronouncement Sir Oliver Lodge spoke on the subject of motor-cars, and said it had been rumoured that "acetylene" was going to supplant petrol. That, he added with a smile, was nothing new, for we used to run vehicles with "a set o' lean" horses. At this season of the year punning is evidently allowable at Birmingham. We may forgive Sir Oliver for his lapse into humour, for, later in his speech, he emphasised the point that motor-cars, being of mechanical construction, were more easy to steer accurately and more likely to respond to the desires of the driver than was any animal that had a will of its own.

#### Steam v. Petrol.

ON Friday last week the subject of steam as a motive power for public service vehicles was again under discussion at a meeting of the Institution of Mechanical Engineers. Professor Hele-Shaw bestowed great praise upon the ingenuity displayed by Mr. Clarkson in the design of his motor-bus chassis, while Inspector Bassett, of Scotland Yard, indulged in what he described as "destructive criticism." It was evident that at present the authorities are more inclined to regard the petrol bus with favour than its steam rival, although they have passed many steam buses for public service. During the course of the discussion it was mentioned that some four years ago a small company, with a capital of £5,000, had been formed at Torquay to run the steam buses in that town. For the last three years it has paid 7½ per cent. dividend, and has carried forward £2,400. Meanwhile £80,000 has been spent upon tramway plant for Torquay, and not a tram has yet been run. Evidently local experience is that motor-buses are more profitable.

## SEVEN YEARS AGO.

## Roads in Devon.

IN our Correspondence columns, Mr. Evan B. Jeune, of the Manor House, Lynmouth, draws attention to a road improvement of local importance and national interest. An opportunity has occurred to connect Lynton and Lynmouth with the south and east by means of a road having a reasonable and practical gradient, in place of the almost impossible one of 1 in  $4\frac{1}{2}$  as at present. Earl Fortescue has offered the land for the road, which will obviate the notoriously dangerous Barton Steep and allow the avoidance of Porlock and Countisbury Hills, and if a sufficient sum can be obtained by private effort, it is probable, with the aid of the Devon County Council, the work may be carried out. The cost will be between £700 and £800, and of this about one-third will be required from private sources. When we have a Central Road Authority to keep an eye upon the arteries of the country such improvements will be regarded as a national care; meanwhile, we suppose, private generosity must carry out such works which will be of common utility. In the present case the subject is of considerable interest to all who ever motor in fair Devon, and to such a large section of our readers the appeal of Mr. Jeune, supported by Sir George Newnes, M.P., and other public men, should not be in vain.

## The Tar-spraying Competition.

THIS week the rules for the tar-spraying competition to be conducted by the Roads Improvement Association have been finally considered, and we were glad to learn that the General Purposes Committee of the Motor Union have impressed upon the committee the necessity of reminding competitors that the points to be secured are greater economy as compared with the present expensive system of applying tar, both with regard to money cost and time occupied. It must also penetrate deeply into the road, acting as a binding, to secure which result the distribution must be uniform. It has been agreed that the expenses of the competition are to be jointly borne by the Automobile Club and the Motor Union, and the latter is now appealing to the federated clubs to contribute towards its moiety. Some of the people who have lately railed against the dust nuisance might also be invited to give practical evidence of their earnestness in the matter.

## Forming Public Opinion.

WE have received from the Motor Union an official copy of the resolutions embodying the legislative policy of the organised motorists of the United Kingdom, which was fully set forth in our columns of November 24th last. It will be remembered that the General Committee of the Motor Union, which includes the elected representatives of the A.C.G.B.I. and eighty affiliated clubs, adopted certain resolutions with reference to the recommendations of the Royal Commission on Motor Cars, after consideration of the report and suggestions of the National Conference of Automobilists, held at the Hotel Great Central on the tenth anniversary of the Motor Car Act. The document before us sets out in detail the various recommendations of the Royal Commission, with the resolution in respect of each recommendation adopted by the Motor Union. We understand that any automobilist who desires to communicate with his representative in Parliament or on the Local Authority with regard to motor matters can obtain a copy of these resolutions on communicating with the secretary of the Union. A note appended to the publication states that further particulars of the legislative policy of the Motor Union, together with statistics or precise information upon any particular point, will be furnished to any Member of Parliament, county or borough councillor or public official who desires to make himself fully acquainted with any aspect of the motor and road problems, upon application to the secretary of the Union at 1, Albemarle Street, Piccadilly, London, W.

AUTOMOBILE history has been quickly made. Few industries have had their early days so fully and so faithfully recorded as that associated with the motor-car. Participants of its progress and observers of its youthful antics have given their impressions in print so many times that the story is as familiar to the general reader as is that of Robinson Crusoe to the small child of the nursery. Every man who can write, and many whose performances in that direction have been somewhat illusory, has told the tale of roadside troubles and vainglorious travels. And still the publishers continue to send forth a flood of such literature from the reservoirs of remembrances filled by enthusiasts who love to talk of the "good old days," when the uncertainties of motoring entitled it to be regarded as sport.

We do not intend at this festive season to disturb the memories of ancient times, but a glance at the issue of the *M.C.J.* for December 22nd, 1899, exactly seven years ago, has occasioned some amusement as well as revived recollections as to the dearth of actual news in those days. The rumour as to a service of public motor vehicles being started in the Windsor district was given all the prominence of large type, and with equal boldness the announcement was made that a new single-cylinder 12-h.p. car, weighing less than 6 cwt., was being built for the 1,000-mile trial which Mr. C. Johnson was then engaged in arranging. He had had a cool time that week, but managed to travel 322 miles in three days without a breakdown, the journeys including a run from Bristol to Birmingham and thence to Coventry (75 miles), "without meeting a single vehicle." Other interesting trips in December, 1899, were those of Miss N. G. Bacon from London to Brighton in three hours and a half on a Werner motor-bicycle, and Mr. A. Jordan's run on the same route on an electrical car without recharging the batteries.

In the same month the Coventry Technical Instruction Committee declined to provide motor-car classes, feeling "it to be imperative to relegate the matter to a period when the financial position is more sound"; the War Office refused an offer of a free trial of motor-lorries, and the A.C.G.B.I. was suggesting the education of public authorities by the provision of opportunities for riding in cars, while the efforts of horse owners to secure an attitude of equine indifference to automobiles were then recorded with approval, and at length.

Perhaps the most noteworthy evidence of official prescience in those late days of 1899 was seen in the encouragement given by metropolitan borough surveyors to heavy traffic. Mr. T. W. Higgins, of Chelsea, issued a report on the subject, which not only convinced his own Council but also did something to arouse the interest of other bodies in the subject of the more efficient and economical carrying out of municipal road work, while Mr. Weaver, of Kensington, was, even then, voicing the view that the remedy for the dust in London streets was the universal adoption of motors. To facilitate their adoption in his borough he had already begun to employ a finer material in sanding the roads than formerly, and generally welcomed the hopes of cleaner streets that the coming of the automobile seemed to indicate.

This brief reference to seven years ago seems to emphasize how rapidly the movement has grown, and although the sanguine anticipations of the last-named authorities have not been realised in their entirety, the War Office and the technical instruction experts have now been aroused to the existence of the new force that is exerting a powerful influence on our national life—transforming the conditions in many avenues of employment and bringing about a complete change in more ways than are immediately apparent to "the man in the street."

MESSRS. ATKINSON AND PHILIPSON, of Pilgrim Street, Newcastle-on-Tyne, have issued a neat list of the motor-car bodies made at their carriage factory. Their specialities include a Cape cart hood of good design.

## ELASTES—A NEW DEPARTURE IN TYRES.

IT is close upon eighteen months since we drew the attention of motorists to the introduction in France of a new artificial rubber, designed to take the place of air in the inner tubes of motor tyres. Since that time many experiments and trials have been in hand, with the result that not only is the material being commercially manufactured in France, but a very strong concern, known as the Elastes Company, Ltd., has been formed in this country to exploit the new substance. Briefly described, Elastes is an artificial rubber manufactured from glycerine, gelatine, and chromic salts, by a special process. When originally prepared it is in a liquid form, but gradually it sets into a stable and extremely resilient substance which is neither affected by water nor by any reasonable changes of temperature. Although the new substance can be employed in many ways in place of rubber, the company are at present devoting attention to popularising its use in place of air in the inner tubes of motor tyres, so rendering them equally free from puncture troubles as a solid tyre, whilst retaining all the advantages in the way of resiliency of the pneumatic. The compound is forced through the ordinary air valve into the inner tube of a motor-car tyre fitted in its outer cover and mounted on a rim. The proportions

weight or temperature to which it may be subjected, that long use does not affect it, and that it has no tendency either to become hard or disintegrated—in fact, so long as it is not exposed to actual friction, it may be used over and over again.

With the view of testing the running qualities of tyres filled with the new material, we were on Saturday last, in company with a number of other representatives of the Press, invited by the Elastes Company, Ltd., to a trial trip as far as Chertsey and back. On the outward run we travelled on an old 16-h.p. Napier. The route followed afforded samples of every variety of road surface, and included the passage over the frozen ruts of the gravel in Richmond Park, with the result that the tyres were found equally as resilient and easy-riding as pneumatics. Indeed, had we not known otherwise, we should have thought we were, as usual, on air-inflated tyres, as no difference could be discerned even in the hill-climbing qualities of the car. At Chertsey, Mr. J. F. Ochs, one of the directors of the new company, entertained the visitors to lunch at his residence, St. Anne's Hill, a historical old place, seeing that it was for many years the residence of that great statesman, Charles James Fox. The return to town was made on a fully-loaded six-seated 32-h.p. Siddeley car, the journey again proving a success, the sensation of freedom from worry as to possible punctures and delays on the road, especially at this time of the year, being a delightful one.

The Start of the Trial Run of Cars fitted with Elastes Tyres.

of the ingredients and the pressure with which it is forced into the tube, which when filled is known as a *boyau*, vary according to the weight, horse-power, and speed of the car for which it is destined. The tyre having thus been filled and properly distended is put aside for about ten days to allow the substance to set.

The material is of course heavier than air, adding from 10 to 40 lbs. to the weight of each wheel, according to the size. It must be remembered, however, that by the use of Elastes tyres it is unnecessary to carry either spare covers and tubes on the car, or tyre repair outfits, levers, inflators, &c., which are not only in the way of the passengers, but counterbalance the difference in weight between them and Elastes, so that the total weight of the car is not increased. Again, although Elastes adds considerably to the original cost of a set of tyres, yet the use of it in reality effects a saving in running cost; for it is found that the outer covers will last much longer, and can be quite worn out before needing renewal. The tyres always remain properly distended, and any cuts in the cover have no tendency to increase, so that by the time one set of covers has been worn out the expense of Elastes has been more than saved. In addition to this it is possible to again use the Elastes-filled tubes with new covers, as it is claimed that the nature of the substance is such that it will retain its consistency under all variations of

At present it is necessary for motorists wishing to have their tyres adapted to Elastes to send them to the company's depot at 79 and 80, York Street, Westminster, but arrangements are in hand for the establishment of branches in all the principal towns of the country where the tube-filling operation can be carried out.

ONE reason why the Palmer Cord Tyre has been reduced in price is accounted for by the cleverly-devised cord-laying machines lately introduced. A pair of these machines will cord ten tyres with perfect regularity in the time taken by the old process for one tyre, each cord being measured off to the exact length required, so that there is an equal tension of threads throughout the tyre.

THE "Validus" combination non-skid is the subject of a new list just issued by the Validus Non-Skid Motor Tyre Co. In this the hardened steel studs pass through a toughened leather surface tread and then through the main portion of the band, which consists of five layers of rubber with four intermediate layers of canvas. There is a length of chrome leather underneath this band to secure the studs. Before fitting the Combination Non-Skid a piece of rubberized chrome leather is vulcanized on to the tread of the tyre, thus preventing the backs of the studs from chafing the same.

# The Paris Motor-Car Exhibition.

(Continued from page 927.)

## SOME NEW ITALIAN CARS.

**T**HE Paris Show, which comes to a close on Monday evening next, has throughout the week continued to attract large crowds, included among which have been a good number of English visitors. Reference was made in our last issue to the fact that one striking feature of the exhibition is the large number of high-grade cars of Italian construction on view. There is no question that Italy is making extremely rapid progress in the world of automobile construction, and that the country promises to become a serious rival to France. Last week we dealt with the exhibits of the Isotta-Fraschini and Marchand concerns, while below will be found a brief description of the other Italian cars on view, they having been grouped together with the idea of giving some slight indication of the important position the industry in Italy has attained.

### The Italian "Standard" Car.

A newcomer from Italy is the SOCIETA FABBRICA AUTOMOBILI STANDARD, of Turin, which is at present confining its attention to a 10-14-h.p. four-cylinder live axle car. While

Fig. 28.—Sectional View of Live Axle of the Italian Standard Car.

the usual arrangement of such vehicles is followed, there are one or two interesting features in the car. The cylinders are cast in pairs, and are 85 mm. bore by 110 mm. stroke; high-tension magneto ignition is fitted, and the lubrication is by means of cam-actuated plunger pumps, the lubricator being mounted on the dashboard. The clutch is of the metal-to-metal expanding type, and the four-speed change-gear is operated by a "gate" lever. Coming now to final transmission; the short shaft, which immediately follows the cardan shaft, is carried right through the differential casing, in which it is supported at both ends; the differential itself is mounted in the centre of this longitudinal shaft, which is provided with two bevel pinions, each meshing with a bevel crown attached to its corresponding half of the live axle (Fig. 28). Among the advantages claimed for the arrangement are that it prevents any "sag" in the axle, that it permits the rear wheels to be splayed, and also that each half of the axle may alter its position to the other, due either to the load or to irregularities of the road, without throwing any strain on the differential pinions.

### The Junior Cars.

LA FABBRICA TORINESE AUTOMOBILI JUNIOR, of Turin, are making two sizes of four-cylinder cars, 18-24-h.p. and 28-40-h.p., both being chain-driven. The engine has the four cylinders cast in pairs, and the valves on opposite sides. The ignition is by low-tension magneto ignition, the igniters being operated by horizontal cams mounted on vertical spindles. In the larger car the lever on the steering wheel, which is connected with the ignition, is so arranged that as the latter is retarded a half-compression device is brought into action to facilitate starting the engine. The carburettor has an inter-connection between the hand-operated auxiliary air valve and the petrol jet. The clutch is of the multiple-disc type, and the gear-box, which is controlled by a lever working in a "gate," gives four forward speeds and a reverse.

### The Esperia Cars.

One of the most interesting of the new Italian cars is the Esperia (Fig. 29), made by LA SOCIETA AUTOMOBILI LOMBARDA, of Bergamo. Two models are being made—20-h.p. and 40-h.p. The smaller one has the four cylinders all in one casting with the valves on one side, while on the 40-h.p. they are formed in pairs. The ignition is by low tension magneto, provision being made for easy adjustment of the make and break tappets, and for observing the spark without disturbing any of the parts. The engine lubrication is maintained by a pump. A feature of the motor is its freedom from piping; there is but one induction inlet, one water inlet from a large centrifugal pump, and one outlet direct to the radiator. The clutch, which is of the multiple disc type, is not combined with the flywheel, as usual, but is in a forward extension of the gear-box. The change-speed gear is operated by a "gate" lever, and the final drive is by a special design of live axle. The sleeve enclosing the latter is of steel tubes formed in one with the bevel gear casing. The road wheels, which run on this casing, receive the power in the hubs through dog clutches on the end of the rotating axle. The casing surrounding the cardan shaft is supported by the gear-box through a link, the hinge being concentric with the axis of the universal joint on the end of the cardan shaft. Two rods are also fastened to this link at the forward end and to a transverse member of the main frame at the rear. There are several other points of interest in the "Esperia" vehicle, on the design of which great thought and ingenuity has been devoted.

### The Florentia Cars.

Principal interest at the stand of the FLORENTIA COMPANY, of Florence, Italy, now represented in England by Messrs. M. de Brou and Co., Ltd., is the chassis of the 18-24-h.p. car. For the 1907 season three models are being made—18-24-h.p. with a live axle or side-chain transmission, and 24-30-h.p. and 40-50-h.p. chain-driven. Dealing first with the live axle machine (Fig. 30), it may be mentioned that the four cylinders, which are cast in pairs, are 100 mm. bore by 140 mm. stroke. The valves are located on opposite sides, and the ignition is by high-tension magneto. The mixture is furnished by a special design of automatic carburettor. The radiator is of the honey-comb type, air being induced through the same by a fan formed in the fly-wheel. The clutch in the new model is of the multiple disc type, and the change-speed gear, which is controlled by a lever working in a "gate," is adapted to give four speeds forward and a reverse, with direct drive on top speed; the final transmission is by a cardan shaft and bevel gear to a live axle; the latter has only the driving strain to withstand

Fig. 29.—Plan of Chassis of Esperia Car.

the drive to the rear wheel hubs being by the square ends of the axle, the weight of the car being carried by the sleeve. The usual dumb irons at the rear are replaced by halves of semi-elliptical springs. We may add that ball bearings are used throughout except the engine. The 24-30-h.p. car is, generally speaking, on similar lines to the 18-24-h.p., except that the transmission is by side chains. Ignition is, however, by low

tension magneto, and the clutch is of the metal-to-metal expanding type. Two brakes are provided on the countershaft, in addition to those operated by a hand lever and acting on the rear road wheels. In the 40-50-h.p. car the cylinders, which are 140 mm. bore by 160 mm. stroke, are separately cast. The frame, too, is worthy of notice; it is of pressed steel, with the cross members electrically welded in place, no rivets being employed.

"parallel motion." In other words, the back axle is tied to the frame in very much the same way as one bar of a parallel ruler is connected to its fellow. This has the result of keeping the axis of the driving pinion on the rear end of the cardan shaft always pointing in exactly the same direction, no matter what may be the relative position of the frame to the back axle. Both foot and hand operated brakes are fitted, a noteworthy point of

Fig. 30.—Elevation of Chassis of Florentia 18-24-h.p. Car.

#### The Rapid Cars.

LA SOCIETA TORINESE AUTOMOBILE RAPID, whose cars are already well known in England, give prominence to a beautifully finished 50-70-h.p. chassis (Fig. 31). The engine comprises four separate cylinders, 140 mm. bore by 160 mm. stroke, with the valves arranged on opposite sides. The usual arrangement of live-axle cars is followed, the details comprising high-tension magneto ignition, mechanical lubricator, multiple-disc clutch, and "gate" change-speed gear. The joints on the cardan shaft are of a specially large design; they have a sliding as well as a universal action, and comprise a phosphor bronze sphere working between the forks on the two shafts to be connected together. The radius rods at the side of the frame are arranged horizontally, being supported at their front end on special brackets. The torque rod is attached to the upper part of the differential casing at one end, and to a transverse member of the main

the contracting brake behind the gear-box being its unusually large width. A new 12-h.p. two-cylinder chassis on similar lines, and designed for use as a town carriage, is also shown.

#### The S.P.A. Cars.

Among the newcomers from Italy whose cars are likely to be much heard of in the future is the SOCIETA PIEDMONTESE AUTOMOBILI ANSALDI-CEIRANO, of Turin. Two sizes are on view, a 40-h.p. four-cylinder and a 60-h.p. six-cylinder, both having live axles. Except as regards the number of cylinders, the two vehicles are identical as regards the details, so that the following particulars may be taken as applying to both. In the first place it may be mentioned that the object of the designer has been to so arrange the leading components that any of them may be readily detached without disturbing the others. The cylinders, which are 130 mm. bore by 135 mm. stroke, are cast in pairs, and have the valves arranged on opposite sides. The ignition

Fig. 31.—Plan of Chassis of Rapid 50-70-h.p. Car.

frame at the other, and it, like the radius rods, lies in a horizontal position. The forces which it counteracts are such as to put the metal in a state of compression. At first sight it may not be quite obvious that this arrangement of radius rods and torque rod is anything but a matter of constructional convenience. A little closer investigation, however, shows that the two radius rods and the torque rod combine to form a simple type of

is by high tension magneto, one cam operating the make and break for two cylinders. The clutch is of the multiple disc type, and the change-speed gear has "gate" control.

#### The F.L.A.G. Cars.

To form the name of the car out of the initial letters of the title of the manufacturing company appears to be quite the fashion in Italy. Another concern which has adopted the plan

is the **FABBRICA LIGURE AUTOMOBILI**, of Genoa, who display two sizes of F.L.A.G. cars, a 16-h.p. live axle vehicle and a 40-h.p. chain-driven machine. A feature of the engines, which comprise four cylinders cast in pairs, with the valves arranged on opposite sides, is the provision of ball bearings on the crank shaft. The clutch is of the multiple disc type, and the change-speed gear is controlled by a "gate" lever. The gear-box on the 16-h.p. car is of relatively small dimensions, and is supported from the cross members of the frame at two points only. The 40-h.p. vehicle is provided with double brakes on the counter-shaft, both being enclosed.

Fig. 32.—Chassis of Fiat 12-16-h.p. Car.

#### The Fiat Cars.

As usual, the **FIAT COMPANY** have an attractive display. For the coming season four sizes are being made—12-16-h.p., 18-24-h.p., and 30-40-h.p. four-cylinder and 60-h.p. six-cylinder. The latter naturally attracts considerable attention, but as we described it in our report of the Olympia Show it need not be further referred to on the present occasion, except to mention the new self-starting apparatus and the improved carburettor. The feature of the latter is that the petrol and supplementary air ports are moved together by a single automatic movement, which not only assures a constant mixture, but also tends to reduce the petrol consumption to a minimum. In fact, the high efficiency to which the new carburettor has been brought is claimed to give increased brake horsepower with less consumption of petrol than in former models. The clutch and change-speed gear are on the usual Fiat lines, the final transmission being by side chains. Fig. 32 depicts the chassis of the new 12-16-h.p. four-cylinder vehicle designed for town use, and in which a number of special features are comprised. To begin with the frame. This is dropped in the centre to give a low side entrance, and is made of extra large section just behind the dashboard. It is in the transmission, however, that the principal novelty lies, the differential mechanism being immediately behind the gear-box. There are two cardan shafts, one within the other, each driving one half of the rear live axle. The shafts are carried in an oil-tight tubular casing, each engaging with a bevel wheel within the live-axle casing, the latter being constructed of pressed steel, the two halves being bolted together vertically. As will be seen, the new arrangement is quite a radical departure; and although the Fiat Company may be relied upon not to put anything on the market without having previously given it extensive trial, we shall be interested in watching its behaviour on the road.

#### The Bianchi Car.

Messrs. **BOUSQUET AND Co.**, the French agents, exhibit a chassis of the **Bianchi 40-h.p. car**, built by Messrs. **E. Bianchi and Co.**, of Milan. The engine, which comprises four cylinders, with the mechanically-operated valves arranged on opposite sides, now runs with a somewhat higher compression than hitherto. The cam gear and governor are entirely enclosed. The clutch is of the multiple-disc type; four speeds and a reverse are controlled by a lever working in a "gate." The change-speed gear-box and differential cases are in one casting, and attached to the frame by three-point suspension; the final drive is by side chains.

#### The Itala Cars.

One of the stands to which it is difficult to gain access, owing to its popularity, is that on which the **Itala car** is exhibited. This Italian-built car has come rapidly to the front during the past year or so, and is now represented in Paris by **M. Henri Fournier** and in this country by the **Itala Automobiles, Ltd.** The great centre of interest is the chassis of the new 60-h.p. six-cylinder car, which, except as regards the engine (of which we give a view in Fig. 33), follows the usual lines adopted by the **Itala Company**, the transmission being by a cardan shaft to a live axle. As will be seen, the motor is exceedingly compact; in fact, it is claimed to have the shortest over-all length—3 ft. 6 in.—of any "six" in the Show. As in the four-cylinder cars, the cylinders are cast in pairs, and the valves are mechanically actuated by separate cam shafts. The ignition is by **Simms-Bosch** low-tension magneto. The clutch is of the metal disc type, and the gear-box is arranged to give four speeds and reverse, operated through a "gate" lever. The cardan joints have metal cup protectors, and ball bearings are fitted throughout. The foot brake between the clutch and the gear-box is no longer provided, but the pedal previously used to operate it has been retained, it being now coupled up to the brakes on the rear wheels, which are also operated by a side-lever. The water-cooled foot-brake behind the gear-box is of course still fitted. The steering connections are all of the ball-and-socket type, a simple means of adjustment being provided.

#### Some other Italian Cars.

Other Italian cars exhibited include the **Zust**, represented in England by the **Farman Automobile Company**. The chassis on view is a 28-40-h.p. four-cylinder, the features of which we referred to in our report of the Olympia Show. The **FABBRICA DI AUTOMOBILI BRIXIA-ZUST**, of Brescia, apparently an offshoot of the **Zust Company**, exhibit an 18-24-h.p. car on very similar lines, the transmission being, however, by a cardan shaft to a live axle. The "**Hisa**" car of the **HERMES ITALIANA SOCIETA AUTOMOBILI**, of Naples, is of 24-28-h.p., and is on the standard lines of live axle vehicles, a noteworthy point

Fig. 33.—The Itala Six-cylinder Motor.

being the relatively low price at which it is being put on the market. A feature of the **Aquila cars** made by the **FABBRICA AUTOMOBILI AQUILA ITALIANA**, of Turin, is that the engines, even in the six-cylinder model, are all in one casting. Four sizes are being made—12-16-h.p. and 28-40-h.p. four-cylinder and 18-24 h.p. and 60-75-h.p. six-cylinder. The vehicles are all of the live axle type, the details comprising low tension magneto ignition, multiple disc clutch, and "gate" control of the change-speed gear, which gives a direct drive on the top speed.

## FRENCH CARS.

**The Delaunay-Belleville Cars.**

For the 1907 season the Delaunay-Belleville cars, represented in England by the BURLINGTON CARRIAGE CO., LTD., are being made in three sizes, 20-h.p., 28-h.p., and 40-h.p. The 1906 models having given every satisfaction, very little change is discernible in the 1907 chassis, the alterations being confined to small details. The 20-h.p. car is supplied with either live axle or chain drive; the others are provided with the latter. The engine has four separate cylinders, with the inlet valves arranged on one side and the exhaust valves on the other, all

Fig. 34.—Chassis of Westinghouse 20-30-h.p. Live Axle Car.

being mechanically actuated. The bore of the cylinders is somewhat larger than in the 1906 models, so that the power is greatly increased. An additional air-inducing fan is incorporated in the flywheel, and extra louvres are formed in the casing under the chassis. The ignition is by magneto, while the water circulation is maintained by a gear-driven centrifugal pump and a framed ribbed-pipe radiator of the special Delaunay circular shape. The engine is lubricated by oil fed under pressure by a valveless oscillating pump, driven off the crank shaft. The main oil tank, which supplies the base chamber, has been enlarged to double the former size, so that the refilling process is not of such frequent occurrence. The power is transmitted through a leather-faced cone clutch and gear-box giving four speeds forward and a reverse. Ball bearings are used throughout, with the exception of the engine.

**The Westinghouse Cars.**

A good deal of attention is just now being centred on the cars of the WESTINGHOUSE COMPANY, owing to the success of their two vehicles in the recent Paris-Monte Carlo-Paris reliability trial. Two models are being made for next year, the 35-40-h.p. chain-driven vehicle being supplemented by a 20-30-h.p. live axle car intended for town use. The larger machine shows but few changes from last year. The engine comprises four cylinders cast in two pairs, with the valves mechanically actuated off separate cam shafts. The carburettor, low tension magneto, and pump are all mounted on the engine. The governor is enclosed in the crank chamber; it acts on a piston throttle regulating the admission of gas to the engine, an accelerator pedal being also provided. The clutch is now of the metal-to-metal disc type, and is so arranged that it can be removed without interfering with the engine or the gear-box. The latter is adapted to give four speeds and a reverse, with direct drive on top speed. Large diameter foot brakes are provided on the differential shaft, as also a hand brake acting on the hubs of the rear wheels. All the brakes are so arranged that they can be adjusted by hand. Except as regards the transmission and the ignition, which is by high-tension magneto, the 20-30-h.p. vehicle (Fig. 34) is on similar lines to the 35-40-h.p. The frame is raised at the rear to clear the differential, and a transverse spring supplements the usual longitudinal pair. The hind road wheels run on the axle sleeve and receive the power from the live shafts through the hubs. The cars are fitted with a new shock damper, in which an oil-containing inverted cylinder is mounted on the rear axle, a piston rod, working in the same, being bolted rigidly to the side members of the frame. Altogether the Westinghouse cars

make a favourable impression, the workmanship well upholding the reputation of the company in other branches of engineering work.

**The Herald Cars.**

The HERALD COMPANY, of Levallois Perret (Seine), are now turning out four sizes of cars, all having four cylinders, ranging in power from 12 to 40-h.p. Dealing with the 18-h.p., as being a typical model, the engine comprises four separate cylinders of 98 mm. bore by 115 mm. stroke. The valves are interchangeable and placed on the same side of the engine. The mixture is furnished by a Tourand automatic carburettor, and the ignition is by high tension magneto. Large inspection covers are fitted to the base chamber to permit the "big ends" to be readily examined. The clutch is of the leather-faced cone pattern, and the gear-box, which is located well to the rear, is adapted to give four speeds and a reverse. Transmission is by side chains to the rear road wheels, which are mounted on ball bearings, as are also the front wheels. The frame is bent upwards over the rear axle, so as to form a suitable support for the double elliptical springs, which are a special feature of the Herald cars, and one which adds considerably to the easy-riding qualities of the same.

**The Vulpes Cars.**

The VULPES COMPANY are now turning out cars ranging from 8-h.p. two-cylinder to 30-40-h.p. four-cylinder, which, generally speaking, are on standard lines. The new engine, however, is interesting, first, because of its base chamber being in one with that of the gear-box, thus forming one block, and, secondly, in the arrangement adopted for the operation of the valves. The same method is also employed on the two-cylinder motor. From the accompanying illustration it will be seen that the usual camshafts are replaced by short shafts fixed across the engine, one between each pair of cylinders, and operated by worm gearing direct off the crank shaft. On one end of each shaft is mounted a cam, which takes effect upon the lower end of the perpendicular arm of a bell-crank lever on each side, both the inlet and exhaust valves being thus lifted by the

Fig. 35.—The "Simplex" Motor as fitted to Vulpes Cars.

medium of a single cam. The shaft is extended outside the case and carries the contact maker on its extreme end.

**The Guillerme Car.**

M. F. GUILLIERME, of Paris, shows a 10-12-h.p. live-axle car in which several special features are comprised. The engine has the four cylinders, 70 mm. bore by 120 mm. stroke, in one casting, the ordinary type of suction valve being employed. The carburettor is of the Xenia automatic type. The speed of the engine is entirely regulated by the foot by means of a combined press down button and lateral-moving

pedal. The latter moves on an inclined plane, and fixes the speed of the engine according to its position. By means of the button immediately forward of the pedal the motor can be instantly accelerated when necessary, as, for instance, when driving in traffic, the throttle opening, once the pressure on the button is released, returning to the position permitted by the sideways-moving pedal.

#### The Rochet-Schneider Cars.

The ROCHET-SCHNEIDER COMPANY, represented in England by Messrs. Donne and Willans, are now building an extensive

Fig. 36.—View of Engine of the Rochet-Schneider 16-20-h.p. Car, showing lubricating oil tank behind radiator.

range of cars, comprising 16-20-h.p., 20-24-h.p., 30-35-h.p., and 40-50-h.p. four-cylinder and 30-40-h.p. and 45-60-h.p. six-cylinder. The first two have live axles and the others side chain drive. A polished chassis of the 16-20-h.p. type is on view, and is attracting considerable attention. The leading features of the new models having already been given in our report of the Olympia Show, we need only mention that the valves, which are mechanically operated and interchangeable, are located on opposite sides of the cylinders. To facilitate starting the three larger sizes of motors are fitted with an independent half compression device. In the 16-20-h.p. model, Simms-Bosch high tension magneto is used, while in the other types the magneto is of the low tension variety. The cylinder dimensions of the different sizes are: 16-20-h.p., 100 mm. bore by 120 mm.; 20-24-h.p. four-cylinder and 30-40-h.p. "six," 100 mm. by 140 mm.; 30-35-h.p. four-cylinder and 45-60-h.p. "six," 120 mm. by 160 mm.; and 40-50-h.p., 140 mm. by 160 mm. The lubrication of the cylinders is effected by means of a gear-driven pump, which supplies a drip feed rack on the dashboard. The oil tank is placed under the bonnet, as shown in Fig. 36, and serves to feed the pump which distributes the drip-feed. The mixture is furnished by a new patent carburettor, which automatically regulates the carburation in accordance with the engine speed, and at the same time greatly reduces the consumption of petrol. The engine is controlled by means of two levers placed above the steering wheel. The 16-20-h.p., which has been specially designed for town work, has a novel system of control; the clutch is so connected up with the throttle that when the former is withdrawn by pressing forward the pedal the speed of the engine is cut down; a further pressure on the pedal just before letting in the clutch accelerates the motor ready to take the drive; as regards the clutch, in the 16-20-h.p. and 20-24-h.p. models the leather-faced cone type is employed. The other cars are provided with a metal-to-metal clutch, formed by a segment fitted in a metal case connected to the flywheel by means of studs provided with flexible rings. The change-speed gear, which has "gate" control and gives a direct drive on the top speed, is the same as fitted to the 1906 cars. A feature of the live axle cars is that the cardan shaft is enclosed in a casing, which is supported independently, and practically acts on the torque rod, two radius rods being also fitted. Great attention has been given to the

suspension, and by the adoption of a system of three springs at the rear road shocks have been largely eliminated.

#### The "S.V.P." Car.

The exhibit of LA SOCIÉTÉ DES VOITURES POPULAIRES, of Paris, is interesting, comprising as it does one of the very few belt-driven vehicles in the show. The car, which is supplied as a two-seater, has a pressed steel frame, in the fore part of which is set, at right-angles to the usual position, an 8-h.p. single-cylinder vertical engine. A train of sliding gear-wheels adapted to give two speeds and a reverse is carried in an extension of the crank case, the shaft projecting through and carrying on its end a pulley. This is connected by two belts, fixed together at intervals by spring pieces, with a double pulley mounted on a countershaft at the rear. The latter is practically in two parts, each having connected to it at the inner end one-half of the double pulley, the other end terminating in a pinion, which meshes with an internally-toothed ring attached to each of the rear road wheels, the latter being supported on a fixed axle. By the use of the double pulley and the divided countershaft the necessity of a differential gear is claimed to be obviated, the belt slipping slightly on the corresponding part of the pulley on turning a corner. The employment of a clutch is also overcome by mounting the gear-box in such a way that it can be swung backwards slightly, so slackening the belt, which is entirely encased from end to end.

#### The Reyrol Cars.

Several examples of the little Reyrol or Passe Partout—as they are known in France—two and three-seated cars are shown by the SOCIÉTÉ DES AUTOMOBILES PASSE-PARTOUT, represented in England by the Motor Supply Company, Ltd. These vehicles, which are designed to meet the requirements of motorists of moderate means, are fitted with either a De Dion 6-h.p. or Buchet 6-8-h.p. engine; the mixture is furnished by an automatic carburettor, and the water circulation is on the thermo-siphon arrangement. A transverse spring has now been fitted at the rear of the chassis, in addition to the two semi-elliptic side springs. The gear-box provides three speeds and a reverse, and has a direct drive on the top gear, which is an innovation, as are also the torque-rod and the internal expanding brakes on the rear wheels. A new 10-12-h.p. four-cylinder Reyrol car (Fig. 37) is also on view. This has the four cylinders all in one casting, the bore being 75 mm. and the stroke 85 mm. The inlet valves are of the automatic type; the ignition is by high-tension magneto, and a feature of the carburettor is that the air inlet and the throttle are controlled by one lever.

Fig. 37.—The Reyrol 12-14-h.p. Four-Cylinder Car.

Different types of bodies can be fitted to the chassis, among those on view being a neat landaulet for town use.

#### The Berliet Cars.

The 1907 models of the Berliet cars are shown by the BERLIET COMPANY, of Lyons; as, however, they have already been seen in England, and described in our report of the Olympia Show, we need only mention that pride of place is given to the chassis of the new 60-h.p. six-cylinder vehicle. The cylinders, which are cast in pairs, are 120 mm. bore by 140 mm.

stroke, the valves being located on opposite sides. The lubrication is by means of a rotary pump driven off one of the half-time shafts, this forcing the oil up to the dashboard, where it is controlled by means of three easily adjusted sight feeds, two of which go to the motor and the third to the gear-box. The clutch, which is of an improved plate type, requires no exterior lubrication, the crankshaft being hollow, by means of which such little lubrication as is required is furnished by the engine. A feature of the gear-box is that it furnishes a direct drive on the third and fourth speeds, this being obtained by means of two bevels on the end of the gear shaft meshing with two crown wheels arranged one within the other on the differential shaft. Both the bevel pinions are free to run on the propeller shaft, one or other being engaged as required by means of a dog clutch.

#### The Louet Cars.

Messrs. LOUET AND BADIN, of Paris, are generally to be found at the *Salon* with something of mechanical interest. Prominent on the stand is a worm gear drive intended for commercial vehicles, the Louet pleasure cars being now fitted, however, with bevel gear transmission. The feature of the 24-h.p. four-cylinder chassis on view lies in the change-speed gear, the pinions of which are always in mesh, the requisite pair being made to transmit the power by means of dog clutches. The change-speed lever, which works in a notched quadrant, rotates by means of a segment and a bevel wheel a shaft on which are mounted a pair of grooved cams which operate the gear striking forks. Another point worthy of notice are the combined

Fig. 38.—The Radius Rods fitted on the Louet Cars.

torque and radius rods, which are cushioned in such a way that upon encountering an obstruction in the road the axle is capable of yielding slightly in a backward direction and afterwards recovering itself without injury to the mechanism. The arrangement is illustrated in Fig. 38. The chassis frame *a*, together with the springs *d*, shackles *e*, and the axle *c* are of the usual construction. Instead of a single torque rod, however, as is commonly employed in live axle machines, there are two parallel rods *f*, one on either side of the frame, which serve the same purpose. These rods are secured to the axle by means of three stud bolts which pass through suitable ears, and form a rigid connection. At the point *g*, the forward ends of the rods are articulated to sliding members *k*, which are adapted to ride in brackets as shown, the latter being permanently attached to the frame members. Between the joint *g* and the other end of the sliding members are interposed a pair of helical springs which press against the supporting lugs, thus tending to hold the rods in a normal mid-way position. When either or both the rear road wheels come in contact with an obstruction the result is that they are moved slightly backward, or are impelled forward in advance of the chassis in the event of dropping into a hollow in the road, immediately regaining their former position as soon as the unusual strain is removed. In this way the chassis, and particularly the axle and driving gear, are relieved of strains, and thereby protected from injury. A lock nut *l* at the forward extremity of the sliding members serves for purposes of adjustment. The cardan shaft is provided with a sliding joint to allow for the movement of the axle.

#### The Cottin-Desgouttes Cars.

The Rochet-Schneider, Miesusset and Berliet cars, which emanate from Lyons, are already well known. To the list has now been added Messrs. COTTIN AND DESGOUTTES, who are turning out cars—all fitted with four-cylinder engines—ranging from 18-22-h.p. to 70-h.p. The chassis we examined—a 24-40-h.p.—is a well-finished piece of work, the various details being on the

Fig. 39.—Front and Transverse Sectional Views of Cottin-Desgouttes Metal-to-Metal Clutch.

up-to-date lines of chain-driven vehicles. The cylinders—120 mm. bore by 140 mm. stroke—are cast in pairs and have the valves on opposite sides; ignition is by low-tension magneto, which, like the water circulation pump, can be quickly dismantled. The carburettor is of a special automatic design. The lubrication is maintained by a pump on the rear end of the inlet valve cam shaft. The clutch, two views of which are given in Fig. 39, is of the metal-to-metal expanding type, the operating mechanism being contained within the clutch shaft, which is made hollow for the purpose. The change-speed gear, which has "gate" control, is designed to give a direct drive both on the third and four speeds, this being obtained, as in the Pilain and Berliet cars, by two bevel pinions running loosely on the end of the gear-box shaft and meshing with separate concentric bevel crown wheels on the differential shaft, either of the small pinions being made to transmit the power by means of a dog clutch. The method of attaching the chain wheels on the cross shaft is worthy of notice, enabling, as it does, larger or smaller sprockets to be fitted as desired, by simply removing a special

Fig. 40.—Sectional View of Panhard Multiple Disc Clutch.

form of security nut. Double brakes are provided on the differential shaft, in addition to those on the rear road wheels.

#### The Panhard Cars.

Prominence is given on the stand of Messrs. PANHARD AND LEVASSOR COMPANY to the 18-h.p. and 24-h.p. cars. The first is a new model which has not yet been seen in England. The engine comprises four separate cylinders, the

crank shaft being supported on five bearings. The carburettor is regulated hydraulically by means of a branch pipe off the water circulation system. The latter is so arranged as to reduce the length of piping to a minimum; the water passes first through the fourth cylinder, and thence successively through the others, being discharged finally into the radiator. The ignition is by high-tension magneto, coil and accumulators being fitted as a reserve. The change-speed gear is adapted to give four speeds and a reverse, a direct drive on the top

Fig. 41.—Chassis of Gregoire 16-20-h.p. Car.

speed being now provided. The final drive is by side chains. In all the cars the armoured wood frame is still maintained, while those over 15-h.p. are fitted with a multiple disc clutch, which was first used on the 1904 Panhard racing car. A sectional view of the mechanism is given in Fig. 40, from which it will be seen that it comprises a central cage A, provided with a number of slots parallel with the axis, to receive the projections of the twenty metal driving discs. Between each one of the discs are placed an equal number of others of slightly different shape, and fixed this time on to a drum G, bolted on to the shaft G', thus transmitting the power to the change-speed gear-box. The clutch spring is lodged inside the forward end of the shaft G', which is hollow, and presses against the plates by means of a distance piece F. The clutch is lubricated from the engine, oil passing along a central hole in the crank shaft M, any excess finding its way out by small holes in the cage A.

#### The Gregoire Cars.

The GREGOIRE CO., whose British agents are Messrs. Osborn and Co., Ltd., are making three models for the 1907 season, 8-10-h.p. two-cylinder, and 12-16-h.p. and 16-20-h.p. four-cylinder, all having live axles and ball bearings to all parts, including the engine crank-shaft. In the 12-16-h.p. car the four cylinders are all in one casting and the inlet valves are of the automatic type. High tension magneto ignition is employed, and the change-speed gear gives three speeds forward as well as a reverse. The 16-20-h.p. vehicle (Fig. 41), is a new model. The motor has four cylinders, 90 mm. bore by 120 mm. stroke. The valves are all mechanically actuated off a single cam-shaft. The admission is on novel lines, the inlet pipes being cast in one with each pair of cylinders and joined together by a special connecting piece. The arrangement enables the cam-shaft side of the engine to be freed of complication. The ignition is by gear-driven magneto. The half-time gear wheels are located at the rear end of the engine, and are entirely enclosed; the crank shaft is carried on three bearings; the water circulation is on the thermo-syphon system, no pump being used; the radiator is of the vertical ribbed-tube type, set in a frame which forms the water tank; the arms of the fly-wheel are arranged to act as a fan. The lubrication of the engine is maintained by a valveless pump, located in the base chamber, and actuated by one of the inlet-valve cams. The clutch is of the leather cone variety, and the three-speed change gear is controlled by a single lever. Altogether the Gregoire cars appear to be of substantial construction, and have the merit of being moderate in price.

#### The Decauville Cars.

For the 1907 season the well-known DECAUVILLE cars, represented in England by Messrs. H. M. Hobson, Ltd., are being made in five sizes—12-16-h.p., 16-20-h.p., 24-28-h.p.,

30-35-h.p., and 45-60-h.p.; the first two have live axles, the 45-60-h.p. is driven by side chains, while the others are made with either cardan shaft or chain transmission. In the live axle machines the rear road wheels are not fitted on the axle but on a sleeve surrounding the same, the power being transmitted to them through "dogs" on the ends of the axle. Other features of the vehicles are the special form of automatic carburettor employed, and the fitting of high-tension magneto ignition as a standard. The leather-faced cone type of clutch is, we note, still being retained.

#### The Alcyon Light Cars.

LA SOCIÉTÉ ALCYON, of Neuilly-sur-Seine, exhibit a little 7-h.p. single-cylinder two-seated car. The vehicle is on the usual lines of cardan shaft cars, the gear-box giving three speeds and a reverse. The company is also now building a 10-12-h.p. four-cylinder two-seater at a moderate price. The dimensions of the engine are 75 mm. bore by 80 mm. stroke; the water circulation is on the thermo-syphon principle and the ignition by low tension magneto. The frame of the Alcyon vehicles is of the *chassis-carrosserie* type, in which the side members are extended upwards to form part of the body.

#### The Porthos Car.

A new car known as the "Porthos" is exhibited by the SOCIÉTÉ GÉNÉRALE DES AUTOMOBILES PORTHOS, of Billancourt (Seine). Generally speaking the vehicle follows the usual lines of chainless cars, although in the details some departures are made from the standard practice, particularly as regards the design of the live axle, in which provision is made for lateral movement. The engine, which is rated at 24-30-h.p., comprises four separate cylinders, 110 mm. bore by 120 mm. stroke, with the valves arranged on opposite sides. Two systems of high tension ignition—magneto and accumulators—are provided, and the mixture is furnished by an automatic carburettor. The clutch is of the leather-faced cone type, and the gear is adapted to give four forward speeds in addition to the reverse.

#### The Mutel Motors.

A range of the well-known Mutel motors is shown by Messrs. MUTEL AND CO., Paris. These are made in various powers extending from 10-18-h.p. to 40-50-h.p., with four-cylinders, to which has now been added a 50-60-h.p. six-cylinder model (Fig. 42). The cylinders are cast in pairs, and are 110 mm. bore by 130 mm. stroke; the valves are arranged on opposite sides; the contact maker is mounted on the engine, as

Fig. 42.—The Mutel Six-Cylinder Engine.

are also the water and lubricating oil pumps, while a platform is provided on which a magneto can be fitted.

#### The Hurtu Cars.

LA COMPAGNIE DES AUTOMOBILES HURTU have a large stand, on which are shown specimens of the 8-h.p. single-cylinder and 10-h.p. double-cylinder, and 12-14-h.p., 18-20-h.p. and 20-25-h.p. four-cylinder vehicles which are being turned out for the 1907 season. The vehicles have pressed steel frames narrowed at the front to increase the lock of the steering wheels; except in the 12-14-h.p. vehicle, the engines have

separate cylinders. Either three or four speeds forward and a reverse, with direct drive on top speed, are provided. The gear-box is provided with ball-bearings, and transmission is by enclosed cardan shaft to a live rear axle. Special attention may be drawn to the new 12-14-h.p. model, which in view of its relatively low price and general finish is well worthy of close inspection; indeed, it is generally admitted that for motorists of moderate means the vehicle is one of the best to be found in the show.

#### The Brouhot Cars.

In addition to half-a-dozen sizes of chain-driven vehicles, ranging from 12-h.p. to 60-h.p., Messrs. BROUHOT AND CO. of

Fig. 43.—Elevation and Plan of the Brouhot 10-h.p. Live Axle Car.

Vierzon (Cher), have introduced two new models—8-h.p. two-cylinder and 10-h.p. four-cylinder—with live axles. An elevation and plan of the latter are given in Fig. 43. The cylinders are cast in pairs, and have the valves arranged on opposite sides. The water circulation is by thermo-syphon, and we note that the fan, which draws a current of air through the ribbed-tube radiator, is mounted on a ball bearing. Passing to the 24-30-h.p. chain-driven car, a feature of the engine is the variable lift device on the inlet valves obtained by means of tapered wedge pieces which can be inserted between the valve push rods and stems, the arrangement being controlled by a lever on the steering wheel. The crank chamber is divided into compartments, so that each cylinder is efficiently lubricated. The carburettor, which is provided with a hot-water jacket, is of the automatic type, while the ignition is by low tension magneto. The lubrication of the motor is controlled by a pump, which forces the oil from the tank through a sight-feed lubricator on the dashboard. The control is by two sectors on the steering wheel, one actuating the ignition and the other the quantity of mixture allowed to pass to the cylinders. Other features of the vehicle include the clutch, which is of the expanding type with leather to metal surfaces, the fitting of double brakes on the differential shaft, and the neat and handy form of adjusting the tension of the driving chains. Ball bearings are used throughout, with the exception of the engine. On the stand is also to be seen a 24-30-h.p., fitted with a special limousine body, built for the King of Portugal.

#### The Tourand Cars.

Messrs. A. TOURAND AND CO., of Suresnes, exhibit an 18-24-h.p. the frame of which is on special lines, it being a combination of the pressed steel and tubular types; at the bottom it is of channel section, but the top is bent over and rounded, then finally turned down and riveted to the side, the whole

giving the appearance of an angle section surmounted by a tube. Long stiffeners set at an angle to the frame sides are provided, the whole forming, it is claimed, a lighter and stronger construction than the ordinary type. As for the motor and transmission, these are on the standard lines of live axle vehicles; the engine comprises four-cylinders 100 mm. bore by 120 mm. stroke; the clutch is of the multiple disc type and the four forward speeds are controlled by a "gate" lever.

#### The Gillet-Forest Cars.

The GILLET-FOREST COMPANY exhibit a range of cars fitted with vertical motors, including 12-h.p., 14-16-h.p., 25-32-h.p. and 35-50-h.p., all provided with four-cylinder engines. The main features of the larger cars are pressed steel frames, dual ignition, "gate" change-speed gear, and a spring drive on the rear end of the cardan shaft, the transmission being by bevel gear to a live axle. A noteworthy feature of the cardan shaft is that, instead of it running direct from the gear-box to the bevel wheel on the back axle, it is carried in a steadying bearing, located a short distance behind the gear-box. The 12-h.p. and 14-16-h.p. are new models which, in view of their relatively low price, should attract considerable notice. The engine differs from that employed on the 25-32-h.p. and 35-50-h.p. cars in that the valves are all operated off a single cam shaft. The change-speed gear, too, is located at the rear end of the cardan shaft instead of near the clutch.

#### The Rebour Cars.

A car which deserves to be better known in England is the Rebour, made by M. E. H. MICHEL, of Puteaux. The one on view is of 30-h.p., and follows closely on Mercedes lines. The motor has its four cylinders cast in pairs, with the valves placed on either side. The bore is 110 mm. and the stroke 130 mm. The carburettor has a single jet with automatic air control, which enables an engine speed rate varying from 150 to 1,400 revolutions per minute. The clutch is of the multiple disc variety, and the "gate" type of change-speed gear is employed, the final drive being by side chains. Attention may be drawn to the provision on the countershaft of a jaw-clutch, by which the differential can be locked solid, thus enabling the car to be driven home on one wheel should one of the driving chains break.

#### The Weyher-Richemond Steam Car.

One of the few steam cars in the Show is to be found on the stand of Messrs. WEYHER AND RICHEMOND, of Pantin (Seine)

Fig. 44.—Elevation and Plan of Weyher-Richemond Steam Car.

who have on view a chassis of the 25-32-h.p. vehicle (Fig. 44), to which they are at present devoting attention. Outwardly the car closely resembles a petrol vehicle, the generator, which is of the flash type, being located under a bonnet in the fore part of the frame. Paraffin is used as fuel in a special design of burner.

The engine is of the horizontal type, having four cylinders set in pairs on each side of the crankshaft which drives the differential through gearing, the power being thence conveyed to the rear road wheels by side chains. The water supply to the generator is maintained by a feed pump, which in turn is controlled by a lever on the steering-wheel. All the mechanism behind the dashboard is below the level of the frame, so permitting any type of carriage body to be fitted.

Fig. 45.—The Aries 30-35-h.p. Berline.

#### The Aries Cars.

LA SOCIÉTÉ DES AUTOMOBILES ARIES, of Villeneuve-la-Garenne (Seine), are making no less than seven sizes of cars ranging from 12-14-h.p. to 50-h.p. While following standard practice, they appear to be of high-grade construction, and have certain features of their own. The chassis we examined was of the 30-35-h.p. type. The engine comprises four separate cylinders, with mechanically-operated inlet valves and automatic carburettor, the extra air inlet being controlled hydraulically by a branch off the water circulation system. The clutch is of the metal-to-metal disc type and the transmission is by cardan shaft and bevel gear on to a live axle. The latter is of special design, a fixed axle being provided below it to support the differential case and render it rigid. The shafts from each side of the differential run through the hollow ends of the dropped fixed axle, on which the road wheels are mounted on balls, the drive to the wheels being through a star dog clutch on the end of the live shafts. The differential shaft has thus only to transmit the power without carrying any of the weight of the car.

#### The Delaugere-Clayette Cars.

Messrs. DELAUGERE AND CLAYETTE, of Orleans, exhibit an interesting range of cars, which have not yet been seen in England. They are made in sizes extending from 8-10-h.p. double-cylinder to 60-80-h.p. four-cylinder. The 24-h.p. car is a chain-driven vehicle with leather cone clutch, "gate" change-speed gear and three-quarter elliptic rear springs. A point worthy of notice is that the dashboard is devoid of the usual range of lubricator and other fittings, the only things on it being oil and water circulation gauges set in a neat frame.

#### The Roy Car.

M. P. ROY, of Grand Montrouge (Seine), exhibits a 14-20-h.p. four-cylinder car, the feature of which lies in the special cardan shaft drive and the unusually wide rear brakes. The engine, in which the valves are all operated off a single cam shaft, is supported on tubular bars extending across the frame. In addition to the usual universal joints on the cardan shaft, at the rear end of the latter is a spiral spring, which prevents a bad road from causing too sudden shocks to the shaft. The

live axle has only the driving power to transmit, the weight of the car being taken by the sleeve surrounding it.

#### The Miesusset Cars.

Still another firm hailing from Lyons is LES ÉTABLISSEMENTS MIEUSSET, who are making a wide range of cars extending from a double-cylinder 7-9-h.p. to a 30-40-h.p. four-cylinder. The chassis we examined was that of the 20-24-h.p. four-cylinder type, and so far as we could see it is an excellent production on the customary lines of chain-driven vehicles. The cylinders, which are cast in pairs, are 105 mm. bore by 130 mm. stroke, the valves being arranged on opposite sides. Dual ignition is provided, while the throttle on the automatic carburettor is controlled by both foot and hand levers. The clutch is of the leather-faced cone type, and the change-speed gear, giving four speeds forward and a reverse, is operated by a lever working in a "gate." We may add that Mr. W. H. M. Burgess is the British agent for the Miesusset cars.

#### The Henriod Cars.

M. HENRIOD, of Neuilly-sur-Seine, who many years ago devoted considerable attention to air-cooled engines, is still experimenting with this type, and exhibits a 32-h.p. motor, the four cylinders of which are provided with large radiating ribs. Mounted at the side of and between each pair of cylinders are two large fans driven off the crank shaft to assist in the cooling. At this stand is also to be seen a 30-h.p. four-cylinder car, in which the change-speed gear is located at the end of the cardan shaft, and combined with the bevel gear drive to the rear live axle.

#### The Metallurgique Cars.

Among the prominent Belgian exhibitors at the Salon is LA SOCIÉTÉ METALLURGIQUE, who display a range of the well-known cars bearing their name. The models on view include a 24-28-h.p. chassis, a 30-35-h.p. limousine, and a 60-80-h.p. chassis—all having four-cylinder engines. We give a view of the 60-80-h.p. motor in Fig. 46, and may remark that the crankshaft is *desaxe*, and that the inlet valves are arranged in the cylinder heads, they being mechanically operated by push rods from a single cam shaft. Two high-tension ignitions are provided. The carburettor is of the automatic variety, the

Fig. 46.—The Metallurgique 60-80-h.p. Motor.

extra inlet valve being provided with a glycerine dashpot in place of the usual spring control. The clutch is of the expanding metal-to-metal type, and an interesting device consists of a locking bolt which, by pressing an extra foot lever, locks the two parts of the clutch together, thus preventing any slip when climbing hills. The gear-box is adapted to give four forward speeds, the final transmission being by a cardan shaft, spring drive, and bevel gear to a live axle.

(To be continued.)

THE Earl of Caledon, against whom two previous convictions were proved at Horsham last week, has had his licence suspended for three months.

THE Chancellor of the Exchequer has expressed the view that the industrial methylated spirit defined by section 4 of the Revenue Act, 1906, could not be allowed to be used for automobiles.

New members of the A.C.G.B.I. include the Duke of Hamilton, Lord Ronald Gower, the Hon. Lionel Holland, Sir W. J. Farrer, and Mr. A. E. W. Mason, M.P.

MESSRS. GEORGE AND JOBLING have adapted their garage in Blackwellgate, Darlington, to the purposes of reception rooms for motorists, as well as accommodation for cars.

FROM Messrs. C. Toope and Son, of Stepney Square, Stepney, E., we have received a copy of their catalogue of heating stoves, which are adapted to work either with gas, oil or coke, and are well suited for the heating of motor-houses.

A SERIES of pictures of the various automobile sports of 1906 in which Michelin tyres have attained distinction has been sent us by the Michelin Tyre Company, and forms an interesting souvenir of the year from the motor sportsman's point of view.

THE Daimler Motor Company, Ltd., have given a 28-h.p. car complete with accessories, &c., to the Coventry and Warwickshire Hospital, which will be disposed of for the benefit of that institution, to the funds of which Messrs. Humber, Ltd., have given £250.

WE learn that Mr. G. J. Nearing, who took an active part in the organisation of the recent Blackpool race meeting, has joined the firm of Messrs. Huntley Walker and Co. and will take charge of the firm's repair shop, trial and testing departments, &c., at 483, Oxford Street, W.

THE business of the Peterborough Motor Garage Co. has been acquired by the Peterborough City Garage Co., who will entirely re-organise the concern, extend the premises and generally add to the repair facilities in the city. Mr. A. W. Elliot is a member of the company, and he will supervise the repair department and see that the stock of replacements is fully representative of modern motor requirements.

FROM the Comitato Incremento, Feste e Riunioni Sportive, of Palermo, Italy, we have received a copy of an artistically got-up descriptive souvenir of the 1906 Targa-Florio race. The work, to which the name "Rapiditas" has been given, comprises an interesting account of the contest in four languages, Italian, English, French, and German, and a series of full page illustrations of the competitors and their cars, and interesting snapshots taken during the race.

MOTOR-CARS may now be weighed at the City of London Weights and Measures Office, 18, Whitecross Street, E.C. There is a public weighbridge with a capacity of 15 tons 19 cwt. 3 qr. 21 lbs., and here motor-cars and 'buses not exceeding one ton in weight can be weighed for a fee of sixpence, an additional twopence being charged for every additional ton or fraction of a ton. An official receipt is given, on which the weight is stamped and the Corporation have done well in thus attempting to be of convenience to motorists.

WHILE many manufacturers have been loudly complaining of the stringency of the Scotland Yard authorities in using their powers in applying the motor-omnibus regulations, Messrs. Scott, Stirling and Co., Ltd., of Twickenham, have gone steadily on their way, licences for their 'buses being issued without delay—a fact which says much for Scott-Stirling productions. In addition to their standard 24–30-h.p. double-deck vehicle, we learn that the company are putting on the market for 1907 a 28–35-h.p. chassis for routes with heavy gradients and for country work. The new model will retain all the distinctive features of the 1906 type, but amplified in several respects to meet the heavier working conditions to which it will be submitted. Attention is also being devoted to the construction of two and three-ton delivery vans.

## HERE AND THERE.

FOR slashing William Adcock, chauffeur, across the face, the Rev. A. Langdale Smith, of Holton, was recently fined 10s. and 8s. costs at Oxford.

THE WOLSELEY COMPANY has sent us a photograph giving a striking view of a train load of Siddeley chassis being sent from Crayford to Adderley Park, Birmingham, where the company's extensive body works are situated.

MR. JOHN BURNS has deputed a Local Government Board official to attend the trial of non-skidding devices for motor-buses, and has promised personal consideration of his report.

MRS. C. N. WILLIAMSON must look to her laurels, for Mrs. J. M. Barrie has begun to write motoring sketches, the first appearing in the "Woman at Home," and describing a charming tour in Normandy.

At the rear of the Burlington Hotel, Eastbourne, Messrs. F. Ray and Sons, who have acquired the business of Messrs. Jury and Sons, intend to establish a motor garage with accommodation for fifty cars.

MR. COLIN DEFRIES having ceased to be manager of the Waterloo Motor Works, the Hon. L. Bruce intends to give his personal attention to the management, with which Mr. L. J. Bull will be associated.

A 35-40-h.p. Iris Car with Limousine Body.

The vehicle has accommodation for three persons on the back seat, two in front and two on folding seats inside. The interior of the car is trimmed in light grey French cloth finished with silk laces, the front seat being upholstered in morocco-finished hide. The painting is in dark olive-green throughout with black mouldings and fine green lines.

HOLDERS of licences for the storage of petrol should remember that such cannot be transferred without the sanction of the local authorities. Lack of knowledge on this point has just led a Dumfries firm to the court, where they were fined £2 and costs.

THE men attached to the L.C.C. fire station in Eltham Road, Lee, left with their appliances in fifteen seconds from the moment of receiving a call the other day. This is the first fire brigade station in London to be equipped with motor appliances to the exclusion of horses.

ACCORDING to the returns issued by the American Association of Licensed Automobile Manufacturers, 1,204 foreign motor-cars, valued at £88,000, were imported into the United States during the ten months ending October last, as against only 912 vehicles (£63,000) in the corresponding period of 1905.

THE Electric Vehicle Company, of Hartford, Conn., U.S.A., is reported to be bringing out a new petrol-electric car. The dynamo takes the place of the flywheel on the rear end of the crankshaft of a four-cylinder engine. At the back of the dynamo is an electric motor, whose shaft is coupled to the ordinary cardan shaft by which the rear axle is driven. Five forward and three reverse speeds are provided. On all except the highest speed the variations are effected electrically. On the top speed, however, the drive is direct from the engine to the cardan shaft, the dynamo and motor rotating merely as flywheels.

A TWO-TON Mann motor-wagon is now being used to carry colliers from Doncaster to a pit several miles from the town.

AMONGST recent purchasers of Daimler cars are Lord Hylton, the Duke of Buccleuch and Sir Henry York, K.C.B.

THE Petherton Motor Works and Garage has accommodation for more than thirty cars at 116, Petherton Road, London, N.

THE "Duco" motor mirror is another addition to the motor accessories emanating from the house of Messrs. Brown Bros., Ltd. This mirror is specially intended for fixing on the

dashboard of the car, or on any other convenient place in front of the driver, so that he is able to discern what is immediately behind. The adoption of this device should tend towards decreasing the number of minor mishaps and frequent damage to the car which happen in crowded thoroughfares. The mirror can be regulated to any desired position, and constitutes a smart addition to the automobile.

THE Continental Tyre and Rubber Company, Ltd., have just received, through the Daimler Company, a repeat order for H.R.H. the Prince of Wales for their red rubber steel armoured non-skid tyres, recently mentioned in our columns.

THE British Empire Motor Trades Alliance has received an enquiry from a Spanish port for a 30-h.p. motor-omnibus to carry sixteen passengers and a 30-h.p. motor-vehicle for goods. British manufacturers of the above are requested to

communicate with Mr. J. B. King, secretary, 11, Red Lion Square, London, W.C.

MESSRS. E. V. COOKE AND Co., textile machinists and general engineers, have opened a garage at their Winton Ironworks, Bridgewater Street, Patricroft, Manchester, for the storing, repairing, and overhauling of every make of motor-car.

MESSRS. J. I. THORNYCROFT AND Co., LTD., ask us to contradict the report that they are giving up their Basingstoke works. So far from this being the case they have standardised the cars made at Basingstoke for the coming season, and their sales are showing a good increase.

MR. DOUGLAS S. COX is now arranging for free storage of the cars of his customers, and for the larger type of vehicles he is providing separate lock-up compartments at his garage at Thomas Place, West Norwood, S.E.—a fact which should be of interest to prospective motorists in that district.

MR. A. H. HUNT, who is the sole British agent for the "Hellenes" dry cell ignition battery, has issued a price list of his accessories for motor-cars, &c., including the "G. L." non-trembler coils, contact breakers, voltmeters, plugs, &c. A series of useful tool wallets is also included in the list.

CHADWICK'S HANDBOOK OF MOTOR OWNERS promises to become a list of Society people. It is headed with thirteen British Royal motorists, and contains about 15,000 addresses of motor-car owners, as well as lists of hotels that have special accommodation for motorists. Apart from a few omissions of really prominent firms in the category of motor-car makers, the directory seems to have been carefully compiled, and should serve a useful purpose.

MESSRS. JAMES NEALE AND SONS, LTD., of 68, Graham Street, Birmingham, are well-known makers of motor-car lamps as well as of carriage furniture and ironmongery. Among their specialities lately introduced is a new wind screen joint known as the Raydyot. This is extremely simple in action as well as efficient, there being no springs or screws to get out of action. In order to alter the position of the screen when in position, it is only necessary to raise a small lever on each joint—an action that can be performed without leaving the car. This is certainly an effective joint which should give security as well as ease of operation.

MR. J. J. KEATING is extending his garage and motor workshop in Lower Abbey Street, Dublin.

ANDERSON'S Bristol Rubber Company have acquired the business of Abbott, Anderson and Abbott, in Queen Street, E.C., and also that of Messrs. Malcom and Co., of Green Street, W.C., both of which they will continue at the same addresses. Their new list contains a varied selection of waterproof garments for motorists.

THIRTY-SIX inch road wheels will, it is stated, be the standard for American high powered cars for next year, the advantage being that greater road clearance is given, that the danger of having highway obstructions interfere with the mechanical parts of the car is minimised, and that the wear on the tyres is reduced.

MR. HARRY JULIAN, of Reading, is opening a new garage at 140, Friar Street, Reading, in the first week of the new year. The garage will be thoroughly equipped, and motorists travelling through Reading should make note of the address, since, although the showroom is devoted entirely to Humber cars, every appliance will be at hand for repairs to other cars, and general assistance to motorists.

MOTOR-CARS are now being largely used by professionals to enable them not only to get rapidly from place to place in the metropolis, but also to journey from town to town. Among them is Mr. T. E. Dunville, who has had a Peugeot car for about a year. He has twice toured the provinces, Scotland, Ireland, and Wales, and writes that it has landed him safely and with time to spare on every occasion.

THE motor race meeting organised by the Automobile Club of the Argentine Republic on the 10th inst. proved a decided success. Three events were run off on a 36 kilometre course, from Buenos Ayres to Tigre and return, the principal one being for the El Pais Cup, for four-cylinder touring cars, which was won by Marin, on a 40-h.p. Darracq, in 28 min. 36 sec.; Rade, on a 24-h.p. De Dietrich, being only 9 sec. behind.

FROM Wolverhampton comes the new catalogue of the Star Cycle Co., Ltd., referring to the Starling and Stuart cars recently described in our report of the Stanley Show. In the latter vehicles they have endeavoured to meet the public demand for a car to carry four people at a very reasonable price, and a perusal of the new list, in which coloured printing is employed to good effect, should assist those of our readers who are not yet motorists in coming to a decision.

THE usual method of filling the petrol tank of a car is exceedingly awkward, and the greatest difficulty is experienced in preventing the spirit from splashing over the funnel. There

is, however, no longer any need to follow the procedure adopted in the case of an antiquated oil lamp. Messrs. Alfred Dunhill, Ltd., have introduced a little device known as the Automatic Petrol Syphon, which enables the petrol tank to be replenished with facility and speed, and eliminates any risk of the spirit being wasted and splashed about. The simplicity of the apparatus will be seen from the accompanying

illustration. The end of the rubber tube is placed in the tin of petrol, and the tap is inserted in the petrol tank of the car. A few rapid compressions are given to the bulb behind the tap and the spirit then flows in a continuous stream. For ascertaining the quantity of liquid inserted the flow can be temporarily stopped by closing the little valve on the tap. The bulb need only be used for starting the flow; it is not necessary to operate it all the time.

## CONTINENTAL NOTES.

### The Touring Car Race for the Kaiser's Prize.

It has been decided that the touring car race in the Taunus for the Kaiser's prize shall be run off on June 14th next. The course over which the contest is to be held, and which will have to be covered five times, measures  $77\frac{1}{2}$  kilometres, or only about half that on which the 1904 Gordon Bennett race was held. The starting point is near Saalburg, where the cars will travel via Wehrheim, Usingen, Gravenwiesbach, through the Valley of the Weil to Immershausen and Schmitten, where the climb up the Feldberg commences; this being followed by a steep down hill run to Oberursel and back to Saalburg.

### The Monaco Motor Boat Meeting.

The International Sporting Club has just published its programme for the exhibition to be held at Monaco in 1907, which precedes the competitions arranged from April 2nd to 14th, 1907. The rules and regulations are similar to those of last season. An exception has, however, been made for the seventh and last day, when a trial event will be sailed according to the new measurements elaborated in November last. The committee has voted a sum of £4,200 as prizes for the success-

it passed over the Grand Palais, where the *Salon* is being held, the running of the engine could be distinctly heard. The airship afterwards passed over the Esplanade des Invalides towards the Pantheon, and then returned along the Seine to Meudon, the performance throughout being a notable one.

### Fuel Consumption.

M. de Siqueira, a member of the Association Generale Automobile, has offered this body a sum of £40 as a prize in a competition of apparatus designed to correctly measure the fuel consumption in the petrol engines of motor-cars. It has been decided to ask the Technical Committee of the A.C.F. to draw up the necessary rules and regulations.

### The Congress of National Automobile Clubs.

An important meeting of representatives of the principal automobile clubs of the world was held in Paris on Saturday last, when the main business dealt with was that of the boycott of Switzerland by motorists. After some discussion a resolution was adopted to the effect that, "in view of the explanation of the Swiss Automobile Club, this Association decides to temporarily suspend the boycott of Switzerland for a period of one year, and to send any complaints made by motorists with regard to treat-

The Crown Prince and Princess of Germany on their 70-h.p. Mercedes at Bad Kreuth.

ful competitors, in addition to works of art, &c. Only the craft exhibited will be qualified to compete in the races. Engagements, accompanied by the entrance fee of £4, must reach the International Sporting Club of Monaco on or before February 28th next. A photograph or sketch in blue will suffice, with the name of the builder of the hull and the name of the maker of the motor, the names of the owner or owners, that of the captain or master, and that of the boat, with her length from end to end, width of beam, height of freeboard, and number of passengers fixed by regulation. For next year the two categories of racers and cruisers have been increased by events organised for service cutters pertaining to the Navy, and hydroplanes.

### Navigable Balloons.

Much interest was shown in Paris on Monday in the performance of the military navigable balloon, "La Patrie," which traversed the greater part of the city from the Porte Maillot to the Pantheon, and along the river Seine. The balloon left Chalais about three o'clock, and sailed over the Bois de Boulogne, with three military officers and two engineers as passengers. The balloon, which answered freely to every change of the helm, kept about 650 ft. above the ground, and as

ment in that country to the Swiss Club." It was also resolved to hold another meeting at Homburg on June 15th next year, when the question of the unification of racing rules is to be discussed.

### Motor-Cars for Military Purposes.

M. Trouin, an Algerian deputy, has given notice that he will ask the French Minister of War, when the next Budget is presented, what measures he proposes to take to prepare for the requisition and mobilisation in time of war of all motor-vehicles in private hands.

### Miscellaneous Items.

Fourteen entries have been received for the trial of engine-starting appliances which the A.C.F. is holding in connection with the Paris *Salon*.—A thirty-four-mile circuit close to Fontainebleau, and only forty miles from Paris, has been proposed for the 1907 A.C.F. Grand Prix race.—Signor Marconi is making some experiments with an automobile radiotelegraphic station in connection with his system of wireless telegraphy.—Hemery the well-known racer, is reported to have left the Darracq Company, and to have joined the firm of Messrs. Tourand and Co., of Suresnes.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### POLICE AND MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In connection with the inaugural dinner of the Lincolnshire Motor Cycle Club, we had a letter from Capt. C. Mitchell Innes, Chief Constable of this large county, and which will be much appreciated by the many automobilists throughout Lincolnshire.

In regretting his inability to be present at the dinner and so showing his "sympathy with the inauguration of clubs in connection with motoring," Capt. Innes said "The police of the county have received most valuable assistance from the Lincolnshire Automobile Club towards the prevention of 'regrettable incidents' in connection with motoring, thanks to their consistent discouragement and condemnation of inconsiderate driving of any kind amongst their members—a policy which has had very practical and happy results for all concerned." I hope the police may look forward with every confidence to the consistent support of the Lincolnshire Motor Cycle Club in maintaining and consolidating the, on the whole, very happy condition of "things automobile" at present existing in our county. The club can do so much if it will.—Yours truly,

G. J. WILKINSON.

Three Methods of Locomotion.

### THE QUESTION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying again to "W. J. W., A 1299," on the question of speed, may I say that this gentleman is mistaken in supposing that after one has passed the necessary examination for driving in France they are allowed to go at what speed they like. There is a speed limit there as here, but, so long as a man drives carefully and considerately, the rate of speed is not worried so much about. The arrangement of handing a certificate to the police is no greater trouble than filling in the forms as is done in England; and when one buys or sells a second-hand car one obtains with the car, or gives with it, as the case may be, the certificate relating to such car. As to the part of your correspondent's letter relating to "momentary fits of forgetfulness," this is foolish, as a man who is liable to "fits of forgetfulness," whether "momentary" or of longer duration, is certainly not the man to drive a car, whether speedy or otherwise. Referring to the latter portion of this gentleman's letter, where he says he will do all he can to put down the scorching motorist, this is all very well so far as it goes; but, if he can, let him discriminate between the scorching motorist and the speedy motorist before he begins to wield his power against the unlucky ones who happen to be running slightly above the "legal limit." As to his suggesting that people who spend from, say, £800 to £1,500 in a speedy car could find a better use for their money, let me respectfully remind your correspondent that surely one is at liberty to spend their own money as they like. Will the public ever realise that exceeding the legal limit does not, *ipso facto*, constitute reckless driving? If the public does not realise this, at least the motoring section ought to.—Yours truly,

ALAN A. L. HICKMAN.

### BRITISH AND FOREIGN AUTOMOBILE INDUSTRIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When I read Mr. E. Manville's letter in the last issue of the *M.C.J.*, I thought of the old saying that "figures may be made to prove anything." As one who closely follows the monthly returns issued by the Board of Trade, I was able to see at once that Mr. Manville had only taken those figures which go to prove his argument. It is quite true that the imports of motor-cars, during the ten months ending with October last, did not show a proportionate increase, the advance over the same period of 1905 being roundly only £30,000 as against the £287,000 increase of 1905 over 1904. Your correspondent, however, fails to take any cognisance of the importation of "parts," in which I believe I am correct in stating chassis are included. The respective values of these imports are:—

For the ten months ending	£	Increase over preceding year.
October, 1904	294,013	—
October, 1905	717,346	423,333
October, 1906	1,598,686	881,340

I would also like to draw Mr. Manville's attention to the fact that in the returns the combined total of imports of cars and parts is given, these being as shown below.

#### Imports of motor-cars and parts.

Date.	£	Increase over preceding year.
First 10 months, 1904	2,176,978	—
First 10 months, 1905	2,887,178	710,200
First 10 months, 1906	3,797,885	910,707

Thus, far from the imports, at present, showing any tendency to decrease, they are still on the upward grade, and in view of this I think that Mr. Manville is somewhat bold in his prediction as to what the position will be a year hence. I am making a note of his prophecy in my new diary, so that I may not forget to see whether it comes true or not.—Yours truly,

C. JAMES.

### FOUR v. SIX CYLINDER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is seldom that Mr. Edge declines to argue as to the merit of any particular article which he may at the moment be selling, but I do feel that he is in very great difficulty in trying to explain away the success of the four-cylinder cars over the six-cylinder in the recent Town Carriage Competition of the Automobile Club. It must be remembered that that competition was the very first held in which the comparative merits of the two types of vehicle could be carefully judged, and it would have been impossible for a more complete contradiction to have been made of the exaggerated claims made by Mr. Edge during the last two years as to the superiority of the six-cylinder over the four cylinder system. I myself thought that he might perhaps have some reasonable explanation for the failure of the six-cylinder car to score over its four cylinder rivals, but, whilst I sympathise with him, I regret that he should have evaded the whole matter.

Mr. Edge has taken up the point that the four-cylinder car is more destructive on tyres than the six-cylinder, and suggests that my attitude cannot be understood unless I am interested in a tyre factory. During the recent show I was voluntarily informed by two users of six-cylinder cars—the names of which I need not state—that in one case the tyre bill had amounted to over £350 in twelve months, and, in the other, nine months' running had resulted in a total expenditure of over £400 for tyres alone. I am wondering if any four-cylinder car could beat this record.

It is very difficult to argue with an opponent who misquotes what has been said before, but I would like to challenge Mr. Edge to produce any letter of mine or any statement of mine in which I ever suggested that it was impossible for good motor-cars to be manufactured in Great Britain. What I did say was that the motor-cars manufactured in this country two years ago—the time I wrote my letter—were not as good as many of their foreign rivals. I have never posed as a prophet, as to do this it is necessary to possess an imagination, and in this direction I am always prepared to receive ideas from Mr. Edge. Six cylinders possess certain advantages over four, but there are certain disadvantages, and these disadvantages were very clearly demonstrated in the Town Carriage Competition previously referred to by me.—Yours truly,

CHAS. JARROTT.

### SKIDDING EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall never forget my feelings of astonishment when my first car, a small high runabout with smooth tyres, turned round suddenly and faced the opposite way. We were driving on wet wood blocks on the level. The car repeated the performance, describing a huge figure eight from kerb to kerb, on the same road, on another occasion during rain. There was no damage done, although the wheels (wire) struck with a shock against the kerbstone. My next bad skid was on ice. I was driving a powerful 36-h.p. petrol car, on a frost-bound road. All four wheels were fitted with non skid bands. A farmer's cart obliged me to run off

the crown of the road, where there was snow, the rest of the road being rough ice. As soon as two wheels touched the snow the direction of the car was changed. The front wheel ploughed up the bank and struck a glancing blow at the wall. The back wheel at the same time struck the bank, and the shock was somewhat distributed, the result being two bent axles, straightened at a cost of £8, and a damaged front tyre. My last skid was the most serious. I was driving a large car weighing some 25 cwt. down a hill on granite. The driving wheels were fitted with non-skid bands of another make. A tramcar was sighted some eighty yards below on a single line, and I moved to the left. The car skidded, I got her straight; she skidded again and the tram driver pulled up, but my car swung completely round and the left-hand hind wheel swung into the front of the tramcar with sufficient force to project my only passenger on the back seat out of the car into the front portion of the tramcar, where he cut his head. The tool box on the step was smashed to atoms, the car body was seriously damaged, tension rod, &c., broken, and the tramcar was sufficiently punished to require assistance in surmounting the hill. As there was a cemetery handy I left the car in a shed and got my passenger to the doctor in a cab. He was sitting at the time of the collision with his hands in his pockets. The granite was so greasy that it was difficult to stand on it with my golfing boots

have paraffin with us, and I think that it is in this direction that inventors should concentrate their energies. I am afraid that it will be next to impossible to get a carburettor to "start from cold" with paraffin, as it will be absolutely necessary to apply heat either internally or externally to get a starting mixture. It would not be much of a hardship to burn a little methylated spirits, however, to heat a coil, as Mr. Bennett proposes, and I think he is working in the right direction in heating his oil before it goes to the carburettor spray. Why, however, does he use cold air instead of warmed air to mix with his spray? I have a carburettor working on an ordinary gas engine, with Scotch shale oil (Broxburn), which is one of the most difficult paraffin oils to vapourize; the oil passes through a coil of  $\frac{1}{2}$  in. copper pipe kept hot by contact with the exhaust. The air to the carburettor then passes through an exhaust-heated passage, where it gets heated before coming in contact with the already warmed oil. The mixture is then conducted through another passage, also exhaust-heated, before entering the gas valve. The main air supply is by a separate air valve, and the engine is governed by "hit and miss" on the gas valve. Petrol is used to start up, and a fair good heat must be attained before the oil is turned on, but with Royal Daylight the exhaust is quite hot enough in five or ten minutes to switch on the oil. The

Military Motor-Cars in Austria.—The Armoured Car with Quick-Firing Guns and a Motor Side-Car, the latter being used in connection with the rapid erection of telegraph and telephone lines. [Allgemeine Automobil-Zeitung.]

on. Luckily I am insured, but it is evident that to prevent skidding non-skids should have projecting rivets and not smooth steel bands. On ice these smooth steel protectors are a source of danger. I have had my car stopped on a hill with the driving wheel spinning round all the time, polishing the ice still smoother. On greasy granite and wet tram rails they are as dangerous as smooth tyres. I have been motoring for four years and am hoping to do without horses eventually, but, living 950 ft. above sea level, in a very hilly district, I have not yet found a non-skid that I can depend on for winter work. If one could screw studs, blunt or sharp, to suit the weather conditions, into a strong non-skid band as one does into horses' shoes, the motor-car might be depended upon. Can any reader make a suggestion that will enable me to get rid of three hungry harness horses and use to the fullest extent two powerful cars?—Yours truly,

C. D. L.

#### PARAFFIN AS FUEL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have been hearing a lot of late about alcohol versus petrol, and it is refreshing to see that the paraffin question is being taken up. It may be long enough before we get alcohol, but we already

only drawback is in having to use petrol at all, but in the absence of this lamp warming or some other means of heat would have to be resorted to.

There are some factors that must not be lost sight of in designing a carburettor for paraffin. There is a wide variance between the different flash points of various oils, and a carburettor which would work with one might not do with another, and to be a commercial success we would need to be in a position to use any kind of paraffin that could be procured locally. Taking American Royal Daylight with a flash point of 75 degrees as about the lowest, and the Scotch oils with a flash point of 115 degrees to 140 degrees as the highest, there is a wide variation in the temperature which would be required to successfully vapourize these oils into a combustible mixture, though I have no doubt that this difficulty will be successfully overcome. If the carburettors are designed to use only low flash oils, we would still be at the mercy of the oil kings, who would immediately raise the price as soon as the paraffin became a successful competitor to the petrol.

This is a subject of much interest at the present time, and I should like to see the views of other readers on it. Possibly you might be able to get up a series of articles on the subject, with illustrations of some of the most successful paraffin carburettors now on the market.

Further, a discussion as to what would be the best form of carburettor to employ or the lines to be followed in designing one might help to bring this question of fuel to a speedy and successful issue.—Yours truly,

CYCLE MECHANIC.

### MOTOR REVOLUTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just read in one of the daily papers the following:—Mr. Edison has just announced that he has completed an invention which will bring about great changes in the motor-car industry. After a long course of experiments he has found a substitute for lead as a material in the storage battery. For three years 25,000 batteries provided with cobalt instead of lead have been submitted to tests in the Edison workshops at Orange, New Jersey, and it has now been decided that with this metal in the cells a battery can be made that is light, cheap, and practically indestructible. According to the "New York Times," Mr. Edison states that he is able to make, at a cost of 2s., a storage battery that will travel 100,000 miles before it is worn out. Twenty cells are all that will be needed for a brougham, and sixty cells will be enough for the largest and heaviest truck. For £40 one will be able to obtain motive power that will not need renewal for fifteen years. The actual cost of recharging the battery will be no more than a few pence.—Yours truly,

ELECTRIC.

Touring in Spain.—The Entrance to the Convent at Burgos.

### WEIGHT REDUCTION IN MOTOR-CAR DESIGN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In looking over the many interesting accounts of the progress that has been made by the motor-car during the past ten years, there is one point which has struck me as not having received full prominence. I refer to the great reduction of car weight without any resulting sacrifice of strength; indeed, quite probably, with an actual increase in this supremely important quality. This process of weight reduction has been a painstaking one, and has required a most minute attention to details upon the part of motor-car builders. There are two lines along which weight reduction may be carried out. One is by the substitution for materials of construction hitherto used of other materials which possess a higher degree of specific strength to resist stresses of the particular character involved; the other is by the proportioning of each part so that just the amount of material required is made use of to give the requisite strength to resist the maximum stresses to which each part will be subjected in practice. The former line of procedure has been carried out by the practically complete substitution for cast iron of steel and malleable iron castings, and the use of specially compounded steels or nickel steel alloys for steel of common commercial qualities, or in some instances for wrought iron.—Yours truly,

ENGINEER.

### DRIVING PERMIT IN FRANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter from Mr. A. J. McKinney, in your issue of last week, upon the subject of driving permits in France. This gentleman's experience is certainly peculiar, but is probably explicable in the following way:—The official that examined Mr. McKinney's car was authorised to issue or examine cars for the purpose of issuing "permits de circulation," but was not authorised to issue "permis de conduire," or else he presumed that this gentleman had one of the latter. It is customary to address a request in writing to the "Ingenieur des Mines" in the district in which one lands or resides when living in France, so that this official may appoint a day and hour upon which the candidate may be examined, as also the car which he proposes to drive. Mr. McKinney was lucky in not being asked at any time for his "permis de conduire," but this fact merely shows once more that in France the Government and police wish to foster the automobile industry, and not to throttle it as is the case on this side of the Channel.—Yours truly,

ALAN A. L. HICKMAN.

### A HINT TO SURREY MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just received a printed post-card from the Clerk of the Surrey County Council calling my attention to the fact that the Commissioners of Inland Revenue pay to the County Council of our county the amount received in respect of licences for armorial bearings, carriages (including motor-cars and motor-bicycles), dogs, guns, and male servants, pointing out that it is most important all Surrey ratepayers should take out their licences at post offices in the administrative county of Surrey. As Surrey is notoriously the worst county for motorists, would it not be as well to urge all motorists to take out their licences in some other county, and thereby endeavour to teach the magisterial benches that in their bigoted persecution of motorists they are doing their county some harm?

For obvious reasons I omit to give my name and address, as I have already suffered sufficiently, though unjustly, at the hands of the Surrey benches.—Yours truly,

A SURREY VICTIM.

### ROAD IMPROVEMENT IN DEVON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to enclose a copy of a circular letter which we are sending round in order to obtain financial support for a piece of work which it is worth the while of motorists to support. The plans have been approved by the Barnstaple Rural District Council and forwarded to the County Council of Devon, who have referred the matter to the Road Committee. The road coming from the south would allow the avoidance of that dangerous hill at Countisbury and make a good and practicable access to the beautiful scenery at Lynmouth and Lynton. There can be little doubt of its being followed by other road improvements which will cause this neighbourhood to cease to be a terror to motorists. It is to be hoped that a good many may see their way to sending a contribution, which after all will be well saved in tyres and brakes by the proposed new road. I would wish your kind help in this matter, as I am sure that your widely-read journal can do a great deal for us.—Yours truly,

EVAN B. JEUNE.

[We refer to this subject in our Comments.]

### PETROL GAUGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In visiting the recent Show I was much interested in finding a number of useful petrol gauges by means of which one can tell at a glance how much spirit there is still left in the tank. Whether it is due to the fact that in the opinion of the majority of manufacturers the dashboard of the car is already sufficiently encumbered with fittings, there has hitherto been no general tendency to supply a visible tell-tale of the amount of petrol contained in the tank. It is nothing unusual for the present day car to have a reservoir with a capacity of thirty gallons or more; but, as a matter of fact, it is this great capacity that is responsible for the majority of instances in which the fuel supply is allowed to run out. Several manufacturers have provided against this proneness to forget on the part of the one whose duty it is to keep the tank full, by providing an auxiliary tank holding a gallon or so—just sufficient to enable one to continue the journey to the nearest agent. Sometimes the auxiliary supply takes the form of a tank within a tank, and in other cases it is entirely independent of the main source of supply. Useful as this arrangement is, it may seem doubtful if, when the score of expense is concerned, the balance would not be largely in favour of the adoption of some simple form of gauge.—Yours truly,

W. J. MCALPIN.

CLEMENT-TALBOT CARS.—"R. C." writes: "Could any readers of the *M.C.J.* give me any information as to the reliability of the Clement-Talbot cars; are they light on tyres, how many miles on a gallon of petrol will they do, and are they good hill climbers?"

MANGANESE STEEL SHEETING.—In reply to the query of a correspondent in our issue of the 8th inst., we learn that manganese steel sheeting is supplied by Hadfield's Steel Foundry Company, Sheffield.

## CLUBS AND ASSOCIATIONS.

### SCOTTISH.

THE Scottish A.C. are arranging for a series of examinations for Driving and Mechanical Proficiency Certificates to be held on the following dates in 1907:—Glasgow, January 15th; Edinburgh, January 17th; Dundee, January 25th; Aberdeen, January 26th; and Inverness, February 9th. Particulars of these examinations may be obtained by our readers in Scotland from the Secretary, Scottish Automobile Club, 59, St. Vincent Street, Glasgow.

### SOUTHERN.

THE annual dinner of the South London A.C. was held last week at the Trocadero Restaurant, London, Mr. W. Howlett being in the chair. He placed a time limit on speakers which resulted in a series of condensed utterances, much to the taste of the large company present.

Mr. W. L. Lorkin, the hon. secretary of the club, which has nearly a hundred members, recalled the successful gatherings that had been held during the season, and Mr. Allan Vickers proposed the Motor Union, Mr. W. Rees Jeffreys replying. To the health of the visitors Mr. Staplee Firth responded, encouraging motorists with the thought that

Wright, Boston, for Holland. Twenty-three new members were elected, making 184. A resolution in favour of lights on all vehicles all the year round was carried unanimously.

In the evening a dinner was held at the Black Goat Hotel to celebrate the successful formation of the club. Major J. A. Cole was in the chair, Mr. A. W. Foster in the vice-chair. Mr. Robert Todd proposed the toast of the evening. He commented on how in the early days cyclists had joined themselves into clubs for the purpose of protection. He thought this club had made a very successful start. The club could do a lot of good, and materially assist the police, who seemed to be very friendly in Lincolnshire. The Chairman, who responded, referred to the decision of the club as to "cut-outs" and other unnecessary noises, which they intended to do their best to abolish. Mr. Godfrey Lowe, hon. sec. of the Lincolnshire A.C. and vice-chairman of the Lincolnshire M.C.C., proposed "The Centres," which he said would be of enormous value to the club. Mr. A. Mettham, hon. sec. of the Grantham centre, responded.

Mr. A. A. Padley proposed "The Motor Union and Auto-cycle Club." He thought the Motor Union had fully justified its formation. He thought there was no sensation equal to motor-cycling, if the machine was in good order. It was as much superior to riding in a car as was riding a good hunter or sitting in a carriage. Major Cole responded for the Motor Union. Mr. Straight responded for the Auto-cycle Club and suggested work for the new club. Mr. C. Nelson, Mr. J. T. Coleman (chief constable of Lincoln), Capt. H. E. Newsom, Dr. J. H. Pim and Mr. Wilkinson also spoke.

### NOTTINGHAMSHIRE.

THE committee of the Nottinghamshire Automobile Club have arranged a highly attractive programme for the winter months, and the scheme was detailed to the members by the popular president, Mr.

On the way to the Paris Salon.—A snapshot in the Place de la Concorde.

the opposition they were encountering was but a repetition of that which greeted the advent of railways sixty and seventy years ago.

### MIDLAND AUTOMOBILE CLUB.

THE annual meeting of the Midland Automobile Club was held at Birmingham on Saturday, Mr. Thomas Clayton presiding. It was reported that seventy-seven new members had joined during the year, making a total of 277. The committee recorded that no application had been made in any part of the Midland Counties for any special speed limit. The income from subscriptions amounted to over £400, and there was now a substantial balance. The rules were altered to permit of grants being made to charitable objects. Mr. Phillip S. Foster was re-elected president, Mr. T. H. Ryland hon. secretary, and Mr. C. P. Type hon. treasurer.

### LINCOLNSHIRE MOTOR-CYCLE CLUB.

THAT motor-cycling flourishes in Lincolnshire is evident from the success of the Lincolnshire Motor-cycle Club, started on October 3rd by Mr. G. J. Wilkinson, who has been appointed hon. secretary. Already there are very close upon 200 members.

On Wednesday of last week there was a very largely attended meeting of members at the Spread Eagle, Lincoln, and the hon. secretary reported the successful formation of centres at Grimsby, Grantham, and Spalding, and that he was in correspondence with riders at Stamford, Boston, and Louth, with a view of starting centres there.

The rules were adopted, and it was decided that there should be one representative for each fifteen members in a centre on the general committee, and that there should be a representative from each centre of the Auto-cycle Club, the L.M.C.C. having been affiliated. For the three administrative counties the following were elected:—Mr. F. T. Man, Gainsborough, and Rev. Neville Inge, Gayton Rectory, for Lindsey; Mr. Wadsley, Bourne, and Mr. F. N. Smith, Sleaford, for Kesteven; and Rev. Father Dumons, Woodhead Spa, and Mr. S. C.

Charles Hardy, at a club gathering held in the 'Black Boy' Hotel, Nottingham, on Friday of last week. He explained that it had been arranged to hold the annual dinner on January 11th, when they hoped to have with them the Mayor of Nottingham (Ald. J. A. H. Green), the Hon. A. Stanley, M.P., Mr. J. W. Orde, and Mr. Rees Jeffreys. In February Mr. F. Coleman, who saw active service throughout the Manila campaign, would lecture to the club, and Mr. A. New would also read a paper on the "Tourist Trophy Race." The London Biograph Company would exhibit a series of automobile pictures.

### HARTLEPOOLS.

THE second annual dinner in connection with the Hartlepoons Automobile Club was held at the Grand Hotel, West Hartlepool, on Friday of last week, there being a large number of members present. Although the club was only established three years ago, it has been very successful, and there is now a membership of about fifty. Mr. George Jones, J.P., presided, and Mr. C. E. Smith occupied the vice-chair. The Chairman proposed the toast of "The King and Royal Family." Mr. Horace Maclean proposed "The Army and Navy," and Major Rickinson responded. Councillor Boanson proposed the toast of "The Visitors," with which he coupled the name of Major Tomkins. Major Tomkins (Stockton), responding, said he hoped that next year the Hartlepoons Club and the Stockton Club would commence having runs together, because it was a pleasure for two clubs to take runs into the country. Dr. Cockell (Greatham) and Mr. Pringle (West Hartlepool) also responded.

Mr. C. E. Smith, who proposed "The Hartlepoons Automobile Club," said that naturally they all liked to be associated with, or have some hand in the launching, as it were, of a successful undertaking, and he thought that the best and only proof of the success of the club was to take a glance round that festive board. They started that club in a very small way, and when they asked Mr. Jones to be president he was not a motorist, but subsequently the motor microbe got into his path. The movement only started with pleasure cars, but since then it had

developed phenomenally, and at the present time in England alone it employed thousands of workers and millions of capital. There had been many improvements since he commenced motoring seven years ago, for at that time they had a speed limit of twelve miles an hour. Parliament, however, took the matter up, with the result that the limit of twelve miles an hour was turned into one of twenty miles an hour. He hoped that that limit would be abolished, and that the good old law which punishes a man for driving to the danger of the public would soon be brought into force again. The members of the club had had a year free from accidents, which, he thought, spoke volumes for the drivers and owners of cars in the Hartlepool.

The Chairman replied, mentioning at the outset that since he was elected president he had got the motoring fever, and had purchased a car. With regard to legislation, he said there was no doubt that something would be done in the future, but he did not think it would be so drastic as forecasted some time ago, because there were so many members of Parliament who were motorists. There was no doubt that a great deal of the opposition they had to face could be done away with if when they were motoring they would remember that there were other people on the road besides themselves.

The toasts of "The President," "The Secretary," "The Treasurer," "The Entertainers," and "The Press" were also honoured.

### BIRMINGHAM MOTOR-CYCLE CLUB.

AFTER a discussion on ignition systems opened by Mr. E. W. Winckle at the Birmingham Motor-cycle Club, a vote was taken, from which it appeared that a majority of the members were in favour of magneto ignition for motor-bicycles, only two of those present voting for accumulators. In his opening speech Mr. Winckle described the various ignition systems, beginning with the ordinary accumulators, with plain coil and trembler coil, followed by the low-tension and high-tension magneto machines. He also mentioned a plug that was brought out some time ago, which required neither accumulator, coil, nor magneto. Mr. Duke followed with a description of the troubles generally met with when using accumulators, and speaking in favour of magnetos. A vote of thanks was awarded to the United Motor Industries, Limited, for lending an Eisemann magneto machine and coil for a single-cylinder engine, and similar machine and coil for a four-cylinder engine; and to Mr. J. L. Norton, of Bradford Street, Birmingham, for sending a Simms-Boech magneto.

The fourth annual dinner of the club was held at the Colonnade Hotel, Birmingham, on Wednesday.

### MID-STAFFORDSHIRE.

THE first annual dinner in connection with the Mid-Staffordshire A.C. has been held at the Swan Hotel, Stafford. The Rev. S. Wickham Jones presided, and there were also present the Mayor (Councillor Andrews), Dr. Nesfield Cookson, Messrs. C. H. Riley, A. Wenger, E. W. Breton (deputy chief constable), R. Meade, F. Riley, R. Silvester, W. H. Peach, A. Amies, L. W. Potts, W. Seers, J. F. Wiltshaw, C. Heald, W. H. Scott, W. H. Riley, G. Brindley, H. Bird, J. H. Mottram, C. W. Miller, H. Charrington, T. A. Batkin, and T. Bailey. Letters of apology for inability to be present were received from the President (Lord Shrewsbury), Lord Ingestre, Mr. H. D. McLaren, M.P., Sir Alex. Henderson, Capt. the Hon. G. A. Anson, and others. After dinner Mr. Potts proposed "Success to the Mid-Staffordshire Automobile Club and Motoring generally," and the Rev. S. Wickham Jones, in responding, said that since the formation of the club in March, 1905, the membership had been doubled. They had held hill-climbing contests at Milwich, after which the members had tea together at the Crown Hotel, Stone, and at Oakamoor, when the members were entertained at Moor Court by Mr. T. A. Bolton. The members had also been invited to a meet at Ingestre, where, in the absence of the President, they were received by Lord and Lady Ingestre. The members had run their cars at Stafford for the benefit of the Hospital Saturday Fund and raised £10 11s. 6d., and at Stone about £7 was realised. The chairman, on behalf of the members, presented the hon. secretary (Mr. H. Charrington) with a handsome spirit tantalus and salad-bowl in recognition of his services to the club since its formation. Mr. H. Charrington acknowledged the gifts in suitable terms. Mr. C. H. Riley proposed "The Visitors," to which the Mayor, Messrs. E. W. Breton, W. H. Peach, and W. Seers responded.

### YORKSHIRE.

THE seventh annual dinner of the Yorkshire Automobile Club has been held in the Hotel Metropole, Leeds. There were over a hundred guests, and Mr. A. W. M. Boaville (vice-president of the club) occupied the chair. The chairman, in proposing the toast of "The A.C.G.B.I., the Motor Union and affiliated clubs," spoke of the good work the various clubs had accomplished.

Referring to the roads and taxation questions, the Chairman said he saw something of the other side of the question, because, as well as being a motorist, he was a member of various councils. In the old coaching days the highways were supported out of the toll money, and thus those who used the road paid for the road. When the railways came, through traffic on the roads ceased and the toll-bars were abolished, the roads being maintained by parish authorities. The

first thing that awoke the slumbering road was the tinkle of the bicycle bell. If motorists were to be taxed, as he supposed they would be, was it not time they began seriously to think whether the management of the roads was right? This was a difficult problem, but it would have to be faced. If they were to be taxed, let them pay the tax to some purpose, so that they might avoid any ill-feeling with the road authorities.

In responding, Mr. E. H. Hepper advocated the lighting of all vehicles, and the carrying of a rear light on all vehicles. Clubs like theirs, he contended, were doing the most to stamp out the road hog. No amount of police traps and fines would accomplish this. Mr. Gordon Learoyd (Huddersfield) also responded.

### AUTOMOBILE ASSOCIATION.

IN view of the festive season the executive of the Automobile Association have instructed their patrols, who will be on duty for five consecutive days, not to look too closely for the A.A. badge when called upon for help. This concession naturally cannot last for an indefinite time, but it is hoped that every motorist not already a member of the A.A. who may benefit by it will include membership of the Association among his New Year's resolutions.

LAST week the Chatham and District Motor Club held their first smoking concert.

THE members of the North-East Lancashire A.C. have presented their hon. secretary, Mr. A. Birtwistle, with a silver tray in recognition of his recent marriage.

COL. BOWLES, J.P., the chairman of the North London A.C., has invited the members of that flourishing organisation to hold their gymkhana next year at his residence, Forty Hall, Enfield.

### COMPANY NEWS.

#### NEW COMPANIES REGISTERED.

CAVE RIMS.—£5,000. To take over from Mr. C. B. Cave-Brown-Cave and Mr. J. B. Nicholson the business of manufacturers of and dealers in rims for motor-cars and vehicles carried on by them in Chesham, or elsewhere, as the Cave Quick-change Tyre Rim Syndicate. First directors, Messrs. J. B. Nicholson (chairman), C. B. Cave-Brown-Cave, and H. C. Walker. 72, Victoria Street, S.W.

STEVENSON WHEEL COMPANY.—£10,000. To adopt an agreement with Messrs. T. Stevenson, S. Stevenson, and D. Stevenson, of Glasgow, and to carry on the business of wheelwrights. The first directors are Messrs. T. Stevenson, S. Stevenson, B. B. Tuke, and W. Wright. The three first-named or the survivor or survivors of them, may, while holding half the ordinary shares, nominate two directors. The said T. and S. Stevenson are the first nominees. A. du Cros or his executors may, while holding 37½ per cent. of the ordinary shares, appoint one director, the said B. B. Tuke being the first so appointed.

#### COMPANY MEETINGS.

THE DAIMLER COMPANY.—An extraordinary general meeting has been held at Coventry to pass a resolution for increasing the borrowing powers of the company, which were limited to £60,000, of which £49,800 was outstanding in respect of debentures. Mr. E. Manville (chairman), who presided, said that debentures amounting to £10,200 had been redeemed, and that left them with a margin which was quite inadequate for a business of the size of the Daimler. He, therefore, moved, "That the power of borrowing money conferred upon the directors by the articles of association be extended to an amount equal to the nominal amount of the issued capital of the company for the time being." Captain Longridge (director) seconded, and the motion was carried unanimously.

PULLMAN, LTD.—The general meeting of R. and J. Pullman was held on Tuesday, Mr. E. E. Pullman, managing director, presiding. A greatly improved balance-sheet was presented, the profit shown amounting to £4,484. Reference was made to an early removal of the London address, and Mr. T. Croysdale, one of the directors, said that the non-skid introduced by the firm had become a valuable adjunct to their business. The report and balance-sheet were adopted and a dividend of 6 per cent. declared on the preference shares. Messrs. G. J. Nesbitt and A. Heiron were re-elected directors, and a vote of thanks to the chairman and his colleagues concluded the proceedings.

#### REPORTS AND BALANCE SHEETS.

THE report of Singer and Co. to August 31 states that the profits from all sources amount to £13,557 5s. 7d., and, after allowing for depreciation on plant, machinery, stock, patents, lands, and buildings, and also for directors and trustees' remuneration, there remains a net profit of £9,620 7s. 3d. After paying debenture interest for twelve months to August (£8,000), there remains £1,620 7s. 3d. in reduction of last year's deficiency. The motor department did not, up to the end of the financial year, show the improvement the board had anticipated, but in the interval the efforts which have been going on have resulted in the production of a new car, for which large orders have been received. In order to deal with the demand it has become necessary to provide an additional working capital of at least £20,000. This it is proposed to arrange for in connection with the Singer Motor Company, which was

registered in 1903 with a nominal capital of £1,000, of which fifty-seven shares, all held by Singer and Co. or their nominees, have been issued.

**PAGE BROTHERS.**—£2,000. To take over the business of motor and cycle manufacturers carried on by E. A. Page and C. L. Page at Brixton. Managing directors, Messrs. E. A. Page and C. L. Page. 162, Acre Lane, Brixton, S.W.

**THE British Motor Body Company (Ltd.)**, Bannermill Links Road, Aberdeen. Capital £5,000, divided into £1 shares. The subscribers include Messrs. Claud Hamilton, Alexander Fergusson, H. Prosser, H. G. Rennie, N. Clement Boyd, Robert D. Fraser, C.A., G. A. Lombazis.

**ROLLS-ROYCE, LTD.**—Applications for 100,000 Preferred Ordinary shares in Rolls-Royce, Ltd., have been invited during the past week.

### AN ENGLISH MOTOR RACING TRACK.

THE offices of the Brooklands Automobile Club, which has been licensed by the A.C.G.B.I. to hold motor race meetings on the new track near Weybridge, are at Carlton House, Regent St., W., and the committee, from among whom the stewards at each meeting will be appointed, comprises:—The Earl of Lonsdale (President), Lord Montagu of Beaulieu (Vice-President), the Duke of Beaufort, General Sir Redvers Buller, G.C.B., Viscount Churchill, G.C.V.O., Earl of Dudley, G.C.V.O., Earl of Essex, Col. H. C. L. Holden, Major J. F. Laycock, Lord Northcliffe, Mr. J. W. Orde, Mr. H. Owen, Mr. C. D. Rose, M.P.,

The Byfleet Plate of 550 sovs., for cars with engines of a cylinder dimension 110 to under 135 mm. Course about ten miles.

The Naval and Military Plate of 450 sovs., for cars with engines of a cylinder dimension 45 to under 60 mm. To be owned and driven by commissioned officers of His Majesty's forces on the active list. Course about six miles.

The First Montagu Cup of 2,100 sovs., for cars with engines of a cylinder dimension 155 to under 235 mm. Course about thirty miles.

The Marcel Renault Memorial Plate of 550 sovs., for cars with engines of a cylinder dimension 85 to under 110 mm. Course about twelve miles.

In all cases, except in that of the Montagu Cup, where the weight is specified as being 2,600 lbs., the weight is described as 3,000 lbs. The entrance fees are on a graduated scale, ranging from ten to 150 sovereigns, according to the promptitude with which they are made.

### THE RESPONSIBILITY FOR ACCIDENT.

IN the Civil Court at the Leeds Assizes the claim by William Harwood and Robert Willerton, Sheffield, who sought to recover damages from Reuben Thompson, owner of the motor-car garage, Sheffield, for personal injuries arising from a motor-car accident, has been tried. The plaintiffs hired a motor-car from the defendant for a

The Photographs herewith illustrate three stages of the Daimler System of Packing Cars for Foreign Shipment. The work is carried out with great care, and after many years' experience no case is on record of any damage in transit.

Earl of Sefton, Hon. Arthur Stanley, M.P., H.S.H. Prince Francis of Teck, Lord Tollemahe, Capt. J. H. Greer and the Duke of Westminster. Mr. H. Brown is the secretary of the club.

The committee have provisionally reserved the following dates for race meetings in 1907:—May 18th, June 13th, 22nd, and 27th, July 6th, 13th, and 27th, August 10th, September 14th and 28th, October 19th, November 2nd.

Plates will be offered at first, but subsequently it is intended to have frequent sweepstakes, and, when sufficient experience of racing on the track has been gained, handicap races and selling plates will be organised. The range of dimensions selected for different races will vary constantly, but each race identified by a name will be run under the same conditions of weight and dimensions whenever that race is repeated. Of the races announced below the committee intend that the Montagu Plate shall be repeated at least four times.

The races for which the entries close on April 2nd, 1907, and which it is hoped will be run at the May meeting, are as follows:

The Horsley Plate of 300 sovereigns, for cars with engines of a cylinder dimension 60 to under 85 mm. Course about three miles.

The Gottlieb Daimler Memorial Plate of 650 sovs., for cars with engines of a cylinder dimension 120 to under 125 mm. Course about fifteen miles.

run into Derbyshire, the car being driven by the defendant's chauffeur. The plaintiffs alleged that the driver travelled at an excessive pace, with the result that, in endeavouring to take a sharp corner, the car ran up an embankment. The plaintiffs were thrown out, and both seriously injured on the shoulder, ankle, and ribs. The plaintiffs, in evidence, said they frequently told the driver to moderate his pace, but he declined to do so. Mr. Ellison, for the defence, stated that the accident was solely due to the breaking of the steering gear, this preventing the car from taking the corner. The jury found for the plaintiffs, and awarded Harwood £130 damages, and Willerton £80.

### POLICE TRAPS.

READERS who become acquainted with police traps during the Christmas season are invited to favour us with particulars of the same, so that we may warn others.

TRAPS have lately been established on some of the roads outside Glasgow. There is one in the village of Fenwick, on the road to Kilmarlock.

THE police have lately displayed considerable activity on the Ilkley to Bradford road.

## CASES UNDER THE MOTOR-CAR ACT.

### RECKLESS DRIVING.

Mr. Paul Taylor has had before him at Marylebone Police-court, Charles Williamson, chauffeur to Mr. W. H. Lever, M.P., who was summoned for driving at a speed dangerous to the public, also for failing to give warning of his approach. About six o'clock p.m. on November 21st the coachman to Dr. Henderson was at Haverstock Hill in charge of a pair-horse carriage. Having set down his master on the west side, and seeing the road clear, he turned his horses and got three-quarters across the thoroughfare when he saw the motor-car coming down the hill behind him at a tremendously fast pace. The next moment the defendant's car dashed into the space between the carriage and the kerb. The carriage was turned completely round, the horses reared and then bolted, and the coachman was thrown from his box, and received serious internal injuries. The defence was that the car was going at the moderate speed of fifteen or sixteen miles an hour, but the night was dark. The carriage turned unawares, and he (defendant), to avoid the carriage, tried to pass him on the near side. The magistrate fined the defendant £5, with £2 9s. costs.

### A QUESTION OF IDENTIFICATION.

At Marlborough Street Police-court, London, on Saturday, George Brown was summoned, before Mr. Denman, for driving a motor-car in a manner dangerous to the public. Mr. E. F. Barker prosecuted on behalf of the Commissioner of Police. Thomas Hale, a carman in the employment of the Great Western Railway Company, deposed that while he was driving a pair-horse van along Oxford Street in the afternoon on November 21st, close to a refuge, a motor-car going in the same direction tried to pass between his van and the refuge. There was not sufficient room, and the car "caught" his off-side horse, threw the animal on its knees, causing injuries which necessitated it being kept from work for about fourteen days. The car passed out of sight "like a flash of lightning." Constable Hancock, D division, said that owing to information received he, on the day in question, went to old Cavendish Street, where he saw a motor-car. The defendant was the driver, and along with him was Mr. Ralph Grigg, the owner of the car, which was then standing still. When the defendant was asked if he knew there had been a collision he said the driver of the van pulled out after seeing the front of the car pass. The defendant, on oath, said he was not driving the car at the time in question. His employer was driving. Mr. Denman, in giving his decision, said he thought when the constable arrived upon the scene Mr. Grigg ought to have told that officer that he was driving the car at the time. As it was shown that the defendant was not driving the car at the time the summons against him would be dismissed. Mr. Barker asked for a summons against Mr. Grigg, which was granted.

### PUBLIC MOTOR SERVICES.

At a meeting of the Society of Motor Omnibus Engineers, held at the Hotel Cecil, London, on Monday, Mr. A. A. Campbell-Swinton said there were 789 motor-omnibuses running in London last month; each omnibus carried on an average 800 passengers a day. The motor-omnibuses in London were therefore carrying 184,000,000 passengers per annum, and were taking £1,000,000 per annum, or £4 gross earnings per omnibus per day.

THE Fulham Borough Council has come to an arrangement with the London General Omnibus Company, Ltd., the London Road Car Company, Ltd., the London Motor Omnibus Company, Ltd., and the London and District Motor 'Bus Company, Ltd., to accept one-half of the cost of reinstating any street lamps knocked down or damaged by motor omnibuses belonging to them.

THE shareholders of the London Motor Omnibus Company, Ltd., have received a synopsis of a scheme, recommended by the Board, which aims at an important amalgamation of the motor-omnibus services. It is proposed that the undertaking of the London Motor Omnibus Company "Vanguard," the London and District Motor 'Bus Company "Arrow," the Motor 'Bus Company "Pilot," and the London and Provincial Motor 'Bus and Traction Company "Arrow," shall be combined in a new company, with an authorised capital of £1,200,000. The name suggested is the "Vanguard" Motor Omnibus Company.

THE conference of Metropolitan authorities to which reference was made on page 916 of our last issue, and which was sitting as we went to press, finally adopted a resolution expressing the desirability of securing more efficient supervision of motor traffic in London.

IN the Court of Appeal, before Lords Justices Vaughan Williams, Moulton, and Buckley, the matter, Attorney-General v. Mersey Railway Company, heard some days ago, has again been mentioned. Acting on behalf of the Birkenhead Corporation, the Attorney-General had applied to Mr. Justice Warrington for an injunction to restrain the Mersey Railway Company from running omnibuses in Birkenhead which not only conveyed passengers to their railway stations, but accommodated "pick-up" passengers who were not going to the station. His lordship granted the injunction on the ground that the business of omnibus proprietors was neither incidental to nor consequential upon the business of a railway company. From that decision the defendants appealed last week, and, conditional upon their giving an undertaking to abandon the "pick-up" traffic, the Court said the injunction would be discharged. The matter was adjourned to allow the parties time to consider the

position, and when the matter was mentioned again it was stated on behalf of the railway company that they were prepared to give an undertaking that the omnibus service should be run as a service for railway passengers, and as far as was reasonably practicable it should be confined to passengers going to and from the stations. In these circumstances the Court discharged the injunction, except in so far as it referred to the cost of the original application, and made no order as to the costs of the appeal. The buses referred to in the case were motor-buses.

### CHAUFFEUR v. EMPLOYER.

MR. ARTHUR ROBERTS was sued in the Westminster County Court by a chauffeur for the recovery of £7 17s. 6d., salary said to be due in lieu of notice. Mr. J. S. Merton, for the defence, said that the plaintiff was dismissed in consequence of negligence while in Ireland. He ran Mr. Roberts's car into a cow, and damaged the lamps, and later on, in Glasgow, he ran into a Corporation tramcar and did damage to the extent of £30. After that he ran into a wagon, and smashed up a second car. His Honour gave judgment for the defendant in respect of the claim for salary, and said he could not conceive how the plaintiff had been induced to bring the action. As to the claim for certain items which the plaintiff had expended, and which the defendant admitted, there would be judgment for the plaintiff.

### ROAD REPORTS.

KENT.—There are no repairs contemplated in the Foles Cray district of Kent for the next six months at least.

HERTFORD.—With the exception of about a furlong on the Hitchin road, the authorities in the Baldock district have finished their repairs for this season. They never take in hand more than about 300 yards at one time on the main roads and put the roller on immediately. About April or May they will be laying about nine furlongs of water mains on the Stevenage road, but it will not be necessary to divert traffic as the roads and streets are very wide. Since the King has passed this way no less than seven times during the past six months, the main street may well be termed the "King's Highway."

LEICESTERSHIRE.—Two short lengths of main roads in the Coalville district will be under repair during the course of the next week or two, just at the entrance to Coalville from Leicester, on the Leicester and Ashby main road, and the centre of Hugglescote, on the main road leading from Market Bosworth to Coalville.

MIDDLESEX.—It is not anticipated that it will be necessary to carry out any extensive repairs on the main roads of the Brentford district during the next few days.

ACTON.—There is only one main road in the Acton district. This is wood paved and under the charge of the Middlesex County Council, being kept continuously in repair under a contract.

"DAIMLER SUCCESES IN 1906" is the title of a very handsomely got up pamphlet which the Daimler Motor Company, Ltd., has just issued. The successes of this car during the past season have been so numerous that it is not surprising to find the booklet extend to close upon forty pages, the interest being increased by the numerous illustrations which accompany the text.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London; W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment or some is directly specified in forwarding, and the terms arranged before publication.

# Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, DECEMBER 29, 1906.

[No. 408.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## NEW YEAR'S GREETINGS, 1907.

Good wishes we send in the form of a sonnet,  
And hope that you'll ne'er have a bee in your *bonnet*.  
That your joys and your pleasures may ever be such,  
Of despair, and of sorrow, you'll ne'er feel the *clutch*.  
Disappointments and cares may you meet without fear,  
May you never feel tired, never get out of *gear*.  
That as time passes onward you'll find there's no need  
To go racing through life at the very *top speed*.  
Then remember, sincerity's better than gush,  
And a bird in the hand is worth two in the *bush*.  
If you've illness, don't let it e'er get a fixture,  
But obtain for yourself at once the *right mixture*.

You'll find, too, no doubt, that it is most essential,  
That your manner is good, sometimes, *differential*.  
May you ever succeed now in making your mark,  
May nothing and no one e'er *retard* your *spark*.  
Now we hope that your joys will increase more and more,  
That of good things you'll be an *accumulator*.  
Then may you face bravely hard times and bad weather,  
And remain to the end in capital *feather*.  
In conclusion, we wish that your cars, every sort,  
May run very well in the manner they ought.  
Of disasters and punctures may you have no fear,  
May you have, from the first to the last, a good year.

L. B.

## COMMENTS.

UNDER the auspices of the Aero Club, the Aero Club Institute is being formed to encourage the study of aeronautics in all its branches, and to examine and report on proposals for practical aviation. Now that the public interest in the navigation of the air has been thoroughly whetted, and inventors are giving the matter serious study, we commend the new Institute to the support of our readers. In addition to the objects already mentioned, it will also endeavour to assist members in competing for the prizes arranged by the Aero Club, and will provide a meeting place for all at work on the problems that are arising in connection with the new movement. The subscription has been fixed at a low rate, and further particulars can be obtained from Mr. H. E. Perrin, the secretary of the parent organisation, at 166, Piccadilly, W., who will also send information to persons interested in the Aero Club Section of the International Motor Car Exhibition at the Agricultural Hall, London, which will inaugurate the automobile season of 1907.

### Organisation.

THE necessity for the organisation of motorists may be less urgent than was the case five years ago, but its importance is almost as pronounced. Hence we would suggest that among the New Year's resolutions which our readers will probably make should be one to join one or other of the societies that exist for the defence of motorists or the advance of the movement. Especially is this desirable in the provinces, where the existence of a virile association of motorists may prevent the imposition of speed limits and lessen the prejudice of the police. And yet there are many places where motorists have held aloof from the organisation formed for their behalf and protection. At Huddersfield, for example, there are more than 300 owners of automobiles in and about the town, yet only just over 100 of them belong to the very active local branch of the Yorkshire A.C. This is all the more surprising when the good work of the Centre is recounted—their efforts having been directed towards creating a good feeling between the townsmen and themselves, as

well as making useful suggestions to the Corporation with regard to the provision of notice-boards, &c.—proposals which, we have lately learned, have been adopted by the authorities. All these things are for the good of the motor-car movement as a whole, and what has been done in this area of Yorkshire has been carried out elsewhere. Hence the view that it is one of the first duties of the motorist to become one of the organised body which constitutes the Movement.

### Ten mile Limits.

THE year, which has been singularly free from applications from local authorities for the restriction of speed limits, closes with the issue of two ukases from the Local Government Board which will come into force with the New Year. Recently, the Guildford Town Council applied for such a limitation, and an inquiry was duly held. The result has just been made known, the petition of the authorities having been acceded to so far as several thoroughfares are concerned, notably in the London road, from the point where it joins the High Street, for a distance of 140 yds.; the High Street; the Town Bridge; and portions of the Portsmouth, Farnham and Epsom roads, nearest the main thoroughfare. Motorists journeying southward on and after Tuesday next should remember the ten mile limits in the vicinity of Guildford.

### Speed Limit at Newmarket.

CONSEQUENT upon repeated complaints of the danger to racehorses, their riders, and the public owing to the speed at which many motor-cars pass through Newmarket Urban District, especially the High Street and the approaches to the racecourse and training grounds, application was recently made to the Local Government Board through the West Suffolk County Council to impose a speed limit of ten miles per hour from the Bury Road Toll Bar, through High Street to the Cambridge Road Toll Bar, Newmarket, a distance of three miles. A public inquiry was subsequently held. The Local Government Board, however, has just issued its sanction to the speed limit, but it is understood that it will not come into operation until the councils have notice-boards erected, which will probably be early in the New Year.

It will be remembered that although the automobile organisations gave evidence at the inquiry, they did not seriously oppose the suggestion for a speed limit owing to the exceptional circumstances of the case.

### Glaring Headlights.

THE Council of the Chambers of Agriculture have been considering the report of the Royal Commission on Motor-Cars, expressing general agreement with the same, with the exception that they are opposed to any relaxation of the speed limit, and believe that the increase which has been noticed of late in the cost of road maintenance should be met by a further tax being imposed on automobiles. They have also been considering the glaring lights with which many cars illuminate the road, frightening horses which are travelling in an opposite direction—so it is alleged. One of the leading speakers drew attention to the necessity for a cover to slip over the lamps on the approach of other vehicles; but this idea of sudden transference from light to darkness is based on a somewhat erroneous conception of the remedy. The only satisfactory solution is to

Touring in France. At the Gates of the Monastery of the Grand Chartreuse.

be found in those devices which secure a brilliant lighting of the road surface itself, whilst being unaccompanied by the glare straight ahead. Fortunately lamp manufacturers generally are fully alive to the necessity of meeting this new need, and many excellent examples of really efficient headlights, where the light is not sufficiently blinding to prove a danger to other travellers, have been brought out during recent months. As in the case of cars, the objectionable features of headlights will gradually be eliminated, if, instead of wholesale condemnation, the critics of the automobile will exercise a little patience, and give encouragement where efforts at improvement are made.

### The T.T. of 1907.

WE have received a copy of the Regulations for the International Tourist Race of the A.C.G.B.I. for next year, a feature in which is the offer of special awards for cars which are entirely of British manufacture. The distance of the race is to be within the 150 and 300 mile limit, and the cars will be required to run on an allowance of one gallon of

spirit with a specific gravity of 0.715 to 0.725 at 60 deg. Fahr. for every 25 miles. This will also be supplied for practising purposes if desired. In view of last year's experience ballast will have to be carried in the form of lead instead of sand and must be secured before the race begins. Although next year the cars will be started in the order of the receipt of the entry, the committee reserves the right to decide the order of starting by ballot in subsequent years. The entrance fee has been fixed at £25 per car if received before May 1st.

### The Chassis and the Body.

IN past years much discussion has taken place with regard to the "imitation touring bodies" which have been fitted to cars competing in the event, and on the last occasion one private owner withdrew his entry when he went to Manxland and saw the class of bodies with which chassis were allowed to be fitted. We trust that the committee will see that regulation 10—"the body shall be substantially constructed"—is really adhered to by entrants. This rule also provides that "the body shall be easily removable, by undoing not more than six bolts or hinges, and this removal of the body shall not entail disconnecting any part of the ignition apparatus, mudguards, lubricator connections, fuel pipe work, the fixings of any tank, or any pipe connection to the tank." Efficient mudguards are also to be fitted to front and rear wheels, and must be flat and set without splay. The steps should be continuous with the mudguards, and steps and mudguards must be attached to the chassis only. The width of the front mudguards shall not be less than 10 in., and of the back mudguards and footboard not less than 8 in. No part of any mudguard or footboard shall be less than 8 in. from the ground when the car is fully loaded. Efficient silencers must be fitted to all cars, and no form of auxiliary exhaust release will be allowed to be fitted. With regard to the dimensions of the chassis, it is required that the track shall not be less than 4 ft. 6 in., the distance from the dashboard to the front edge of the back tyres shall be at least 5 ft. 3 in. The platform behind the dashboard must be not less than 7 ft. 6 in. long, and the body must cover that area, while a clearance of at least 8 in. must be maintained from the ground when the car is fully loaded.

### Motor Launches on the Thames.

THERE are no fewer than 400 motor-launches registered with the Thames Conservancy Board, at last week's meeting of which it was reported by the General Purposes Committee that they had considered the question of the arrangements to be made under the Thames motor-launch by-laws for the inspection of petrol motor-launches prior to the granting of certificates of compliance with structural requirements. They were of opinion that a careful examination by an expert of undoubted authority would be required, especially at the inception of the system, when alterations of existing installations would probably be necessary in many of the vessels now in use, and questions of a highly technical character might arise. Sir Boverton Redwood was prepared to undertake the inspection. The charge of £500 which it is expected the inspection will take will fall on the Conservators, as they have no power to require the owners to pay the inspection fee.

### A Year Book.

As compactly printed as in previous years, and with every care taken to secure the needful accuracy in such a publication, the "Daily Mail" Year Book for 1907 constitutes a useful handbook on the questions of the day. As might be expected, the references to motor and road questions are fairly complete, although we do not understand why the Automobile Association and some other organisations connected with automobilism have been omitted from the list of societies while more space has been given to the Road Club than has

been allotted to the A.C.G.B.I. The membership of the Motor Union is set down as 11,000; "an increase during 1905 of 4,000." Surely there should be no difficulty in bringing this a little closer up-to-date, and, in view of the tests we have applied to other sections which we have found faultless, it is unfortunate that a glance at the motor-car section should have revealed this weakness. We have, however, nothing but praise for the synopsis of the findings of the Motor Car Commission; the lucid statement with regard to traffic in London and the problem of the highways; as well as the chapter by the Rev. Arundel Whetton, who has managed to find a new phrase in connection with the movement when he says that "the Post Office has decided to motorise their coach services as readily as possible."

#### Distinctions for Drivers.

THE idea that medals or diplomas should be given to those drivers who remain for certain periods of service in the same employ is one that is likely to be favourably considered by the executive of the A.C.G.B.I., to which it has been referred by a committee. We believe that the present intention is that these awards should only be made to those drivers who hold mechanical or driving certificates of the Club, a fact which should secure an even greater importance being attached

enterprise, with the representatives of the Government playing the part of "observers" or travellers. Surely they can do something more than this.

#### Protection from Wind and Rain.

MR. ERNEST ESTCOURT, of Wroxham, Norfolk, is a pioneer motorist, and was a most regular attendant at all the earlier meets and tours of the Automobile Club when the cosy Whitehall Court premises promoted the social instinct among members in an infinitely better degree than is possible in a larger club. He was always demonstrating little improvements and ever ready to place them at the command of others. Now he sends us particulars of his plan for sheltering from wind and rain while driving, and the illustrations herewith will assist our readers to a clear idea of the principle involved. It will be noticed that the main feature of this wind shield is the sloping glass. This is always in use by Mr. Estcourt. Should a sudden storm come on, the occupants of the back seat can always put up the hood without stopping the vehicle. The sloping top screen will be found sufficient protection for the front seat, and it is seldom that anything else will be required; but an extension of the Cape cart hood can be fixed between the screen and hood in a few minutes. This forms a very snug arrangement. The important point in the construction of the device is to have the

Two Views of the Adjustable Glass Screen on Mr. E. Estcourt's Car

to these examinations than has hitherto been the case. Regard will also have to be paid to the condition of the driver's licence, and this may sometimes mean an official review by the Club authorities of the evidence given against a driver in any case in which he may be unfortunate enough to incur a magistrate's displeasure, for to accept endorsements on licences as evidence of the man's ability or character would be obviously unfair.

#### Professors of Automobilmism.

"SLOW, but sure," is the most accurate form of reference to the technical education movement now going on in this country with regard to automobilism. In Spain the young King has accelerated the pace somewhat, and has appointed a Professor of Automobilmism in the School of Arts and Crafts in Madrid. Possibly similar encouragement may be given in Britain when a more insistent demand is made, and it would certainly be to the national advantage if this branch of engineering received more distinct recognition from the authorities at the Universities. Research work is still wanted in many directions, and many technicalities are ready for investigation in the laboratories of the Universities. The subject is a real "live" one, and some of the money, that is now devoted to ancient science might well be applied for modern movements. At present all trials and tests have to be undertaken by private

sloping glass screen not higher than on a line with the driver's eye. The slope of the glass entirely obviates all danger of reflection from the lights of the rear, and the general plan seems a very good one. We shall be pleased to hear from other readers who have made equally interesting and useful accessories for their cars; while general suggestions on the subject would doubtless be read with profit.

#### The Motor-Bus Amalgamation.

AT the extraordinary general meeting of the London Motor Omnibus Company, Ltd., on Friday of last week, Mr. A. T. Salisbury-Jones, the chairman explained the scheme in which the new company would have a nominal capital of £1,000,000 in preference and ordinary shares and £200,000 in debentures. The new company will have a fleet of 600 motor-buses, as compared with the 300 to 400 now running by the four concerns included in the amalgamation. This should, on the basis of the experience already gained, enable them to carry 200,000,000 passengers a year, and secure an income of a million sterling. At the meeting of the Motor 'Bus Company, Ltd. which was constituted about ten months ago, Mr. S. Wheeler, the chairman, mentioned that their garage in Shrubland Road, Dalston, is capable of accommodating 140 buses, fifty of which have been delivered, and about a score are coming forward

every month. Mr. A. A. Campbell Swinton presided at the meeting of the London and District Motor 'Bus Company, which has fifty motor-buses and a garage not far from the Fulham Road, capable of housing 200 motor-buses. Mr. Swinton subsequently took the chair at the meeting of the London and Provincial Motor 'Bus Company, which, although only running ten 'buses at the present time, has a hundred on order, the chassis being made by Messrs. Armstrong, Whitworth and Co. In the end the various gatherings declared in favour of the amalgamation, which should certainly make the problem of the metropolitan motor-buses a very interesting one, having regard to the presence of other competing companies against one so well situated as this will be for the organisation and administration of its men and machines.

#### The Car as a "Jiffy."

THERE is little that is new in Lady Violet Greville's fascinating article in the "Rapid Review" on how the motor has revolutionised Society. The cars "came, saw and conquered. The earliest were built for"—and by, Lady Greville might have added—"enthusiasts, the next for millionaires who wanted expensive toys, but the succeeding ones served for ordinary ones with purses not so long." That is the stage at which motor-cars have arrived, killing the "Liver Brigade" that was wont to ride in the Park, and causing the boatmen on the river to complain of lack of custom. The distinguished authoress rushing describes the joys of speed, and in an excess of enthusiasm declares that "Romance comes with the motor, facilitating quick-travelling elopements. The youth snatches up his bride and conveys her in a jiffy from her parents." Really we must protest against motor-cars being designated by such a word—the incursion of which into Lady Greville's vocabulary is indeed a startling sign of the times.

#### Bills in Parliament.

AT the last meeting of the Committee of the Motor Union the secretary submitted a list of private Bills to be introduced into Parliament which he had had prepared from the notices appearing in the "London Gazette." It was resolved to take steps to obtain copies of the more important Bills and also agreed that the examination of these Bills, to see whether they contained any provision restrictive of automobilism, is a very important matter. The committee would be glad if any members of the general committee who are interested in this department of the Union's activity, would communicate with the secretary, with a view to their names being added to the committee. Local clubs, too, should see the way in which private Bills may affect their districts.

#### Motor Union Insurance.

THE action of the Motor Union in forming its own insurance company for the exclusive benefit of its 14,000 members has been followed with great concern in automobile circles. That interest will be stimulated by the publication of the insurance prospectus of the company. The insurance scheme provides that the Motor Union shall be directly represented upon the board of management, with the result that its representatives have been able to secure for members some unique insurance facilities which the Union had been unable to obtain through existing agencies. The policies of the company, the issue of which will commence on New Year's Day, are free from limitations, and cover the car when driven not only by the owner or his paid driver, but when being driven by any person licensed to drive a car. An important feature of the policy is designed to secure that a car disabled in an accident shall be upon the road again within a few days. This result is secured by: (1) Giving the assured authority to cause repairs to the value of £2 10s. to be carried out without waiting for the company's sanction; and (2) paying special compensation of £1 per day if the repairs to the

car are not completed within fifteen working days from the date of the acceptance of the estimate for such repairs by the company.

#### Motor-Boat Trials.

A JOINT meeting of the special committee of the Motor Yacht Club and the Society of Motor Manufacturers and Traders was held on Wednesday of last week, when further alterations were made in the rules for the reliability trials for 1907. The position of those manufacturers who declare the price of their boats is safeguarded by an addition to the rule which renders the guarantee "subject to market fluctuations in the price of material." A provision has been made for the safeguarding of any boats that may be berthed outside the dock, and a penalty imposed on any competitors who commit a breach of the rule of the road. Various other alterations will be found which will simplify and at the same time make certain rules more comprehensive. Classification has been entirely revised, rendering it much easier for the general public to distinguish between the different classes. The scale of marks has been greatly enlarged, and a new heading, "Design and construction of hull," introduced. Competitors will be required to be in dock by mid-day, so that the judges may make a preliminary examination of the boats, though on payment of a fine late arrivals will be admitted up to a certain time.

#### Provincial Gatherings.

So much interest has been taken in the provincial gatherings of the Motor Union that the first notes which motorists should make in their new diaries are the following, with reference to the meetings of that organisation in the country:—May 18th, Lincoln; July 20th, Southport; Sept. 14th, Leicester. Several other places gave invitations, but, after due consideration, the foregoing were selected for the honour. Southport will thus have the distinction among seaside towns; Lincoln will introduce strangers to new fields of antiquarian interest, and the city will afford some hill-climbing tests in ordinary traffic; while Leicester will present the picture of a modern industrial town that has always proved friendly to our movement. At all these towns the resident motorists are well organised and the meet should prove highly popular.

THE Wolseley Company's new garage in Manchester is now available for members of the Motor Union on favoured terms.

MESSRS. FRISWELL (1906), LTD., have instituted a general agency department for the purpose of supplying any make of car, taking any secondhand car in part payment. Not only has there often been difficulty in disposing of old cars to advantage, but also in selecting the new one. By the new plan motorists will be able to quickly dispose of their old cars, taking Peugeot, Westinghouse, Standard or any other type of car in exchange with, of course, the necessary money payment to make up the purchase price.

LADEN with Christmas parcels, the Birmingham to Worcester motor mail, which came to grief on a steep hillside some time ago, was again in trouble on Friday of last week, when it collided at Marlbrook, near Bromsgrove, with a furniture van. Both vehicles were badly injured, the motor-car sustaining damage to its engine, besides having its bonnet and lamps smashed. Repairs were effected at Bromsgrove, and the mails were taken on to Worcester after several hours' delay.

THE new repair works of Messrs. Panhard and Levassor at Acton Vale have separate departments for body repairs, wheelwrights' work, and magneto repairs. The company undertake repairs to cars of any make or type, and will continue the work of lengthening short chassis, so that they will take long, roomy, side-entrance bodies. Engines taken in for overhaul will be run and tested on the brake before being put back into the frame, and the large piece of ground set aside for future extensions is at present circled by a track on which cars can be tested.

## SOME REMARKS ON PRE-IGNITION.

THE treatment of the subject of pre-ignition leads into many channels. It is necessary to discuss the fouling of the combustion chamber, which is probably the most common cause of this annoying phenomena; improper cooling, due to numerous causes, each of which leads into a separate field of discussion; and compression and carburation. In fact, it may be said that pre-ignition is at present the limit placed upon internal combustion engine efficiency. There is a certain amount of heat, and only a small percentage of it can be utilised for power. And why? Because heat, as handled in the gas engine, is an unruly, unmanageable element. It cannot be confined or stored, or its intensity prolonged. It is generated instantly and departs instant. If there is an infinitesimally small crevice, it will blow through to the atmosphere; if there is a cold or cool cylinder wall, it will dodge work by shrinking to the original volume of the unexploded gas; if the gas is ignited between surfaces in too close proximity, combustion will lag and be incomplete at the opening of the exhaust, overheating the motor and outlet pipes; if the gas is too rich in fuel the same thing will happen, and if too rare it gives a slow burning mixture, which not only fails to produce power, but pops back into the inlet pipe and carburettor.

There is no settled rule in regard to the most advantageous compression—both low and high pressures have their advocates. In the more recent text-books 90 lbs. gauge is laid down as the limit for petrol motors. Beyond this pressure pre-ignition is supposed to appear and reduce the efficiency of the engine. Apparently pre-ignition is regularly present in some motors working under a full head of gas at high speed. With compression exceeding 90 lbs. gauge it is next to impossible to run on the slow speed without knocking. Observe one of these high compression motors. Watch the driver when the speed of the car drops below ten or twelve miles an hour; see the change-speed lever go a notch lower down. The speed of the motor must be maintained at a point where the inertia of the flywheel will overcome any back pressure, the result of pre-ignition. It is my theory, remarks a writer in the "Motor Age," that at 90 lbs. compression and a wide-open throttle a certain amount of pre-ignition will occur. It may not be noticeable at high speed; it probably is not, because the charge may necessarily be fired by the spark before pre-ignition occurs. Take the case of an overheated motor, which continues to fire after the current is switched off. It never runs at any great speed; its revolutions are slow. This demonstrates one of two things—either the cause for the self-ignition is not sufficiently energetic to lead to rapid propagation of the flame, or pre-ignition occurs later than the spark would fire the charge normally.

It is believed that the greatest harm coming from pre-ignition is from over-rich mixture. There is but one carburettor on a four-cylinder motor. Its proper adjustment would not be at all difficult provided the four cylinders were uniform. But how often is heard the assertion, even by makers, that "every multiple motor has its weak cylinders." What does it mean? It means that compression in all cylinders is not uniform. The irregularity may be occasioned by a difference in volume of clearance space; leaks around valves or rings, or lack of uniformity in the operation of the valves. Or irregular operation may result from faulty timing or coil adjustment, a difference in the space between the sparking plug points or leaky electrical connections, which cause one or more cylinders to fire out of time.

When these irregularities occur recourse is too often to the carburettor as the quickest and easiest remedy. There is a leak past the valve or rings in one cylinder, allowing a percentage of the gas to escape during compression. Lower compression requires richer mixture to fire, with the result that the weak cylinder does not fire. The motorist opens the throttle and gives all four cylinders more gas; the weak cylinder immediately begins firing and the operator considers his adjustment successful. But it is not. He has made his mixture right for the weak cylinder and wrong for the three normal ones. True they work,

but they do not develop their full power. Moreover, the mixture, being richer than is needed in the three good cylinders, will not stand the heat of compression. Pre-ignition is the result, evidenced in this case by knocking under full throttle at high speed. The majority of supposedly loose connecting rods may be remedied by overhauling the motor and securing even compression.

It is remarkable how cool a motor will run, even at the limit of compression, when all cylinders are perfectly tight. The fuel in the mixture can then be reduced to a minimum. When the proportion of petrol in the mixture is just right, combustion is complete; the gases burn, expand quickly, do their work, and when the exhaust valve opens leave no abnormal surplus to waste. It may be laid down as a rule that there is a fixed amount of heat in a quantity of liquid fuel. If properly mixed with air so that the time required for complete combustion is in proper relation to the piston speed of the motor, it will be economically employed; if the proportions of fuel and air are wrong, and the mixture so rich in petrol as to cause it to be so slow burning that it is not perfectly consumed by the time the

The "Patrie" Air Ship passing over the Grand Palais, Paris.

piston reaches the end of the stroke, then combustion continues out past the exhaust valves, and into the silencer, with consequent loss of both fuel and power. The average motorist does not realise the importance of perfect compression and regular firing. Without uniform compression the motor will never develop its maximum efficiency, nor will it ever run smoothly and sweetly. Either the weak cylinders will miss fire, or the normal ones will pre-ignite, knock and overheat.

THE Prosper Lambert Company, of Nanterre, France, is reported to have secured an order for 1,000 12-h.p. double-cylinder motor-cabs for service in Paris.

ACCORDING to "Answers," "ladies living in nice houses in the country, but with small incomes, have splendid opportunities now for making money by providing luncheons for motorists. The village inn does not satisfy the demand of car owners. Motoring makes them hungry, and what they want is a really good meal, well cooked and served. Ladies willing to cater for motorists should advertise in the journals devoted to motoring. They would find the venture a paying one."

## Some Swiss Cars at the Show.

Numerically Swiss motor-car builders made a much bolder display at the *Salon* than did British makers, among the vehicles represented being the Saurer, Orion, Stella, Lucia, Helios, Millo, and Turicum.

### The Turicum Voiturette.

One of the novelties in the voiturette section of the Show was the "Turicum" two-seated car exhibited by LA FABRIQUE D'AUTOMOBILES TURICUM, of Uster, Zurich. Two models are made, one fitted with a 6-7-h.p. single-cylinder engine, 110 mm. bore by 110 mm. stroke, and the other with 10-12-h.p. four-cylinder motor, 80 mm. by 80 mm. Both are air-cooled on novel lines; as will be seen from Fig. 47, the cylinder heads are surrounded by a horizontal chimney of aluminium, in the forward end of which is fixed a large fan, driven by a belt off the engine crank shaft. A similar arrangement is adopted in the single-cylinder motor, the makers stating that it gives excellent results in practice, they having had no cases of overheating even on the steepest hills. The transmission, too, is a departure from the usual practice, being by friction, a plan which has already

Fig. 47.—The Turicum 10-12-h.p. Four-Cylinder Air-Cooled Engine.

been adopted on the Maurer-Union, Frick, and Armadale cars. The engine shaft is extended to about the centre of the frame and carries on its end a large disc; at right angles to this is another disc free to be moved laterally on a cross shaft; the latter has a slight to and fro movement, so that when the position of the sliding disc has to be changed it can be brought out of contact with the fixed one. By means of the gear any desired speed between zero and maximum can be obtained, while when the sliding disc is brought over the centre of the other a reverse motion is obtained. The final drive is by a single side chain. The springs, again, are somewhat of a novelty, and consist of a long thin flat spring wound round several times so as to form a circle, which, when under loads, assumes an oval shape. The road wheels are of the artillery type with tubular steel spokes. The frame of the car is of wood and the ignition is by low tension magneto. As will be seen, the "Turicum" is certainly interesting from the point of view of novelty, and, so far as it goes, appears to be well made. Whether it is likely to give good results in practice on English roads can, however, only be verified by a practical trial.

### The Millo and Saurer Cars.

One of the most interesting of the Swiss exhibits was that of the SOCIÉTÉ DES AUTOMOBILES MILLO, Zurich, who are building both four and six-cylinder chain-driven vehicles. The chassis shown was a 40-50-h.p. four-cylinder, and was an excellent example of modern automobile construction. The cylinders are separately cast; dual ignition—magneto and accumulators—are

provided, while the fly-wheel fan is supplemented by one behind the radiator. The clutch is of the disc type, the change-speed gear is "gate" controlled, while a special point is in the simple means provided of adjusting the tension of the driving chains. The feature of the 30-35-h.p. car exhibited by M. ADOLPHE SAURER, of Arbon, is the system which enables the engine to be used as a brake, reference to which was made in our report of the 1905 Paris Show. In connection with the petrol supply,

Fig. 48.—Plan of the Turicum 6-7-h.p. Friction-Driven Car.

which is on the pressure-feed system, a small supplementary reservoir is provided on the dashboard, which always contains sufficient spirit to start the motor by gravity, so obviating the necessity of hand pumping.

### The Stella and Helios Cars.

The Stella car is made by LA COMPAGNIE DE L'INDUSTRIE ET MECANIQUE, of Secheron, Geneva, a characteristic feature being the simple design. The engine is a four-cylinder one of 14-18-h.p., having low-tension magneto ignition and a special form of automatic carburettor. The transmission is by a cardan shaft to a live axle. The frame is considerably narrowed in the front to give a very wide steering lock. It will be noted, too, from Fig. 49 that the headlight brackets are bolted to the front dumb irons. The SOCIÉTÉ DES AUTOMOBILES HELIOS, of Zurich, showed an 18-24-h.p. live axle car. The engine is of the four-cylinder type, the cylinders being cast in pairs with large water-jackets; the crank shaft, too, is *desaxe*. Low-tension magneto ignition is employed.

Fig. 49.—Plan of Chassis of Stella 14-18-h.p. Car.

### The Lucia and Martini Cars.

The Lucia car, which is made by Messrs. PICKER, MOCCAND AND CO., of Geneva, follows the standard lines of chain driven vehicles. The engine, which is of 24-30-h.p., comprises four cylinders with the valves all arranged on one side. Ignition is by high tension magneto, while the clutch is of the multiple disc type. The gear-box is placed well to the rear to give a short chain drive. The MARTINI AUTOMOBILE CO., LTD., of St. Blaise, had on view a new 14-22-h.p. car with live axle

and a 24-32-h.p. chain driven vehicle, very much on the lines of last year's model. We note, however, that a leather-faced cone clutch replaces the multiple disc one formerly fitted.

#### The Renault Cars.

For the 1907 season Messrs. RENAULT FRERES are building four models—8-9-h.p. double cylinder, 10-14-h.p., 20-30-h.p., and 35-45-h.p. four-cylinder. A view of the latter is given in

A new form of lubricator is provided, the sight feeds being adapted to give three rates of oil flow according to the adjustment; they cannot, however, be closed entirely as hitherto, so that so long as the engine is running a supply of lubricant to the bearings is ensured. The clutch is of the leather-faced cone type; it abuts against a flange connected with the flywheel, having a series of slits in the internal periphery. These slits

Fig. 50.—Chassis of Renault 35-45 h.p. Car.

Fig. 50. The 8-9-h.p. vehicle represents the type now being largely adopted in Paris and London for cab service. Referring to the four-cylinder models, we find that these are all provided with mechanically-operated valves. The ignition is by Simms Bosch high-tension magneto located at the front end of the engine. The automatic carburettor has been improved, a piston moving in a bath of spirit replacing the screw, which was found to occasionally stick. In the 10-14-h.p. car the throttle is controlled by a pedal, while in the other models the action of the latter is assisted by a pull-up and rotatable lever on a sleeve

act as springs, so that as the clutch is let in, the drive is taken up without any shock. The 10-14-h.p., 20-h.p., and 35-45-h.p. cars are all provided with a double-sleeve four-speed change-speed gear, driving through a cardan shaft on to a live axle. Half-compression devices operated by the left hand are fitted to the two larger cars to facilitate the starting of the engines. The suspension, except in the case of the 8-9-h.p. and 10-14-h.p. vehicles, is on new lines, the rear transverse spring having been abandoned in favour of three-quarter elliptic springs. In order not to interfere with the carriage body the rear shock absorbers,

Fig. 51.—Chassis of Leon Bollee Six-Cylinder Car.

surrounding the steering column. The sleeve in turn rotates a vertical rod through worm gearing inside a casing on the dashboard, the rod finally engaging, by means of an eccentric on its lower end, a projection on the throttle pedal. The radiator, which is located in front of the dashboard, consists of a large number of small vertical tubes, the circulation, as usual on Renault cars, being by thermo-siphon. Vanes are formed on the outer surface of the flywheel to act as an air-inducing fan.

fitted in conjunction with the springs, as also the brake rods, are now arranged inside the frame. Provision is also made whereby the brakes can be adjusted without the use of tools. The 10-14-h.p. car is provided with a new self-starting device, which consists of two opposed cylinders, mounted just below the front of the motor, and fitted with pistons, the rods of which are mounted in guides, and formed on one side as racks, which engage a pinion on the end of the crank-shaft. Compressed air

is admitted to each cylinder from a steel reservoir, the air having been pumped into the reservoir by a small plunger pump actuated by a crank and connecting rod on the front end of the motor cam-shaft.

#### The Leon Bollée Cars.

The LEON BOLLÉE COMPANY, of Le Mans (Sarthe), for whom the Victoria Carriage Works, Ltd., are the British agents,

Fig. 52.—The Leon Bollée 20-30-h.p. Four Cylinder Engine.

are turning out quite an extensive range of cars for 1907, viz., 16-24-h.p., 20-30-h.p., 30-45-h.p., and 45-50-h.p. four-cylinder, and 30-45-h.p. and 60-75-h.p. six-cylinder, one noteworthy feature being the considerably reduced prices at which they are being offered. The small car is quite a new model, it being the first Leon Bollée vehicle with a live axle; the 20-30-h.p. is made with either cardan shaft or chain transmission, while the others are all driven by side chains. As will be seen from the illustration of the 20-30-h.p. engine (Fig. 52), the cylinders are cast in pairs and have the valves arranged on each side. It will also be noticed that the valve stems, springs and tappets are enclosed by means of readily detachable aluminium covers, the parts not only being protected from dust, oil, and dirt, but any noise they emit is muffled, so adding to the silent running qualities of the vehicles. The standard ignition is by high-tension magneto, but provision is made for fitting accumulators as a reserve. The special type of double jet carburettor is retained, but has been modified in that one or both can be brought into action as required by means of a lever on the steering wheel. The method of controlling the engine speed is interesting; a *manette* on the steering wheel regulates the throttle in the usual way; secondly, the clutch pedal is so connected up that as the clutch is withdrawn the speed of the motor is automatically cut down; while, thirdly, the engine can be accelerated by a small pedal, even when the clutch is not engaged. An interesting feature of the engine lubrication system is an arrangement by means of which any excess of oil can be run off or the base chamber entirely emptied. The clutch, which is of the leather-faced cone pattern, is mounted in such a way that to a small extent it is free to float upon the clutch shaft, a special arrangement of springs permitting a gradual engagement. The main clutch spring is carried horizontally beneath the clutch-shaft. The four-speed change gear is controlled by a "gate" lever with a special locking arrangement for the gears not in mesh. Altogether the 1907 Leon Bollée cars have a pleasing appearance, they being free from unnecessary complication, as may be seen from Fig. 51, which gives a view of the new 30-45-h.p. six-cylinder vehicle.

#### The Darracq Cars.

Messrs. A. DARRACQ AND CO. had, as usual, a varied exhibit, ranging from a new 7-9-h.p. single-cylinder two-seater to a 20-28-h.p. vehicle, all having transmission by a cardan

shaft and bevel gear to a live axle. A feature of the new 7-9-h.p. and 8-10-h.p. vehicles is the frame, which is of special design, the sides being extended upwards to form part of the body. The valves are mechanically operated, and the carburettor is provided with an extra automatic air inlet. The change-speed gear gives three speeds forward and a reverse, with direct drive on top, controlled by a lever on the steering column. A 10-12-h.p. double-phaeton was also exhibited; this vehicle, which is fitted with a twin-cylinder engine 100 mm. by 120 mm. stroke, shows but few changes as regards the mechanical details. The frame has, however, been slightly increased in width to allow more room in the body. Passing to the new 20-28-h.p. car, several departures from the usual Darracq practice are embodied in this model. The four cylinders, which are cast in pairs, are 112 mm. bore by 120 mm. stroke, the valves being all operated off a single cam shaft. The ignition is by coil and accumulators, although the motor is so arranged that a low-tension magneto can be added if desired. The clutch is of the leather-faced cone type, four flat springs being introduced under the leather to ensure a better grip. A universally jointed shaft connects the clutch with the gear-box. The latter is adapted to give four speeds forward and a reverse, controlled by a lever working in a "gate," this being an entirely new feature in Darracq cars. The clutch pedal is so connected to the throttle that as the clutch is withdrawn the speed of the engine is automatically cut down, and it may be added that ball-bearings are fitted to all parts except the engine. A car of similar power, but fitted with only three speeds, controlled by a lever working in a quadrant of the Panhard type, is also being made. The great centre of attraction at the stand was, however, the new 40-h.p. six-cylinder car, the motor with which is illustrated in Fig. 53. The cylinders, which are cast in three pairs, are 100 mm. bore by 120 mm. stroke. Ignition is by high or low tension magneto, as desired, a reserve set by accumulators being also provided. Four speeds and a reverse are provided, the control being by means of a single lever working in a "gate." Ball bearings are used throughout, except on the engine. The usual trio of brakes are provided, these being of great power. The car is being built in two

Fig. 53.—The Darracq 40-h.p. Six-Cylinder Engine.

lengths, one having a wheel-base of 10 ft. and the other 10 ft. 8 in., to allow roomy side-entrance bodies to be fitted.

#### The Radia Cars.

LA SOCIÉTÉ L'AUTOMOTRICE gave pride of place at their stand to a chassis of the latest 30-35-h.p. Radia car, which compared well with any in the Salon. The vehicle is on the orthodox lines of chain-driven cars. The four-cylinder engine has the valves operated off two cam shafts, the gear driving the latter being enclosed. The ignition is by low tension magneto; the mixture is furnished by a special form of automatic car-

burette, provided with hand and foot controls, the centrifugal governor having been discarded. The power is conveyed through a special form of cone clutch to a gear-box giving four speeds and a reverse, the shaft between the clutch and the change-speed gear being provided with two universal joints. Four brakes are furnished, two on the differential shaft and one on each of the hubs of the rear wheels. The Radia Company are also building 12-14-h.p. and 20-22-h.p. four-cylinder cars on similar lines.

#### The Lutece Car.

M. R. GACHET, Paris, who is represented in England by Messrs. Teste and Lassen, exhibited a new car known as the "Lutece." The vehicle is of the live axle variety, and is fitted with a four-cylinder engine of 14-h.p., the details throughout being on modern lines.

#### The Rossel Cars.

In addition to four sizes of four-cylinder vehicles, Messrs. F. ROSSEL AND CO., of Sochaux near Montbéliard (Doubs), are building three models of six-cylinder cars for the 1907 season

Fig. 54.—The Rossel 30-40-h.p. Six-Cylinder Motor.

ranging from 30-40-h.p. to 60-80-h.p. We give an illustration of the 30-40-h.p. engine in Fig. 54, from which it will be seen that the cylinders (110 mm. bore by 110 mm. stroke) are cast in pairs with the valves arranged on opposite sides. The cam shaft driving gears are enclosed and located at the fly-wheel end of the engine, although in the 40-50-h.p. four-cylinder and 60-80-h.p. six-cylinder they are placed forward. The governor has been abandoned, the speed of the engine being controlled by hand and foot levers acting on the throttle. The transmission is through a multiple disc clutch of the Hele-Shaw type to a gate-controlled change-speed gear, and thence by side chains from the differential shaft. The engine lubrication is maintained by a pump, as is also the pressure in the petrol tank of the 40-50-h.p. four-cylinder vehicle, which is an entirely new model. A somewhat novel method of exhibiting a chassis was adopted by Messrs. Rossel, it being fastened to a wall with the engine at the bottom. The Rossel cars are of high grade construction and deserve to be better known in England.

#### The Cornilleau-Sainte-Beuve Car.

Although not a new-comer, one of the most interesting cars in the Show was the 20-30-h.p. vehicle exhibited by Messrs. CORNILLEAU AND SAINTE-BEUVE, now represented in England by Messrs. Straker and Squire, Ltd. The four cylinders of the engine are all in one casting; the valves are arranged on opposite sides, their springs and rods, as well as the low-tension magneto tappets, being entirely enclosed in extensions of the castings, access to the parts being through large detachable doors. Other features of the vehicle are—variable lift to both the inlet and exhaust valves; a change-speed gear in which the sliding

pinions are loose on the shaft until partly meshed with the fixed pinions, the completion of the meshing bringing dog clutches into action; and the live axle, which has a spring drive in the large bevel wheel. A very complete system of piping in the crank case for lubrication of the big ends of the bearings by pump feed is also among the many good points of this vehicle.

Fig. 55.—The Brillie Diligence.

#### The Brillie Cars.

In addition to industrial vehicles, LA SOCIÉTÉ DES AUTOMOBILES EUGÈNE BRILLIE is turning out some excellent examples of high-powered touring cars, one of which we illustrate in Fig. 55. The engine, which is of 35-45-h.p., comprises four separate cylinders with the valves all worked off a single cam shaft, the inlets being in the cylinder heads and actuated by tappets. A feature of the ignition, which is by high-tension magneto, is that it is automatically advanced and retarded. The inlet and exhaust pipes are also interesting, the main portions being cast in one with the cylinders, and connected together by short brass tubes. A water-jacket is also provided to the exhaust collecting chamber. The clutch is of the disc type and the transmission is by a cardan shaft to a special design of live axle.

#### The "Unic" Cars.

Messrs. GEORGES RICHARD AND CO., represented in England by Messrs. Mann and Overtons, Ltd., had a large stand, on which were shown several of the "Unic" 10-12-h.p. two-cylinder

Fig. 56.—The Unic 12-14-h.p. Four-Cylinder Motor-Cab.

12-14-h.p., and 16-20-h.p. four-cylinder cars, all having cardan shaft transmission and live axles. The 10-12-h.p. vehicle has already been described in the *M.C.J.*, and represents the type adopted by one of the leading motor-cab companies in London. The engine dimensions are slightly larger, but otherwise the alterations are confined to matters of detail. The great novelty on the stand was the chassis of the new "Unic" 12-14-h.p. four-

cylinder car, which has been specially designed for town use. The cylinders, which are 75 mm. bore by 110 mm. stroke, are all in one casting. The valves are mechanically actuated off a single cam shaft, the ignition is by high tension magneto, and the water circulation by pump and honeycomb radiator. The carburettor is located close to the explosion chambers, so that the length of the inlet piping is reduced to a minimum. A leather-faced cone clutch provided with a stop to facilitate changing gear is employed. The frame suspension is by three-

Fig. 57.—Plan of Chassis of Motobloc 16-22-h.p. Live Axle Car.

quarter elliptic springs. The four cylinders of the 16-20-h.p. are cast in pairs, and are 87 mm. bore by 110 mm. stroke. A good feature is the arrangement for automatically retarding the ignition when starting the engine. The vehicle is made in two models, the gear-box of one giving three forward speeds and the other four, in addition to the reverse. The Unic cars have earned an excellent reputation both for simplicity and reliability, which will doubtless be more than maintained by the 1907 models.

#### The Motobloc Cars.

LA SOCIÉTÉ DES AUTOMOBILES MOTOBLOC, of Bordeaux, are now building four models, all with four-cylinder vertical motors, viz., 16-22-h.p., 24-30-h.p., 30-40-h.p., and 60-h.p. The cylinders, although cast in pairs, are separate except as regards the water-jacketed portion. A feature of the engine is that the flywheel is located in the crank case between the two pairs of cylinders. The valves are all mechanically actuated off a single cam shaft, the inlets being located in the cylinder heads and operated by tappets and rocking lever. The latter are mounted on an eccentric rod controlled by a lever on the steering wheel. By revolving this rod the height of the rockers is raised or lowered and a variable lift imparted to the inlet valves. A special form of automatic carburettor furnishes the mixture, and the ignition is by Nilmeliore high-tension magneto; the latter is placed directly under the footboard, being carried on a bracket cast on the gear-box, and driven by a jointed shaft. A notable point in the Motobloc system, from whence the name is derived, lies in the fact that the engine and change-speed gear form practically one block, the crank chamber being extended to form the gear-box. The clutch is of the metal-to-metal type, and the pedal which operates it is so connected up to the carburettor that as the clutch is withdrawn the speed of the engine is automatically cut down. All the cars over 24-h.p. are provided with "gate" controlled change-speed gear, a special locking arrangement securing the selector rods not in operation. The 16-22-h.p. car (Fig. 57) is made with either a live axle or side chain transmission, the others all being chain driven. We understand that a new company is being formed to introduce these cars into England on a larger scale than hitherto.

#### The Imperial Car.

A new car hailing from Belgium is the Imperial, made by M. A. G. PIEDBOEUF, of Liege, who showed a 24-30-h.p. vehicle. The four-cylinder engine (110 mm. bore by 130 mm. stroke) has interchangeable valves ranged on one side. Ignition is by magneto, accumulators being also provided as a reserve. The carburettor is of the firm's own automatic design, and the clutch, which is of the multiple disc type, is so arranged that when it is disengaged the speed of the engine is automatically cut down. The change-speed gear is of the "gate" controlled pattern, with direct drive on top speed through the cardan shaft and bevel gear to the rear live axle.

#### The Rene Legros Two-Cycle Engine Cars.

M. RENE LEGROS, of Fecamp (Seine Inferieure), who has long devoted attention to the perfection of the two-cycle engine, in which an explosion takes place in each cylinder at each revolution of the crank shaft, and to whom belongs the credit of running the first vehicle fitted with such a motor in a long reliability trial, exhibited an interesting 30-h.p. four-cylinder car. In the two-cycle engine the base chamber is usually employed as a receptacle for the incoming charge. M. Legros, however, uses a very long hollow piston surrounding a smaller fixed piston. In place of a central connecting rod two are furnished to each cylinder, one on either side, thereby allowing for the fixed piston. A feature of the arrangement is the provision of a rotary valve, which acts both as an inlet and for the transfer of the mixture from the compression space to the combustion chamber. As the hollow piston rises a charge of mixture is drawn through this valve and along a passage into the compression space formed between the two pistons. On the descent of the hollow piston this charge is delivered through the rotary valve to the induction pipe and into the combustion chamber through the usual automatic valve. On the compression stroke the space between the two pistons is again charging itself with mixture from the carburettor, and upon the explosion stroke a fresh charge enters at the top of the cylinder, the burnt products being forced out at two ports in the lower end of the cylinder walls, uncovered by the travel of the piston towards the end of its stroke. The ignition is somewhat novel, two magnetos being provided, one for each pair of cylinders. As regards the transmission, this is through a Hele-Shaw disc clutch and cardan shaft and bevel gear on to a live axle, a special form of universal joint being used.

#### The Scar Car.

LA SOCIÉTÉ DE CONSTRUCTIONS DE AUTOMOBILES DE RHEIMS (Rayet, Lienart and Co.), Witry-les-Rheims, represented in this country by the Central Motor Car Company, Ltd., exhibited the 18-20-h.p. Scar car, the main features of which have already been dealt with in the *M.C.J.* It may be mentioned, however, that the engine, which is rated at 18-20-h.p., has four separately-cast cylinders, 90 mm. bore by 100 mm. stroke. The valves are mechanically actuated off separate cam shafts, the inlets being provided with a variable lift obtained by means of wedges sliding between the cams and the valve push

Fig. 58.—Section of Scar 18-20-h.p. Motor.

rods, and controlled by a lever working on a fixed sector above the steering wheel. The ignition is by means of a gear-driven high-tension magneto, while the water circulation is on the thermosyphon principle, no pump being employed. The radiator is of the framed ribbed-tube type, a current of air being drawn through the same by means of a fan, which, as will be seen from Fig. 58, is not belt-driven as usual, but is operated off the crankshaft through bevel gearing. The clutch is of the leather-faced cone type. The operating spring does not surround the clutch shaft, but is located to one side in such a position that its tension can

be readily adjusted. From the clutch the power is transmitted by a short jointed shaft to the gear-box, and thence by a cardan shaft and bevel gear to the rear live axle. Three speeds and a reverse, with direct drive on the top speed, are controlled by a single lever. It may also be mentioned that the crankshaft is of the built-up type.

#### The Peugeot Cars.

The 1907 productions of the PEUGEOT Co. include 9-h.p. single-cylinder live axle, 10-12-h.p. double cylinder chain trans-

Fig. 59.—Details of New Radius Rods and Chain Adjustment on Peugeot Cars.

mission, 12-h.p. four-cylinder driven by chains or cardan shaft, and 18-h.p., 28-h.p., and 50-h.p. four-cylinder, with side chains. Compared with last year, the smaller cars show little change. In the larger vehicles, however, there are a number of modifications, which Mr. C. Friiswell, the British agent, pointed out to us. The motors have the four cylinders cast in two pairs, and all the valves mechanically actuated, the inlets being on one side and the exhausts on the other. Low-tension magneto ignition is employed, provision being made for fitting the high-tension system by coil and accumulators as a reserve. Attention may also be drawn to the fact that the magneto, which is gear driven, is so arranged that it may instantly be removed from its place whenever necessary. The oil reservoir has been removed from the dashboard, and the engine crank-case is now served with oil periodically by a foot pump, which is situated just in front of the driver's seat, in such a position that it can conveniently be operated by the heel of the right foot. The familiar type of square bonnet has, we notice, been changed to one of more graceful design. On the 50-h.p. car the clutch is of the metal-to-metal type, a single segment passing three-quarters of the way round the inside of a drum in the flywheel. One end of the segment is fixed, and the other is made to open outwards by means of a compensated lever. On the other vehicles a leather-faced cone-clutch is employed, this being disengaged by the pressure of two ball-bearing rollers upon a collar, the arrangement being such that when the clutch is engaged there is no contact between the actuating mechanism and the clutch shaft. The shaft which connects the clutch with the gear-box is so constructed as to compensate itself to any want of alignment between the two parts. The change-speed gear is adapted to give four speeds forward and a reverse, the single controlling lever working in a "gate." The gear-box is separate from the differential shaft, which latter is placed well to the rear to permit of a short chain drive. All the brakes are of the internal-expanding metal-to-metal type, that on the cross shaft being enclosed in the differential case. The clutch and brake pedals are of new design, with provision for adjustment to suit different drivers. Special attention may be drawn to the improved method of adjusting the tension of the driving chains, which is now effected from the rear of the chassis. Fixed to the brake drums *h* at the rear are specially-shaped radius rods *i*; two collars *k* and *l* are provided on the latter, that at the rear being split and tapped, as shown in section in the bottom left hand portion of Fig. 59. The second main component of the arrange-

ment is a rod *m*, which carries at its forward end an eye-piece, *n*, free to move round the bearing *j* of the differential shaft *d*. The front end of the rod is free to slide in the collar *k*; at the other extremity it is carried in an externally-threaded sleeve *o*. To adjust the chain tension, the bolts *r* and *s*, which not only hold the two parts of the collar together but the latter to the radius rod *i*, are slackened. By means of a spanner or wrench the specially-shaped end *t*, on the sleeve *o*, can be turned, drawing with it the rod *m*, by means of the shoulder *p* and the nut *q*, the distance between the differential shaft *b* and the rear axle *d* being thus altered. While the rod, *m*, maintains the chain at an equal tension—it being free to rotate in the collars *k* *l*—it can follow any movement of the rear axle due to bad roads. The new arrangement not only considerably facilitates the work of tightening the driving chains, but also permits of the latter being provided with a gear case, the adjusting device remaining unenclosed.

#### The Astahl Cars.

LA SOCIETE L'ECLAIR showed an interesting series of moderate priced cars known as the Astahl, the London agency for which has been secured by the Century Motor Company, of Willesden. The 6-h.p. and 8-h.p. models are fitted with De Dion engines, while the 10-12-h.p. is provided with a four-cylinder motor, all in one casting. The water circulation is either by pump or on the thermo-syphon system as desired. A high tension magneto is provided on the large car, as is also a Grouvelle-Arquembourg carburettor. The transmission is through a cone-clutch, three speed-gear box and cardan shaft to a live axle. Ball bearings are used throughout, except on the engine, while a noticeable and useful feature is that the engine, clutch, and gear-box and differential are so arranged that each can be dismounted independently without interfering with the other parts.

#### The De La Buire Cars.

LA SOCIETE DES AUTOMOBILES DE LA BUIRE, of Lyons, are now turning out three models of four-cylinder vehicles, 15-h.p., 24-h.p., and 35-h.p., as well as a six-cylinder vehicle of 50-h.p., all having live axes. The engine has the four cylinders cast in pairs, with the valves on opposite sides. A special form of automatic carburettor is employed, this being so arranged that the petrol supply can be entirely cut off and cold air admitted direct to the cylinders. The ignition is by high-tension magneto. The clutch is of the expanding metal band type; two diagrammatic views of it are given in Fig. 60, from which it will be

Fig. 60.—Front and Transverse Sectional Views of De la Buire Metal-to-Metal Clutch.

seen that the ends of the band are attached to two arms 6 and 9 pivoted below at 8. Carried on a sleeve on the clutch shaft are two specially-shaped wedge pieces 10 and 13, these being so designed that as the pedal is released the wedge 10 is interposed between the upper part and opens the arms 6 and 9, and consequently expands the band. To declutch the pedal is depressed, bringing the thick portion of the wedge 13 between the lower

portion of the arms, and so contracting and freeing the band from the flywheel. The 15-h.p. and 50-h.p. have three and the 24-h.p. and 35-h.p. four forward speeds and a reverse, with direct drive on top speed, controlled by a lever working in a "gate."

#### Some Small French Cars.

A noticeable feature of the *Salon* this year was the large number of small cars on view, many of which are fitted with a new four-cylinder engine having the cylinders all in one casting. The Alcyon, Werner, Reyrol, Mistral, and Zedel vehicles have already been referred to, while others which may be mentioned are

Fig. 61.—Elevation and Plan of the Bailleau Light Car.

the Eureka, the Mira, the Demeester, the Chameroy, and the Delage. A neat little two-seated car was shown by LA SOCIÉTÉ AUTOMOBILES "OREL," of Argenteuil, France. The car is chain-driven and is provided with a two-cylinder engine, 84 mm. bore by 100 mm. stroke, rated at 8-9-h.p. Three speeds and a reverse are controlled by a single lever, the drive on top speed being direct. Ample brake power is provided, and with wheel control, push pedals, and other up-to-date fittings the car should meet the requirements of a large number of those looking for a little runabout at a moderate price. A 10-12-h.p. car with all four cylinders in one casting is also being made by the Orel Co. A single-cylinder two-seated car, on novel lines, was displayed by M. MOUILLESEUX-TARRISSE, of Suresnes, the feature lying in the friction drive, which is arranged on different lines than hitherto, being on the back axle. The cardan shaft, instead of terminating in a bevel pinion, carries on its rear end a flat disc in contact with a corresponding one mounted at right angles on the left portion of the axle. No differential is employed although the axle is in two halves, a special spring arrangement being provided to allow one portion to slightly over-run the other. By altering the position of the sliding disc on the axle any desired speed between zero and the maximum can be attained. The car is, undoubtedly, a simple one, and as a little runabout will no doubt give good results.

#### The Bailleau Car.

M. BAILLEAU, of Longjumeau, who has devoted considerable attention to the construction of light cars, shows a small 8-h.p. single-cylinder vehicle (Fig. 61) which is supplied either as a two-seater or with a tonneau body. The frame is of pressed steel construction, and is supported on the axles by the usual longitudinal springs, a transverse one at the rear being also provided. The water circulation is on the thermo-siphon system, the radiator, which is provided with a fan, being located in front of the dashboard, as in the Renault cars. The gear-box is adapted to give three speeds and a reverse, with direct drive on

the top speed to the rear live axle by means of a cardan shaft and bevel gear. Ball bearings are used in the gear-box and on the back axle, and, with metal-to-metal brakes and other adjuncts of large vehicles, the little car should appeal to a large clientele. M. Bailleau is also making a 6-9-h.p. twin-cylinder car and a larger vehicle with a 16-h.p. four-cylinder engine.

#### The Parant Car.

In one of the side galleries an interesting car was shown by Messrs. PARANT FRÈRES, of Neuilly, the steering-gear, clutch and change-speed gear all being of a special design. The chassis on view was of 24-30-h.p., and had side-chain transmission. As regards the clutch, this is of the metal-to-metal type, and comprises a disc held by, but free to move slightly in the fly-wheel, and gripped when engaged by shoes, which are expanded by wedge-shaped pieces controlled by the clutch pedal. The change-speed gear is of the type in which the pinions are always in mesh, the feature being that the gear wheels on both shafts run loosely. The bosses of the same are provided with a series of internally-cut teeth in which correspondingly-shaped sliding members on the two shafts engage, the power being transmitted by the pair of pinions, which become fixed, according to the position of the change-speed lever. On the top speed the drive is direct, none of the pinions, although in mesh, rotating.

#### The Sizaire-Naudin Light Car.

The Sizaire-Naudin two-seated car, which was introduced a year ago, continues to attract considerable attention, interest in the novel vehicle being increased by reason of its excellent performances in the recent voiturette trials in France. Beyond the fact that the frame is now of armoured wood, and that the engine is of slightly higher power, little or no change has been made, and as we gave a very full description of the machine about twelve months ago, we need only refer to the principal features. The two side members are not connected together at the rear, but are provided with stay rods about the centre of the frame, and at the front end are attached to a cross steel bridge, on a projection from which a semi-elliptic spring is supported, as shown in Fig. 63. It will be seen from the latter that the usual front axle and side springs are done away with, the cross bridge terminating in vertical sleeves in which the pivots of the steering wheels are not only free to turn in the usual way, but also to rise and fall against the action of the spring. The rear suspension is also on novel lines, the axle being connected to a point slightly behind the centre of the frame by bow-shaped plate springs. The motive power is supplied by a single-cylinder engine developing 8-h.p. at 1,200 revolutions per minute. The carburettor is of the automatic air-regulation variety, while the advance and retard of the ignition is automatically varied by means of a small centrifugal governor. The water circulation is on the thermo-siphon system, no pump being used. With the

Fig. 62.—Sectional Plan of Sizaire-Naudin Change Speed Gear.

exception of a short one from the contact maker, there are no ignition wires about the car, the proximity of the motor to the coil enabling the connection between the latter and the sparking plug to be made by means of a spring piece. The clutch is of a special metal-to-metal type, and consists simply of a flat disc which fits close up to and against the inner face of the flywheel. The transmission is another feature of the vehicle; no gear-box,

in the usual sense of the term, is employed, a cardan shaft conveying the power to the rear live axle. The gear (Fig. 62), which gives three speeds forward—all direct—and a reverse, is all contained in the differential casing. The cardan shaft has on its end three pinions, the largest of which is only 4 in. diameter and the smallest 35 mm., or less than 1½ in., any of which can be brought into mesh by a cam device with the large crown wheel. The teeth of the latter are of special shape, the whole

Fig. 63.—Front View of Chassis of Sizaire-Naudin Car.

forming rather a circular rack than a gear wheel surrounding the differential gear. The cardan shaft is so arranged that it moves laterally to a sufficient extent to allow for the variation in diameter of the three pinions. The vehicle is made by LES ETABLISSEMENTS SIZAIRE ET NAUDIN, for whom Messrs. Gauthier and Co. are now the British agents.

#### The Civelli de Bosch Car.

The UNIVERSAL MOTOR COMPANY, LTD., of Billancourt, Paris, had on view a neatly designed 8-10-h.p. car named after the managing director of this new company. The engine is a double-cylinder one with Simms-Bosch high tension magneto. The transmission is by a cardan shaft to a live axle, the characteristic feature of the vehicle being the location of the three-speed change-gear immediately forward of the differential casing. A transverse spring is fitted to the rear of the frame, which latter is of pressed steel. Altogether the new car forms an interesting addition to the growing list of vehicles for motorists of moderate means.

#### The Clement-Bayard Cars.

The 1907 models of the CLEMENT-BAYARD Co., of Levallois, comprise 8-10-h.p. and 10-12-h.p. two-cylinder, and 10-14-h.p., 12-16-h.p., 14-18-h.p., 18-24-h.p., 20-24-h.p., 24-30-h.p., 35-45-h.p., and 50-60-h.p. four-cylinder. The 12-16-h.p., 18-24-h.p., and the three most powerful cars are chain driven, while the others have live axles. The vehicles, well known for their reliability, are all on modern lines, the larger models having multiple-disc clutches and gate controlled speed-gear. Perhaps the most interesting of the cars on view was the new 10-14-h.p. car which has been introduced to meet the demand for a four-cylinder car at a moderate price, and which comprises a number of special features. In the first place the four cylinders (75 mm. bore by 90 mm. stroke) are all made in a single casting, which forms at the same time the top half of the crank-chamber; the bottom half is in one piece with the gear-box, which is adapted to give three speeds and a reverse. This construction greatly simplifies the work of erection and, consequently, the cost of production. The water circulation is on the thermo-siphon principle, no pump being employed. The radiator is mounted in front of the dashboard, as in the Renault cars, a friction-

driven air-inducing fan being also provided. All the valves are mechanically actuated, while ignition is by high tension magnetic. The final transmission is by a cardan shaft and bevel gear to a live axle. The rear suspension of the frame is on somewhat novel lines; the rear side springs are supported by dumb irons in the usual way, but, instead of being anchored to brackets on the frame at the forward end, are shackled to halves of transverse semi-elliptic springs supported on a cross member. We also note that the steering and control gear is all arranged for the driver to sit on the left instead of on the right.

#### The Antoinette Car.

One of the most novel exhibits in the *Salon* was that of LA SOCIÉTÉ "ANTOINETTE," of Puteaux (Seine). In the first place we may refer to a 360-h.p. twenty-four-cylinder engine, which is of the V design, a dozen cylinders, in groups of four, being arranged on each side of the crank shaft. The engine, which is designed for marine use, only weighs between 11 and 12 cwt., or about 3-2-3 lb. per horse-power. From a motoring point of view interest was chiefly centred in a 32-h.p. eight-cylinder chassis, the engine being on the lines of that exhibited by the Adams Manufacturing Company at the recent Olympia Show. The transmission is on exceedingly novel lines, obviating, as it does, the use of a clutch, change-speed gear or differential, the function of which is performed by two hydraulic clutches—one at each end of a cross shaft towards the rear of the frame. The shaft is driven by a cardan shaft and bevel gear off the engine, and in turn is connected with the rear road wheels by side chains. The clutches are controlled by valves and a sliding screw by means of which any desired amount of slip can be allowed to take place, and the speed of the car varied from zero to the maximum by means either of a pedal or side lever, which act simultaneously on both valves. The latter are also so connected up with the steering gear that they can be actuated separately to give the necessary difference in speed when turning corners, so obtaining the action usually afforded by the differential. The reverse is obtained by means of a small gear-box located in the position usually assigned to the clutch, and containing a pair of pinions providing forward and backward motion by the engagement of jaw clutches.

#### The Robinet Tandem Voiturette.

A somewhat novel two-seated four-wheel vehicle (Fig. 64) was shown by Messrs. F. ROBINET AND CO., of Nantes. The

Fig. 64.—The Robinet Tandem Voiturette.

motive power is supplied by a Deckert 10-h.p. two-cylinder V engine, which together with the radiator is located in the centre of a long narrow wooden frame with a seat fore and aft. The transmission is by chain, two speeds being provided by a Boz'ier gear. The vehicle weighs complete less than 6 cwt., and should be a speedy little machine.

(To be concluded.)

COMPLAINTS of motorists driving through Bromley (Kent) at too great a speed seem to be well founded, and we support the Kent A.C. in suggesting a moderation of pace through that district.

IT is reported that a Nonconformist place of worship at Horsted, Keynes, Sussex, is being built with a garage for the convenience of those of its members owning motor-cars.

FROM the Daimler Motor Company, Ltd., comes a copy of the "Daimler Instruction Book," which should prove indispensable to owners and drivers of Daimler cars, as it contains in a very small compass a series of valuable hints, by following which the cars can be kept *au point*.

IN connection with the motor public service that is now succeeding so well at Osaka (Japan), several automobiles making daily runs of 100 miles, we learn that the Swinehart solid tyres are being employed. The rear tyres on one machine stood 17,000 miles of wear before requiring to be replaced—and that in public service.

SOME excitement was caused at Paris *Salon* on Tuesday last week when it was reported that the first of the new Mercedes 70-h.p. six-cylinder cars had arrived. The vehicle, however, proved to be one of the special racing cars built for the 1906 races, but which were eventually replaced by four-cylinder vehicles, and not a "six" touring car.

THE "Peel" motor companion is a neat leather pocket case with compartments for licences, cards, &c., brought out by Messrs. T. De La Rue and Co., whose "Bexhill" motor companion is another similarly good pocket case with various compartments for cutlery and fountain pens, scent bottles, &c., in addition to the usual fittings of such a compendium.

THE Earlsfort Terrace Rink, in Dublin, extended its reputation during the Irish Fortnight of 1903, when it was an important rendezvous for motoring visitors. At length its permanent acquisition for automobile purposes has taken place, having been secured by the Dublin Auto-car Company, which will have little difficulty in adapting the premises to the purposes of a motor garage and workshop.

A NEW list for 1907 has been issued by the Shrewsbury and Challiner Tyre Company, Ltd. In addition to the tyres recently referred to in our columns, full particulars are given of the motor sundries, &c., for which the firm act as wholesale factors. These include lamps, horns, jacks, plugs, pressure indicators, &c., and a full list will be sent on application, headquarters at Ardwick Green, Manchester.

IGNITIALITIES is the title of the new catalogue of the Electric Ignition Company, Ltd., of Sparkbrook, Birmingham. Among the specialities described and illustrated is the E.I.C. sparking plug, the success of which is due to the patent taper construction and the double insulator which makes a short circuit through the mica impossible, and other good devices of a similar kind. Coils, charging sets, switches, contact breakers, &c., find illustration in this excellent catalogue.

MOTORISTS who live in London will find the new two miles to the inch Ordnance Survey map of St. Albans of great assistance. Another most useful map which is just being issued has Andover for its centre. It is on the same scale, and takes in the country between Salisbury on the south, Lambourne on the north, Devizes on the west and Reading on the east, including the district known to the police as "Hand-over." Mr. T. Fisher Unwin is the present publisher of the Ordnance Survey maps.

THE Surrey County Council have discussed the motor-car problem on a report from the Highways Committee approving generally of resolutions from the County Councils of Cheshire and Westmorland as to motor-cars on public highways. Sir W. Chance objected to cars going at express speed, while Mr. S. J. Du Cros said that the Ripley road was fast becoming a motor track, and that the dust was a greater nuisance than ever. In the end the report of the committee was referred back for further consideration.

ACCORDING to a cable received last week from Melbourne a Coventry Humber car secured first place in the Victoria Automobile Club Trials with a consumption test of seventy-six miles on two gallons of petrol.

THE Rex Motor Manufacturing Company, Ltd., of Coventry, have sent us a copy of the new catalogue they have just issued, giving full particulars and illustrations of the 9-h.p. Airex twin cylinder side-entrance car they have recently introduced.

A NEW company is, we hear, being formed to be known as Colin Defries, Ltd., which will shortly open showrooms in the West End of London for the sale of Porthos cars, the sole British agency for which has been acquired by Mr. Colin Defries.

THE accompanying illustration shows Mr. and Mrs. Charles J. Glidden starting on another stage of their journey from Boston to Mexico city on their Napier car. The party left Boston on November 1, and drove by road to New York, Philadelphia, Baltimore, and Washington, where Mr. Glidden received from President Roosevelt a message of greeting to be conveyed to President Diaz of Mexico by automobile. The car was driven back to New York by road and on to Albany,

Buffalo, Cleveland, and Chicago, thus making a total of 35,357 miles which Mr. Glidden has travelled on the same vehicle on which he started his long trip. The photograph from which the picture was reproduced was taken on the 22nd ult., after the car had had steel-rimmed railway wheels substituted for the road wheels and the steering locked by means of a cross-bar. The schedule on the rail was made up for an average of twenty-five miles an hour and from 200 to 250 miles daily, no driving being done at night. The car will be driven under the control of a railway conductor, and will be treated as a special train by the operating department and train despatchers. Mr. S. F. Edge informs us that he has since received a cable from Mr. Glidden despatched from Alamogordo, in Texas, about 1,500 miles from Chicago, and stating that up to that point the drive had been in every way successful, although the journey had included the climb up a mountain rising 9,000 feet in twenty-two miles.

A FIRE has occurred at the Empire Motor Garage, Burton Street, Nottingham.

MR. R. T. LANG sends us a neat office calendar—a capital reminder that his office is at 27, Chancery Lane, W.C.

THE next quarterly trial of the Auto-Cycle Club will be held on the 26th prox., starting from the Chequers Hotel, Uxbridge.

The 12-15-h.p. Arrol-Johnston Double Landulet built for Mrs. Camille Courage, of Ascot.

WE hear that Messrs. C. Friswell, Ltd., have secured the sole selling agency for the six-cylinder cars built by the Standard Motor Company, Ltd., Coventry.

THE car presented by Madame Melba to her son, Mr. G. N. Armstrong, on the occasion of his marriage to Miss Ruby Otway last week, was a 14-23-h.p. Mors, fitted with a luxurious body.

THE High Tension Company have removed from Hanway Street, W., to larger premises in Addington Square, Camberwell, S.E., where they will also undertake repair work and have facilities for garaging sixty cars.

THE Clayton Parish Council has petitioned the chief constable of East Sussex to prohibit motor-bicycle races on Sunday at Clayton Hill, on the Brighton Road. A councillor stated that it was almost impossible to hear anything in Clayton Church because of the noise made by the motor-bicycles.

AT the distribution of prizes in connection with Pembroke Technical Schools, Ringsend, Dublin, Sir William G. D. Goff, on behalf of the Irish A.C., said that that organisation would do what it could to obtain employment for those who obtained the Club certificates after passing through the course of instruction at the schools.

A PROMINENT French manufacturer of motor-cars bought an Adams-Hewitt light car for his own use at the late show at Olympia, on the understanding that if the vehicle proved satisfactory he would purchase eight more for selling purposes, as he manufactured heavy machines only. An order for the remaining eight has just been received by the Adams' Manufacturing Co., Ltd., who are to be congratulated on the success of their vehicle in such a stronghold of the automobile as France.

SIR JOSEPH CAUSTON AND SONS, LTD., issue blotting pads and diaries of quality and utility beyond the ordinary range of such publications. The "Mercantile" pattern is a good one, with diary, date remembrancer, and a pad for memoranda combined with the usual thickness of blotting leaves. Folding over when not in use, it should provide a useful addition to the equipment of the busy man's desk. The "Universal," "Legal," and "Commercial" are other diaries associated with Messrs. Causton and Sons' name in which the convenience of the user has been carefully considered.

IN Peter Street, Manchester, Mr. T. Garner has a large motor-car depot.

MR. LESLIE BUCKNALL proposes to make a balloon trip to Russia.

THE Gillingham (Kent) local authorities are providing a motor car for the use of their surveyor.

THE King of Portugal has just placed an order for a Peugeot car, making the fifth he has had of this make.

MONDAY next is the latest date for entries for the A.C.G.B.I.'s side-slip trials.

SEVERAL of the leading motor-bus concerns have adopted the Peter Union tyres.

LORD BATTERSEA has ordered a 40-h.p. six-cylinder Napier of the latest type.

WE are informed by Brooke Motors (London), Ltd., that the Hon. E. A. Guinness has placed an order for a second Brooke car.

AT Spalding a new garage with inspection pit and other adjuncts has been erected by Mr. A. Beales, who has been appointed local repairer to the leading automobile organisation.

THE Surveyor to the Ongar Rural District Council is thinking of utilising the motor-cycle for the more rapid performance of his official duties.

A NOTICEABLE feature of the Paris Salon was that the gear boxes of many of the chassis on view bore the Renault licence plate. It will be remembered that Messrs. Renault Frères claim the master patent for the direct drive, and that a number of the leading concerns in France agreed to pay a royalty—hence the plate in question. Although the validity of the patent in this country has not yet been established, there is an action pending.

THE Metallic Manufacturing Co., Ltd., of Ardrossan, have issued a list of their "Halax" motor-car washers and ignition plugs. The corrugated metallic joints are filled with the firm's oxeloid manganite paste, while vulcanised fibre and asbestos millboard joints are also illustrated in the catalogue. In their plugs only chemically pure mica, free of all traces of metallic oxides, is employed, so that perfect insulation is obtained.

WE illustrate herewith one of the latest productions of Reo Motors, Ltd., of Broad Sanctuary, Westminster—a 16-20-h.p. landulet, with extension over the driver's front

The Reo 16-20-h.p. Landulet.

glass. The vehicle, which is excellently finished, having regard to its moderate price, is provided with a horizontal double opposed motor, a planetary type of change speed gear giving two forward speeds and a reverse, and final transmission by a single chain.

## CONTINENTAL NOTES.

### Public Services in Germany.

Arrangements are in hand to inaugurate a public service of motor-cars between Peledorf and Spindelmühl. A company has also just been formed at Briesach to establish a public motor-car service between that town and Schellstadt.

### Military Motor-Cars for Bulgaria.

A deputation of the Bulgarian military authorities recently visited Vienna to inspect the various motor-vehicles employed in the Austrian army. Visits were also paid to the works of several manufacturers of vehicles suited for use in connection with military purposes.

### The Scheveningen Motor Week.

It is again proposed to hold a motor week at Scheveningen (Holland) in June next. The programme will include a flower fete, a series of standing kilometre speed trials for touring cars, and a tour to places of interest in the district.

double pistons. The vehicle is to be driven by Mr. Colin Defries, the British concessionaire for the Porthos cars.

### The Touring Car Race for the Kaiser's Prize.

Up to Saturday last sixteen entries had been received for the touring car race for the Kaiser's prize to be held in Germany in June next. They include three Fiats, three Opels, three Benz, three Metallurgiques, three British Daimlers, and a Mors. The entry list closes on the 31st inst.

### The Trial of Engine-starting Appliances.

The trial of self-starting devices for petrol motors, organised by the Académie des Sports (Paris), and for which fourteen entries were received, has resulted in the first place being taken by the Lecomte apparatus, the Delahaye being second, Saurer third, Erlatti-Bossut fourth, and Lemasle fifth.

### The A.C.F. 1907 Grand Prix Race.

Much discussion has taken place over the 1907 race for the A.C.F. Grand Prix owing to one of the Parisian dailies publishing a report that the contest would not be sanctioned by the

From a Sketch in]

Passing Motorists to man in the tree: "Do you want any help?"

[L'Omnia.

### Sanitation and Motor-Cars.

The General Council of the Seine has decided on the establishment of five disinfecting stations on the outskirts of Paris. In connection with the same several special motor-cars are to be purchased for the rapid conveyance of clothing, bedding, &c., requiring disinfection.

### A Race Meeting at Calais.

The Calais section of the Automobile Club du Nord de la France proposes to organise a motor race meeting near Calais at the conclusion of the Ostend week next year. It is intended to hold a series of flying kilometre speed trials on the level, and also a hill-climbing competition over the same distance, but from a standing start.

### A 180-h.p. Racing Car.

We understand that the Porthos Company, which made its debut at the recent Paris Salon, is building a special six-cylinder racing car for next year's event. The engine will develop no less than 180-h.p., the six cylinders having

Government. The French Club at its last meeting decided to settle the question by sending a deputation to M. C'émenceau, the Minister of the Interior, to obtain his consent to the race.

### Miscellaneous Items.

The Dutch annual automobile exhibition is to be held in Amsterdam, from the 15th to the 24th February next.—The Automobile Club du Grand Duché de Luxembourg is being formed at Luxembourg.—The Motobloc Company are building six special racing cars for next year's events.—Following the example set by British manufacturers during the Olympia Show, quite a number of trade dinners were held in Paris during the past week. Among the firms there entertaining their friends were Peugeot, De Dietrich, Motobloc, Darracq, &c.

THE Prince's Road Garage has been opened at 137A, Upper Hill Street, Liverpool, by White's Carriage Company, Ltd., who have appointed a skilled engineer to take charge of the repair department. Cars will also be received at any of the company's various branches in Liverpool for storage.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices, 87-88, Charing Cross Road, W.C.]

### ROAD IMPROVEMENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No one will deny the public spirit of Mr. Evan Jenne and those associated with him in the effort to improve the road communication in the Lynton and Lynmouth district, but the matter is of too national importance to be dismissed by private generosity. Nor can it be deemed as merely within the province of the local authorities. We motorists are in the habit of seeing more of the country than the ordinary person, and can, therefore, take a wider view than most people. Hence the demand which has been so well voiced by the Hon. Arthur Stanley and others for a central road authority to maintain existing roads and suggest new ones.

This latter aspect of their work is perhaps the most important that can be tackled. By means of the motor-car economy of time is secured in getting from place to place. This is

my views, I would point out that in the present state of things such improvements will never be made unless private enterprise sets the pace.  
—Yours truly,

DEVONIAN.

### FOUR v. SIX CYLINDER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is an interesting discussion going on at the present moment in your journal between Mr. Edge and Mr. Jarrott. I presume you do not wish to confine the discussion to the above-mentioned two gentlemen. Is it not always a question as to what you are selling whether a thing is the best or not? For it must be apparent to everyone that Mr. Edge must talk all he can about six cylinders and Mr. Jarrott four cylinders, and you would not expect them to do otherwise. Hitherto the cost of a six-cylinder car has been beyond the ordinary motorist, but now that one of these can be obtained for £450, including side-entrance body, the argument should be at an end. Therefore, I suggest that you put the editorial comment "this correspondence must now cease," and just tell the public that Messrs. Friswell, Ltd., can supply a 15-h p. Standard six-cylinder car at £450, and more powerful ones at proportionate prices. I do not pretend to enter into any discussion as to the merits or otherwise of the six-cylinder car, and will conclude by saying that "you pay your money and take your choice."  
—Yours truly,

F. GUY LEWIN.

The well-known Parisian Actress, Mlle. Polaire, and her De Dietrich Car.

important to the man who seeks pleasure; but it becomes essential to the man on business. And many commercial travellers are learning the value of the automobile, either in car or cycle form, in this connection. But unless the roads from leading centres are made on Euclid's principle of the shortest distance between two points, full advantage cannot be taken of the speedy vehicle. The same argument applies to such hills as Porlock. They are prohibitive to many vehicles that are satisfactory under ordinary conditions and the provision of alternative routes should be regarded as a matter of urgency.

Now I have a suggestion to make to the Roads Improvement Association, or perhaps the active Automobile Association may see its way clear to accept the proposal. Why cannot we have a survey of a typical part of the country with a view to mapping out the shortest routes between various important places? Then we should ascertain where unnecessary mileage has to be traversed and proposals for the making of shorter tracks could be devised. If this were done it should prove useful ammunition in the campaign towards a central road authority, providing advocates with instances of likely advantages resulting from the provision of alternative routes to those now in use.

By this means the public would be shown how impossible it is to saddle many localities with the cost of such improvements, which, after all, would be most useful to people from a distance. This is one factor that must be kept to the front. All share in the convenience of such local improvements and consequently it is reasonable to argue that the cost should be national and not have to be provided by private generosity. At the same time I would urge generous support to Mr. Jenne's appeal, for, although such advice may appear inconsistent with

### THE FUEL QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the article in the *M.C.J.* of the 8th inst. respecting the investigations now being instituted by the Motor Union into the fuel question, I note particularly that portion which gives the views of Mr. J. F. Bennett with regard to his method of constructing a carburettor for the consumption of paraffin in motor-car engines. It may be of interest to the Motor Union and Mr. Bennett to know that as a result of a deal of study and experiment of the ways and means of constructing a carburettor that will satisfactorily carburette any grade of spirit (including alcohol) of whatever density and in any temperature, and that would give satisfactory results with paraffin, I arrived at exactly the same conclusions as Mr. Bennett, viz., that the only satisfactory method was to spray the paraffin or other fuel on to a heated surface, and to effect this by the automatic action of the engine.

The method which I have adopted for achieving the ends enumerated above in a carburettor which I have recently patented is practically identical with that described by Mr. Bennett. My carburettor consists of a single jet the orifice of which is covered by a needle valve which is capable of adjustment. Over the jet is placed a hollow chamber which is in communication with a jacket encircling the carburettor. The jacket is divided into two sections or compartments, one section being fed with exhaust gases from the engine. On the entry of the exhaust into one compartment, its passage being obstructed by the division plates, its course is turned into and through the hollow chamber over the jet, from which it emerges into the second half of the jacket and out into the

atmosphere, or preferably through another tube into the silencer. Normally, provision should be made to pass a sufficient quantity of exhaust gas through the carburettor to raise it to a high temperature, and a regulator provided to reduce the heat to that which is found to be correct for the requirements of the fuel which is to be carburetted.

I have used this carburettor for petrol, alcohol and paraffin. With petrol of any grade I have had splendid results. I found it necessary when working with alcohol, to first start with petrol or to use some external means of warming the carburettor, only a very small amount of heat being necessary to effect a start. In actual running, the results I obtained from alcohol were in every way equal to petrol; the engine (air cooled) kept cooler, the speed on the level was quite equal to that obtained from petrol, and the power on hills slightly superior. With paraffin it is necessary to first start on petrol. The latter can be shut off immediately the engine is started, and in actual running I have found that as used in my carburettor there is no practical argument against the use of paraffin, no fouling of valves took place, and I was never once stopped through dirty plugs. I shall be pleased to furnish a sample, drawings, or any other particulars concerning this carburettor to the Motor Union Committee if they think it worth while giving their attention to same.—Yours truly,

CHAS. E. PILCHER.

### A DARRACQ CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if, through the medium of *M.C.J.*, you could tell me if I can improve a 12-16-h.p. Darracq by fitting a wipe roller contact maker, instead of a make and break. My engine is very hard to start and I do not seem to get full power from it. Which contact maker would you recommend? I think everything else seems all right. Yours truly,

D. G.

[A roller contact would, without doubt, improve the running of our correspondent's car somewhat, and would also be a great advantage in facilitating the starting of the engine. It would, of course, need a trembler coil, unless the existing coil be fitted with an auto-trembler. A good type of suitable roller contact is that made by Messrs. Lacoste. We have used one of this type for the past two and a half years without trouble.]

### SOLID TYRE EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Tramp" will have wheels of larger diameter fitted to his car—40 in. diameter minimum—shod with about 3 in. solids, he will be able to drive on good country roads up to thirty miles per hour, and will scarcely be able to detect any difference from pneumatics except in a little increased road noise.

On the very bumpy roads in and about London he will have to drive considerably slower than with pneumatics. Provided his springs are good he will do no damage to his car in any way, and will find, moreover, that he has to a great extent solved the dust nuisance problem.

The type of solids is, I think, immaterial, provided the rubber is good and resilient; those fitted with side flanges are, in my opinion, the best.

As long as the pneumatic tyre trade is such a profitable one the public will be misled by these fables of terrible vibration and great reduction in speed.—Yours truly,

J. BRYANT.

### THE LEON BOLLEE CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I believe it is the impression among some automobilists in England that the Leon Bollée car is somewhat complicated and difficult to understand. This may have been the case with the first models introduced into Great Britain about five years ago, but surely it is time such an erroneous idea should be dispelled. As a user of a Bollée car I made a special point of visiting the Bollée stand at the Paris Salon and was much struck with the absolute simplicity of the 1907 models; in fact, after inspecting every other chassis in the Show, I came to the conclusion that the Bollée was certainly the simplest of the many high-class chassis exhibited.

I do not wish to enter into any description of the car or to enumerate the new features—important as they are—for 1907, but simply to give my impression of the vehicles shown at the Paris Exhibition. May I say, in conclusion, that I had a run on the new 18-24-h.p. model, and for extreme silence without loss of power I consider it second to none of the cars I have ever tried.—Yours truly,

W. F. LOWNDES BUTCHER.

### BRITISH AND FOREIGN AUTOMOBILE INDUSTRIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Manville's letter in a recent issue, his deductions with regard to the rate of increase in the importation of foreign motor-cars are perfectly correct. I would like to point out, however, that your correspondent has entirely left out of account the importation

of "parts"—the very next item in the monthly returns—which jumped from only £717,348 in the first ten months of 1905 to £1,598,686 in the same period of the current year. I may be wrong, but I am under the impression that motor-cars comprise only complete vehicles and that "parts" include chassis. If the latter are included with cars, then, in view of such a large importation of parts, all I can say is there must be a large number of so-called British built cars parading under false colours. In any case, taking cars and parts together—and this is the only proper way—they show at present no tendency to decline, and I for one think that Mr. Manville will, a year hence, be sorry he made such a rash prediction.—Yours truly,

VERACITY.

### SIMPLIFICATION IN VALVE MECHANISM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. S. Cunningham's letter in a recent issue of the *M.C.J.*, I quite agree with him that there is still room for improvement in the valve mechanism of petrol engines. Curiously enough, I came across an engine at the Paris Salon last week somewhat on the lines of what your correspondent suggests. It was shown on the stand of the Vulpes Co. The cam shaft is not longitudinal, as usual, but is placed transversely and operated by worm gear off the crank shaft. A special cam is provided at the end, which, by a novel arrangement of levers, operates both the inlet and the exhaust valves at the desired moment. I have not seen the engine at work, but, so far as one could see, the arrangement is a practical one.—Yours truly,

A YORKSHIRE AGENT.

### IMPRESSIONS AT OLYMPIA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to send you a few of the things I noted the Show had not proved. The elimination of the change-speed gear. Far from it. In a good many cases three speeds have been abandoned in place of

The 35-h.p. Daimler Car recently completed for Col. Wellcome, and on which he is shortly touring through France, Italy, Spain and America. The body, which is of the "Royal" type, is painted dark green with vertical lines of a lighter shade. The interior of the limousine is upholstered in buff cloth trimmings as used on the French State Railways.

four. The rapid growth of the six-cylinder. At first sight one might be led to suppose that the six-cylinder is fast growing, but in reality this is not so. A few new firms have included it in their list, because they considered it up-to-date, but the majority of these hasty additions exhibited were very poor specimens, no details being thought out at all. The universality of the metal clutch. Not a bit of it. Our old friend the leather clutch is still very strongly in evidence, and if it is properly designed it is half the trouble and worry of the plate varieties. The evil of the chain drive. In small cars the chain drive may truly be said to be dead, but not so in large cars. A few of the largest and best houses adhere to the chain drive, and seem likely to for some time to come.—Yours truly,

RAMBLER.

### TOURING IN BRITTANY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the concluding remarks in that most interesting account of a three weeks' holiday in Brittany, by Mr. G. C. Ashton-Jonson, in the *M.C.J.* of the 1st inst., I think this gentleman is a little too sweeping in his remarks on the catering of the cross Channel steamers. Admittedly I know nothing of the Southampton-Havre service, so of that I say nothing, but with the Dover-Calais, Folkestone-Boulogne, and Newhaven-Dieppe routes I am fairly well acquainted; with the last named very well indeed. Allow me unbiassedly to inform your correspondents that the catering in every way on the Newhaven-Dieppe route leaves absolutely nothing to be desired. The food and drink is good, plentiful and cheap; the stewards are attentive and the serving is quick. For all and every reason I can heartily recommend the Newhaven-Dieppe route to your readers; the railway service on either side the Channel is good and comfortable, the steamers are fast

safe, and commodious; the scenery of Sussex in England, and of the Valley of the Seine and Normandy in La Belle France, is the prettiest of any route to Paris. I advise automobilists to use the Brighton road to Brighton, and thence take the Newhaven road through Rottingdean, which, though hilly, has better surface than the Lewes-Newhaven road. Yours truly,

ALAN A. L. HICKMAN.

## SIDE-SLIP AND THE FIXING OF NON-SKIDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There are plenty of non-skid devices about, and yet we still hear of accidents due to side-slip, and frequently in cases where some non-skidding arrangement has been in use. Now a good many people are still ignorant of one or two facts about side-slipping. We generally find a car fitted with either one or two non-skids on the back wheels. But what about the front? Often none at all! Now the fact of a car, particularly a vehicle with a heavy body, having non-skids on the back wheels is rather conducive for the slipping of the front wheels, i.e., although the front wheels may be turned to negotiate a corner, the car still continues straight on, which is most dangerous, as failure to bring the car to an immediate standstill means a collision with a wall, or a run over a hedge, or some other equally unpleasant accident. No, the front wheels should most decidedly be protected, and a really good plan is to arrange the non-skids diametrically opposite, one, say, on the left front wheel, the other on the right back. Two are, from a side-slip point of view, better than one, on the back wheels, as it is possible to get a side-slip with only one, but this rarely happens unless reckless driving is indulged in. Two non-skids on the back wheels of a live axle car have their objections, as there is no slip on the road at starting, and there are no chains to absorb the first shock.—Yours truly,

HILLORSEA.

## THE AGENCY QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The attempt recently made to draw up a series of restrictions with which to hedge the agent as though in a kind of compound has apparently collapsed for the present. But the present seems an opportune time for considering the general question of motor-car agencies and the dictatorial policy adopted by many makers with regard to the way in which the agent shall sell the cars at his disposal.

It is often difficult enough to sell cars without any restrictions, but when we are proscribed for exhibiting at shows which are likely to be useful means of publicity there seems a good reason for the "turning of the worm." In many places the agent builds up a new business with one or more types of cars, popularising them in many ways; then suddenly the agency is transferred and no thought of compensation seems to enter the mind of the principal. This and other hardships are real and tangible, and possibly some agents in and about London who recognise the injustice and feel keenly on the subject may take up other points in connection with the matter.—Yours truly,

A. B. C.

## MASCOTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was with feelings of the keenest interest that I read in your issue of the 20th October (only just received here at Cape Town) the intensely interesting letter of Mr. C. M. Holloway informing your readers of the startling fact that he had managed to tame a black cat sufficiently enough to accompany him on his motor as a mascot; such information I feel sure is valuable, and as such will be read with world-wide interest, and without doubt, the thanks of all motorists are due to Mr. Holloway for having enlightened us on the matter. I regret, however, to be obliged to ask Mr. Holloway to allow me to have a share in being one of the first to have a black cat as a mascot, for not so long ago I took with me for a ride a black Hottentot woman, only my experience was not quite as good as that of Mr. Holloway, as, owing to a slight difficulty with a tree stump, my mascot fell out, both with my car and myself. Would it be too much to ask Mr. Holloway to keep us further enlightened as to further progress with his mascot (I nearly said *mosCAT*, Mr. Editor, but refrained in time), seeing that any information on this score will no doubt prove useful to many a motorist like myself, at the moment.—Yours truly,

MASCOTLESS.

THE SPEEDWELL CARS.—A correspondent at Haslemere, a doctor, writes:—"I must say that I find my 10-12-h.p. Speedwell car much more serviceable than were the two horses. Since I have had it, it has never failed to carry me where I wished to go. We have had no stoppage except for one puncture."

NON-SKID EXPERIENCES.—With reference to the letter of C. D. L. with regard to non-skids, Mr. A. Roberts, of the Roberts' Non-Skid Tyre Tread Manufacturing Company, Gripwell Works, St. Mary's Row, Birmingham, writes, that he will be pleased to place his own experience at the service of our correspondent if the latter will write him.

## CLUBS AND ASSOCIATIONS.

### HUDDERSFIELD BRANCH OF Y.A.C.

THE Huddersfield Branch of the Yorkshire Automobile Club has held its annual meeting under the presidency of Mr. W. H. Jessop.

Mr. E. G. Learoyd presented the third annual report, which stated that the membership had been increased from sixty-nine at the commencement of 1905 to ninety-seven at the beginning of 1906. At the present time it was 115. The hill-climbing competition passed off successfully, and Mr. Singleton succeeded in winning the cup for the best all-round performance. After an allusion to the infirmity ride, on July 27th, when seventy patients and twenty nurses were taken out, the report continued that a request had been received from the Meltham Convalescent Home authorities to take the patients in the home upon a similar excursion, but it was not thought wise to undertake an additional event of that nature for the present. The committee had recommended to the Huddersfield Corporation that they should place signposts at the corners of the various main roads in Huddersfield, and it was hoped that the proposal would be approved. The finances of the club were in a satisfactory condition, a balance of £19 14s. 4d. being carried forward. The receipts totalled £151 9s. 9d.

The Chairman, in proposing the adoption of the report and balance-sheet, said he wished to acknowledge the work done by the committee, every member having taken a deep interest in his work. He thought that they had reasons for complaining that the owners of motor-cars did not realise the advantages of being members of that club. The report did not enter into details of the work actually done for the benefit of the motorists of the town, but he might say that during the year they had to watch carefully not only local affairs, but also legislation. Motor-car owners in Huddersfield ought to recognise these facts by becoming members. During the last year there had been an increase of eighteen members, but there were only 115 members out of something like 317 motor owners in and about the town. Outside motor-car owners benefited indirectly by the efforts of the association. Mr. Arthur Dawson seconded and the motion was unanimously carried.

The election of officers resulted as follows:—President, Alderman W. H. Jessop, J.P.; vice-presidents, Messrs. Horace Broadbent, Elton Crowther, H. A. Crowther, D. S. Crowther, A. Dawson, H. Dickinson, E. W. Fisher, J. H. Kaye, J.P., and A. Mallinson; chairman of committees, Mr. Arthur Dawson; secretary and treasurer, Mr. E. Gordon Learoyd; committee, Mr. H. R. Carr, Mr. J. D. Crowther, Mr. J. Hilton Crowther, Dr. Edwards, Mr. Albert Kaye, Mr. E. Lawton, Mr. R. V. Middlemost, Dr. Prior, Dr. Rogerson, Mr. F. Sutcliffe, Mr. T. Shires, Mr. F. H. Wilson, and Mr. C. S. Middleton (the last named representing the motor-cyclists); auditors, Messrs. E. Lawton and J. D. Simpson; representatives on the Y.A.C., Messrs. F. H. Wilson and E. Gordon Learoyd; representative on the Motor Union, Mr. Alex. Mallinson.

On behalf of the members the Chairman then presented a motor timepiece to Mr. E. G. Learoyd in recognition of his services as hon. secretary of the club from its formation. Credit must be given to Mr. Learoyd, he said, not only for the foundation of the club, but also for his able services since. The work had been a great tax upon his time and energies, but he had proved himself an enthusiast in automobilism.

Mr. Learoyd, who was greeted with the singing of "For he's a jolly good fellow," thanked the members very much for the gift and the kind remarks concerning himself. He felt somewhat proud of that club. The other day he went to the dinner of the Yorkshire Club at Leeds, and, with the exception of Huddersfield, there was not one of the six affiliated clubs that had more than forty members. He believed, however, that the other clubs assisted the Yorkshire Club more than Huddersfield, and although the Huddersfield members had better cars generally than the members of the Yorkshire Club, yet they did not seem to care for joining in competitions.

### THE MOTOR VAN, WAGON AND OMNIBUS USERS' ASSOCIATION.

A MEETING of the executive committee of the Association was held at 1, Albemarle Street, Piccadilly, W., recently, when the following provisional report of the sub-committee appointed to deal with the probationary inspection of vehicles during first month of active service was submitted:—Although the motor-wagon is gradually becoming general for purposes of transport, and purchasers have a choice of many excellent types, the difficulty is still experienced by those who commence to substitute mechanical transport for their horse-drawn vehicles, in knowing what type of vehicle is likely to best suit their requirements. In such cases, not only is initial advice desired in specifying the conditions which they require to be fulfilled, but also in judging how far the conditions of sale of a vehicle are really complied with, and, moreover, as to the actual working of a commercial motor vehicle under service conditions, with a view to possible further purchases. The Motor Van, Wagon and Omnibus Users' Association are

prepared to undertake to supply all professional advice necessary to enable members to purchase vehicles best suited for their purpose, to supply them with standard specifications, and after the purchaser has made his own selection, if called upon by the purchaser, to carry out a standardised series of tests under service conditions, and further, to report on the working and extent to which the conditions laid down have been adhered to by the manufacturer. The particulars of these tests will be furnished to the purchasers only, and are not to be used for purposes of advertisement, except by resolution passed by the executive committee.

After some remarks, it was moved by the chairman, and agreed, that the scheme be approved in principle and circulated to the members for their suggestions.

#### SOUTHEND.

ALTHOUGH the club has only been in existence a short time, the membership is already a large one, derived not only from Southend, but from Shoeburyness, Leigh, Chelmsford, and the intervening districts.

Capt. J. R. B. Newman is the president, Dr. F. Silva Jones, a vice-president, and at the last committee meeting Mr. J. B. Carruthers was appointed chairman of the committee, Mr. F. W. Hertridge, delegate to

#### THE C.T.C.

WHETHER the Cyclists' Touring Club should be enlarged to include motorists and tourists generally is a question Mr. Justice Warrington, sitting in the Chancery division of the High Court of Justice, was asked to decide last week on a petition under the Companies (Memorandum of Association) Act, 1890. Mr. Eve, K.C., and Mr. Kirby appeared for the club, and Mr. Gore Brown, K.C., and Mr. T. B. Napier for dissentient members. Mr. Eve explained that this was a petition by the club, which was a company registered under Section 23 of the Act of 1867. They were registered in 1887, having been in existence as a more or less voluntary club since 1882. The amendment of the articles now proposed was to enlarge the club so as to include in it not merely those persons who toured on bicycles, tricycles, or vehicles of that description, but also those who used motors and horses for touring purposes. The club began for bicyclists only, and in 1882 it had 6,705 members. In 1895 the membership reached 16,343. In 1896 the total was 34,655 and in 1898 they had reached 60,449 members. About that time motor-cars began to supersede cycles, and by 1900 there was a drop of 4,000 members. By 1905 the membership had gone down to 35,785, while at the present time it was only 32,500. The annual subscription had always been small, the maximum being 5s., with 1s. entrance fee, which had alway

An Austrian Method of Hauling Home a Disabled Car.

the Motor Union, and the hon. secretary, Mr. A. Warnery, to the council of the Auto-Cycle club. Various social events have been organised for the early months of the New Year.

THE annual dinner of the Manchester Motor Club, which has now nearly 300 members, was a great success.

ON Wednesday, Boxing Day, the Sheffield and District A.C. met opposite the local Town Hall, for a run to the "Hop Pole," at Ollerton.

THE Leeds Motor Cycle Club will hold a competition on the 5th prox., in which the rider completing a run up a hill in the time previously estimated will be adjudged the winner.

THE next meeting of the Institution of Automobile Engineers will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., on January 16th, when a paper will be read by Mr. F. L. Martineau on "Accessibility and Cleanliness, and the best means of obtaining it."

MR. L. M. WATERHOUSE will read a paper on "Electric Circuits of Motor Boats and the Use and Construction of Accumulators" before the members of the British Motor Boat Club, on the 17th prox., and Mr. A. F. Evans will read a paper on the "Commercial Marine Oil Engine" on January 31st, 1907.

carried to a reserve fund, now amounting to £10,000. This had been increased by £5,000 or £6,000 balance of unexpended income. A postal vote of members had been taken as to the admission of all tourists, and of 12,657 answers received 10,443 were in favour of the council's proposal and 2,214 against. Some 18,000 to 20,000 members had not voted at all. At the meeting in Newcastle eighty-three members were present, when seventy-seven voted for the resolution and one against. The other five did not vote. The confirmatory meeting was held in London, and 368 members attended, when 210 voted for and 157 against. A poll was demanded, and 173 voted for and 156 against.

After a two days' hearing the judge said he was not satisfied that the alteration was for the interest of the members of the club generally, nor could he take the view that the voting had really expressed the opinion of the club as a whole. But the main ground for his decision was that the proposed change did not come within the Act at all. Motoring increased the risk of cycling, and one of the objects of the club was to protect its members against that very danger. It could only do so by taking measures against another class of its own members. It was impossible to combine the business of catering for and protecting the rights and interests of cyclists with that of catering for and protecting the interests of motorists, and the petition must be dismissed with costs.

## CASES UNDER THE MOTOR-CAR ACT.

### THE BRAKESMAN ON TRAILERS.

**MOTOR LURRIES.**—Several drivers employed by manufacturing firms in Manchester have appeared before the justices at the Manchester Court for breaches of the "Use and Construction" Order of the Local Government Board, made under the Motor Car Acts of 1900 and 1903. Steam power is coming largely into use for the removal of heavy goods by road from mills and works outside to warehouses in the city. Frequently a steam motor lorry has coupled to it a heavily laden "trailer." Under the order referred to the trailer, apart from the motor, should carry a brakeman to operate the brakes, but the practice seems up to now to have been for the one brakeman in attendance to ride beside the driver. This fact was remarked upon by the City Coroner at the inquest on a child who was killed recently by being run over in the street by the trailer of a motor-lorry. One of the defendants summoned last week was Charles Turton, of Hulme. He is employed as a motor driver by a firm of manufacturers in the city. He was taking a load of cloth along Oldham Road, on the morning of December 4th, on a trailer, when a policeman noticed that the trailer was unprovided with a brakeman. The defendant's name was taken by the officer, and he was summoned. The facts were admitted, but the manager for the defendant's employers contended that in such a case the order was impracticable. There were, he said, two men with the motor, the driver and a brake-man, who rode together, the fact being that there was no provision at all for a man to ride on the trailer. If the letter of the order must be observed the brakeman would require to ride on top of the load, and every time the brake was applied he would have to descend a ladder. In the majority of cases where trailers were used, the manager added, the same conditions prevailed. The presiding magistrate, Mr. C. Hughes, said it was a technical point, but the police were not to be blamed for the action taken. Personally he did not think the Act meant that there should be a third attendant. No fine would be imposed, but an order would be made for payment of the costs. The manager thanked the Bench, and said that representations would be made to the Local Government Board with a view to having the order annulled. He thought, upon consideration, they would assent to that.

### THE AERO SECTION OF CORDINGLEY'S EXHIBITION.

THE Executive Committee of the Aero Club have drafted the rules and regulations which are to govern the competition at the Royal Agricultural Hall next April (6th to the 13th) for the three best working models of an aeroplane, for which the proprietors of the "Daily Mail" have offered £250. This sum will be divided as follows:—First prize, £150; second prize, £75; third prize, £25.

The conditions of the competition are appended:

The prizes are offered for model flying machines weighing when in flight not more than 50 lb. No machine weighing, when in flight, less than 2 lb. to be eligible for the first and second prizes. Minimum flight under its own power to be 50 ft. in a direct line, measured on the ground. The starting point to be not more than 5 ft. above the ground. Independent power may be used for starting. No portion of the machine, during flight, to have any contact with the ground. No gas to be used to assist in lifting power.

The judges in awarding the prizes will take into consideration:—1, length of flight; 2, practicability; 3, stability; 4, steering power, horizontal and vertical; 5, speed; 6, excellence of design; 7, excellence of construction; 8, method of commencing flight; 9, available lifting power.

The judges reserve the right to make practical tests of the models, both under cover and in the open. They reserve the right not to award the prizes if in their opinion the models are not of sufficient merit. No entrance fee or charge for space is made, and full particulars may be obtained from the Secretary, Aero Club, 168, Piccadilly, London, W.

### COMPANY NEWS.

#### NEW COMPANIES REGISTERED.

**NEWHEY MOTOR COMPANY.**—£5,000. To acquire the business of Newhey's Midland Garage, Station Street, Birmingham. First directors, Messrs. C. J. Newhey (managing director), E. G. Newhey, and W. B. Kent. Station Street, Birmingham.

**BERNA MOTORS.**—£20,000. To carry on all kinds of trading, manufacturing, and financial business in connection with motor-cars, &c.

**NEW IGNITION SYNDICATE.**—£6,000. First directors, Messrs. A. W. Fenton, W. J. L. Sandy (managing director), and H. T. Middleton, 6, John Street, Adelphi, W.C.

**CATERHAM AND DISTRICT MOTOR COMPANY.**—£15,000. To acquire the business of owners of tractors, traction engines, and motor vehicle, haulage contractors, &c., carried on by Messrs. A. Ostlere, A. Bevit, and G. C. Barber, at Caterham, as the Caterham Traction Company, and to adopt agreements (1) with the said vendors, and (2) with Mr. J. Goode. Minimum cash subscription, £3,000. First directors, Messrs. A. Ostlere, B. M. Goode, and E. W. Sawyer. Alderman's House, Bishopsgate Street E.C.

**MOES (ENGLAND).**—£1,000. To acquire the sole agency in the United Kingdom and its colonies and dependencies for motor chassis and cars made by the Société Anonyme d'Electricité et d'Automobiles Moes, Paris, and to adopt an agreement between the said Société, the Roadway Autocar Company, Ltd., and Messrs. Charles Jarrott and Letts, 45, Great Marlborough Street, W.

**J. W. GREENWOOD.**—£5,000. To adopt an agreement with Mr. J. W. Greenwood, and to carry on the business of proprietors or hirers of motor-cars and other vehicles.

**S. M. CAR SYNDICATE.**—£30,000. To acquire certain patents and rights relating to (a) improved means for automatically regulating the stroke of the pumps of steam generators, (b) improvements in liquid fuel burners, and (c) other improvements in motors and like engines, and to adopt agreements (1) with Mr. R. H. Edmondson and Mr. G. J. Shave, and (2) with the Albany Manufacturing Company, Ltd. First directors, Messrs. J. H. Edmondson, G. J. Shave, F. Lamplough, and A. O. Cook. Cumberland Park, Willesden Junction, N.W.

### ROAD REPORTS.

**CHELMSFORD.**—At last week's meeting of the Chelmsford Rural District Council, the surveyor was instructed to make experiments with regard to the efficient repair of the roads.

**LINCOLNSHIRE.**—A portion of the Casterton road (the main road between Stamford and Grantham), near the Stamford borough boundary, will be repaired in the new year, Mr. F. Ryman, the surveyor, expecting to commence the work in about two months' time. The road will be steam rolled as the granite is laid.

**PATCHING** on the main roads outside the town of Louth is now in progress, and, not having a steam roller, is worked in by the traffic. The main streets in the town are of tar macadam, which proves a great boon to motorists, and it is the intention of the Borough Council to carry out more of this work every summer.

**SUSSEX.**—A conference of councils at Hassocks has approved of a scheme to cut a new road through the South Downs to obviate the dangerous gradient at Clayton Hill, on the London and Brighton road. The road is to be a mile and a quarter in length, and the estimated cost of the work is about £13,000. Locally it is hoped that effect will be given to the scheme by the East Sussex County Council and that Brighton Town Council will contribute towards the cost.

**TORQUAY.**—No road repairs out of the ordinary will be undertaken at Torquay for some little while.

**TYNEMOUTH.**—The Tynemouth Corporation have informed the Automobile Association that they intend to bring before Parliament a new Water Bill. As the work proposed will involve certain alterations in the roads of Northumberland, the Association has been requested to state whether it had objections to make to the proposed changes. If any member living in this district has objections to the Tynemouth Bill the Committee will be glad to give expression to his views.

**UCKFIELD.**—Both the roads leading into Uckfield from the directions of Eastbourne and Tunbridge Wells are up for repairs, and it is impossible for motorists to avoid loose stones.

**UXBRIDGE.**—The Uxbridge Council have decided to lay tar macadam over a distance of about a third of a mile in the centre of the town. The stretch of tarring on Hillingdon Heath in the summer was very successful in abating the dust nuisance, and now that the roads are heavy and muddy, it is the cleanest stretch near that locality.

**YORK.**—There are no extensive repairs contemplated in the city of York that will be of any inconvenience to through motor traffic during the next few weeks.

### PUBLIC MOTOR SERVICES.

**MR. T. F. RICHARDS** has asked the Home Secretary whether he was aware that it was becoming a common practice to compel motor-omnibus drivers to drive their omnibuses on the piecework system, and whether, in the interest of public safety, he would, at an early date, introduce legislation that would secure a *maximum* working day at this work of nine hours per day. Mr. Gladstone replied to the effect that motor-omnibus drivers in some instances received their full rate of pay for the performance of a fixed number of journeys per day. For lost journeys some deduction is made. He understood that the hours of work of motor drivers averaged about nine and a half daily, except in the case of the Vanguard Company, who on one route employed their drivers for thirteen and a half hours a day, giving them one day's rest in three. The average day on this route was thus one of nine hours.

ON Wednesday of last week a motor-bus, after skidding on the tram lines in Great College Street, Camden Town, N.W., turned into a shop and completely wrecked the front of the establishment.

THE local authorities of Romford and Harrogate have each decided not to apply for powers to run motor-buses, it being thought that such should be reserved for private enterprise.

A NEW time-table for the winter season has just been issued by the Dartford and Farningham Motor-Bus Company, of which Mr. S. H. Smith is manager.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, JANUARY 5, 1907.

[No. 409.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

**A** NOTHER step towards the attainment of perfection in motor-buses will shortly be taken. This should be in the direction of discouraging in a practical way the tendency of such vehicles to describe wanton curves in the public streets. Entries for the Side-slip and Skid Prevention Competition of the A.C.G.B.I. closed on Monday, and about forty devices

will take part in the forthcoming trials. A full list of these appears on page 1001, and we would suggest to the judges that they should not exercise their powers with regard to the elimination of devices without test in too stringent a spirit. When the Regulations were issued we expressed the view that the opinion of the judges as to the suitability of the inventions should not be regarded as final. If upon their preliminary inspection of drawings the subsequent examination were to depend, some injustice might unwittingly be done. It will be far better to give a practical test to all the entries, so that the correspondence that frequently follows such competitions may be avoided in the present instance.

### Motors in Australia.

ELSEWHERE we make reference to the Dunlop Reliability Trial which has been held in Australia. Our correspondent at Melbourne writes that while it would appear, on the face of it, a trade affair, "it must be said, in justice to the promoting company, that it aims to further automobilism. The motor is still in the open stage here, and not at all seriously regarded by many citizens. The Dunlop Company have induced the Automobile Club of Victoria to take more than ordinary interest in it. Indeed, the company have intimated more than once that as soon as the young club feels itself strong enough numerically and financially it will be pleased to hand over the trial, as an annual affair, to it. The contest cost the company £400 this year to conduct. Cars were sent over the various routes previously, and the cross-roads, junctions, dangerous turns and bad crossings were suitably marked by specially prepared signs, and all at the expense of the promoters. It may seem strange, but it is the exception rather than the rule for any county to have finger-posts at the junctions."

### Testing Eyesight.

ACQUAINTANCE with the rule of the road and ability to drive a car are important factors in obtaining a certificate of the A.C.G.B.I. To these will have to be added a third, if the alarm of the "British Medical Journal" extends to 119, Piccadilly. In an article on "Vision Testing in the Public Services," the "British Medical Journal" of this week discusses several papers read at the Section of Ophthalmology of the British Medical Association. One of these, by Mr. Arnold Lawson, condemns the Snellen's test types as unsuitable for dealing with recruits for the Army, and on this point the "Journal" thinks he is convincing, adding, "If the test is undesirable when dealing with recruits, still less can it be

desirable in the testing of engine-drivers, and in what has not yet come into existence, but cannot come too soon, the examination of candidates for an automobile driver's certificate." The "B. M. J." thinks that Mr. Lawson's alternative method of examination may well be seriously considered by the authorities, and hopes that his general criticisms will not be forgotten when we have advanced so far as to insist upon the vision of would-be motorists being gauged." Defective vision, increased by strain and fatigue, and with its accompanying incapacity for judging pace and distance, is, our contemporary thinks, undoubtedly responsible for many of the daily-occurring accidents. This article is certainly a curious commentary on the Motor Car Act, 1903—which, by the way, expired on Monday—under which the halt and the blind have been licensed as capable of driving automobiles. The idea of testing and gauging eyes and ears, and generally subjecting everybody to periodical examination, is now being advocated by experts of every kind. What would some of the old heroes of speed, of whom Mr. C. Jarrott writes in his latest volume, have thought of the idea that they should not participate in the race until their eyes had been tested?

### A World's Record.

SHOULD Mr. S. F. Edge succeed in his effort to complete a run of nearly 1,500 miles in twenty-four hours on the Brooklands racing track, the occasion will be a memorable one, and should give the new racecourse world-wide renown. He intends, as soon as the new track near Weybridge is available for the purpose, to have a twenty-four hours' run of sixty miles an hour on a 60-h.p. six-cylinder Napier in order to demonstrate the absolute reliability of the touring car, even when driven continuously at a high rate of speed. This should quicken public interest in the attempt to popularise motoring as a sport for Britishers. Meanwhile, comes the letter from Mr. J. Edgar Lound, who points out that the Brooklands track has, so far, been mainly the result of private enterprise, and that the trade, upon which, after all, the success of the venture will greatly depend, has hardly been considered. On the other hand, we have heard it urged that the public should be persuaded that the enterprise is a sportive rather than a commercial affair—so that there seems ample room for the discussion for which he asks.

### An English Riviera.

BEYOND the police traps that serve as barricades to some of the districts of the south of England, is the pleasant seashore where motorists love to foregather. When the lanes are not tinged with blue and when big boots of an official order are not objects of interest on the path, travellers journey thither from the Metropolis in safety; otherwise there are dangers on the way. We mention this point for the benefit of Councillor G. H. Warne, of Worthing, and those who are operating with him in the endeavour to unite the towns of Brighton, Hastings, Eastbourne, Worthing, and Bexhill, in an effort to attract the visitors who now go to the Continental Riviera. Eastbourne and Worthing have already experienced the delights of flower fetes; Hastings has had its motor-car gymkhana, and Bexhill and Brighton have seen the fleetest cars draw the crowds from neigh-

bouring places. Having considered these things, and remembering that the Sussex County Automobile Club has imagination and public spirit, Mr. Warne is hopeful that something may be done to make the quintette of towns we have mentioned attractive to the motorist, appealing to his love of sport in the hope of keeping some of his expenditure on this side of the Channel. The idea is laudable and patriotic, and although the south coast cannot hope to rival the balmy air of the Riviera, where luscious fruits were picked in the open on Boxing Day, something may be done to promote the prosperity of our holiday resorts; but, and this must be fully recognised by the authorities, the way to the sea coast must be cleared of police traps and other obstructions inimical to the welfare of the districts in which they are set.

#### Illicit Commissions.

Now that the Act for the better prevention of corruption has become law, the opinion is being expressed that it may tend to a reduction of that quest of secret commissions which seems the main object for which some folks have conceived an affection for the motor-car and all its works. Of the existence of this evil in our industry there is no manner of doubt. We recently heard of the son of a public man, who persuaded his parent to buy a certain make of car, and then went to the agent for "my share in the business." Whether the new law will rehabilitate the conscience of such a youth is dubious, but the fact that it will render the transaction somewhat risky may prevent the multiplication of such instances. The new Act consists mainly of three clauses, which assign punishment for the giving or offering corruptly of bribes or commissions in every form; for the accepting or asking such corrupt inducements; and for the use of any false accounts or other documents intended to deceive the principals interested. Its penalties on conviction include fines in money and imprisonment, with a maximum of £500 and two years respectively. Such an Act is but little likely to be enforced by individual effort; and a Secret Commission and Bribery Prevention League has been formed with offices at 58, Coleman Street, E.C., to admit of collective effort in a manner analogous to that of the Society for the Prevention of Cruelty to Children, which has made effective the legislation dealing with that subject; and in that of the Mansion House Railway Rates Association, which has been of benefit to the trading community at large.

#### Motor Fuel.

Thus far the most important witness on the supply aspect before the Fuels Committee of the Motor Union has been Dr. Dvorkovitz, whose further views on the matter are given on another page. When before the Committee on the last occasion the expert showed experiments with six samples of motor spirit, whose range of specific gravities were from the lightest to the heaviest of benzines. All evaporated except one of specific gravity .750, which had not been properly refined, whereas one of the same specific gravity (.750) which had been properly refined completely evaporated, leaving no trace of oily substance on the white paper. He remarked that he had a sample of .694 gravity, representing the old standard at which supplies of motor spirit used to be obtained, also a sample with a specific gravity of .720, a good average of the petrol now sold; but it was to the samples whose specific gravity ranged from .739 to .785 that he particularly desired to draw attention. He pointed out two samples of .750 specific gravity, a white sample having been redistilled in his own laboratory from the one possessing a yellow tint. All the samples shown he regarded as equally suitable for use by the motorist, with this difference, that the heavier the specific gravity the greater the calorific value per unit volume, and accordingly it requires a slight adjustment in the direction of increasing the air supply in order to ensure complete combustion. The motorist could easily make this adjustment, and if he would

throw aside prejudice Dr. Dvorkovitz believes he would find it just as satisfactory to use heavy as light spirit.

#### The Roads of England and Wales.

LOCAL government is becoming an increasing means of expenditure, and the returns just issued by the Department over which Mr. John Burns presides contain some figures of interest to those who travel along the roads—by motor vehicle or any other form of carriage. The financial year of the L.G.B. ends on March 31st, and the balance-sheet is issued within four or five days of the end of the calendar year in which they close. The total length of the main roads maintained by English and Welsh local authorities was 27,380 miles; other than main roads 95,001 miles of highways were kept up by rural district councils. To repair, maintain, and, in some cases, remake these roads, an expenditure of £3,373,128 was entailed. That motorists have paid their contributions to the expenses of local government is evident from another part of the report, in which we learn that 1,249 summonses for reckless driving were issued during the twelvemonth ended March 31st, under the Motor-Car Act, 1903, as well as 502 prosecutions for exceeding the legal limit—to say nothing of the frivolous charges in connection with lights on cars and similar matters.

#### Glaring Headlights.

OUR reference last week to the devices lately introduced with a view to reducing the glare of headlights on approaching towns and other places where such a change is desirable has evidently not been overlooked by many of our provincial readers, who will be further interested in the reference to the new devices that were on view at the Paris Salon—at the conclusion of our report on the exhibits in the present issue—a report which we are glad to recognise has been of considerable assistance to some of our journalistic confreres. Reverting to the glaring headlights, it may be noted as a subject of discussion at the Boxing Day meeting of the Stockton Chamber of Agriculture. It was said that the searchlights had got beyond the purpose of being a mere signal of approach. The huge acetylene lamps created such a blinding glare that other road-users could not see anything but them, and many horses would not face them. Mr. T. B. Bainbridge said the Central Chamber, of which he was a member, were of the opinion that the penetrating power of the motorists' lamps should be reduced. This would conduce to safety in a twofold sense, as car drivers would not be able to travel at the speed they did at present at night. No resolution was adopted; but undoubtedly the country is looking to motorists to support the enterprise of those makers of lamps who are working towards a mitigation of the nuisance—for such, to use a mild word, it is in many districts.

#### In South Africa.

Now that South Africa is entering into the calculations of British makers of motor-cars, we would emphasize the warning which an United States Consul has just given to American manufacturers endeavouring to cater for the market. For use on the Rand, a car on general touring or runabout lines is suitable, but for use on roads which intersect the veldt, and frequently on the veldt itself, special features of construction, such as extra strong springs and well raised bodies, to admit the "negotiation" of spruets and water-courses, are essential. For use in any part of South Africa, aluminium bodies are very popular, as wood, unless exceptionally well seasoned, warps badly under the sub-tropical sun. The proposal to provide motor-roads in South Africa is said to find extensive favour, for it is estimated that they can be constructed at a cost of £500 per mile, as against £4,000 per mile of railway, and that motor vehicles would carry passengers and mails more expeditiously and with greater economy than a railway.

**Signs on the Road.**

CARE must be taken lest a multiplicity of signs on the roads leads to confusion. Both the Automobile Association and the Motor Union are engaged in the useful work of having villages named in such a way that passing motorists may easily learn their whereabouts, and each of these organisations is looking after the provision of warning signs to motorists on the public roads. Mr. Leveson Scarth, the chairman of the Signs and Notices Committee of the Motor Union, has extolled the action of the Berkshire County Council in this matter, that public body having erected about 450 caution posts at dangerous corners, cross roads, and other places where unusual care should be taken. Extremely dangerous cross roads in Berkshire are indicated by white crosses being placed below the ordinary plates. The latter are 2 ft. by 10 ft. and are riveted to white posts. A note of warning may, however, be struck ere these signposts become general. What is really wanted is a uniform system like that which is in vogue in France, where special diagrams have been prepared, indicating the special character of the danger to be encountered. These mean the same thing

**Progress in Ireland.**

GOOD sportsmen as they are, the speedy qualities of the motor-car have always appealed to the Irish people, who are likely to be interested in the Motor Exhibition that opens in Dublin to-day (Saturday). This is the first show of the kind held in the city, and its inauguration speaks well for the vitality of the Irish Automobile Club, of which Sir Horace Plunkett is the president and Sir William Goff the chairman. When the idea of the show was first suggested its success was more than problematical; but, thanks to the efforts of Mr. Edward White, the energetic hon. secretary of the club, and a sub-committee, consisting of Mr. Hum Bland and Mr. J. C. Percy, J.P., the project has been developed to a good degree of success. It is a sign of the times that Ball's Bridge, where the exhibition will take place, has hitherto been associated with the horse, so that the two rival means of locomotion will have a common platform from which to advocate their claims. In these columns it is unnecessary to dwell upon the importance of the road to the development of the car; but we would suggest to our Irish readers that not until that is fully recognised by the road

The Automobile Association's new Road Signs.—Reproduced from a flashlight photograph taken in the snow at Hatfield last week.

wherever they appear, and thus prevent the confusion that must result from any haphazard ideas being allowed adoption.

**Chauffeurs and their Hearts.**

A NOVEL and, at the same time, an important point with regard to the engagement of chauffeurs has arisen at the Newcastle County Court. Dr. Drummond is a medical practitioner of that northern city, and, like most wise doctors, economises time and, we trust, reduces expenses by using a motor-car on his rounds. His driver was ill two or three months ago, and on his recovery from pneumonia the doctor found he was suffering from heart disease, and was physically unfit to drive a motor-car. Under the circumstances, therefore, he gave him prompt dismissal. But the chauffeur claimed for a week's notice and sued the doctor for wages in lieu thereof. Dr. Drummond made defence that owing to the state of his heart he was physically unfit to drive a car. Hence the dismissal, which Judge Greenwell agreed was justified on the medical grounds advanced by the doctor. The case is of more than local interest.

authorities of the Emerald Isle will the country have the full advantage of the automobile.

At the Queen's Head Hotel, Shrewsbury, an examination for the A.C.G.B.I.'s certificates will be held on the 17th inst.

In London the motor-bus has completely vindicated its claim as the successor of the horse vehicle. The latter broke down almost completely under the terrible conditions of Boxing Day, and the strenuous efforts of horses to struggle up ice-covered inclines were really pitiable. Motor-buses went bravely on in the snow, the half-frozen surface furnishing an excellent surface for the tyres which skidded not. Here and there drivers complained of trouble with the lubricating oil; otherwise they were not seriously disturbed by the unusual condition of things. But following the snow came the brown compound of mud and snow which made a Strand of Slush of the principal artery of London, and enabled the vehicles to splash the pedestrians as they literally ploughed their way through thawing snow and dissolving salt. Still it was a triumph for the motor-bus, as the passengers of the new trams of the L.C.C. were fain to admit.

## IN THE SNOW.

MANY motorists had a new experience last week, when we were regaled with an Old Time Winter—almost a novelty in this very modern century. Fortunately, the motor-car is not rendered *hors de combat* by the changing temperatures incidental to our British climate, and again demonstrated that it is more than a fair-weather vehicle. In the country the motor-car was largely used for conveying parties to festive gatherings, and in hilly districts must have saved much suffering to its equine rival. But some enthusiasts had cool adventures after the snow of Christmas night, and when Boxing Day dawned, with its white coverlet shrouding roads and hedges, it was very difficult to distinguish the highway from the footpath. Our letter box has been filled during the last few days with eulogies of the behaviour of motor-cars during the period of Arctic weather, and we shall be glad to have news of any interesting experiences which may have occurred to readers. On Boxing Day Mr. R. M. Wright, of Lincoln, drove his 15-h.p. Humber car over 100 miles with an average of six inches of snow lying on the ground. This was accomplished in a most satisfactory manner, no difficulty being experienced in any way what-

behind to stop immediately. The action of putting on the brake and clutch was momentary; but at the same instant a long sagging trolley wire, which had been invisible to the driver owing to its lying parallel with the top of the wind screen, came across and struck Mr. Edmunds and his companion, Mr. Rawlings, across the cheek, carrying away Mr. Edmunds' cap. Luckily, Mr. Edmunds' son, besides giving the warning shout, reached forward and lifted the heavy copper wire, thus causing it to miss the chins of the occupants of the front seat. The whole incident only took a fraction of time, and even as it was the trolley wire was a couple of feet behind the car when the party stopped. The party afterwards proceeded to Purley and up the Caterham Valley to Oxted. The snow here in some places was very deep, some ten or twelve inches; but the car behaved well, and by means of a pair of Parson's Grippa chain non-skids was enabled to negotiate the slippery roads with ease and comfort. Apart from the shock of the accident, fortunately no damage occurred; but this would show that the driver must be very careful with a wind shield in judging of the distance of parallel objects.

Very trying have been some of the adventures of the motor mail vans. The motor parcel mail van travelling between York

Motoring in the Snow near Paris on Boxing Day.

ever. The tyres fitted to the wheels of the car were Palmer cord ribbed, and it was quite easy, with the usual complement of four passengers, the car being fitted with hood and glass screen, to maintain an average speed well up to the legal limit of twenty miles an hour.

On Boxing Day, while motoring with a party of friends, Mr. Henry Edmunds had a narrow escape from what might have been a very serious accident. He and his party, on his Daimler car, were running over the snow-covered roads from Clapham, via Mitcham and Beddington, and just after crossing the railway bridge at Beddington, before going on to Purley, they were warned by two men that the gale and storm had brought down some of the electric trolley, telephone, and telegraph wires on the newly-equipped road leading from Croydon to Epsom. On receiving this warning Mr. Edmunds pulled up his car and proceeded cautiously. On approaching the road he saw the great amount of damage that had been caused by the storm. Many of the posts carrying the wires were lying across the track, and the supports of the trolley wires were bent and twisted. Proceeding very slowly, where there appeared to be a clearance, he was just able to cross the road when his son shouted from

and Leeds was snowed up at Whinsmoor, near Scholes, being completely buried. A private motor-car also came to grief at the same place. One early morning last week the motor mail which runs between London and Bishop's Stortford, when in the heart of Epping Forest, crashed into a snowdrift with such force that it was nearly buried. A snow plough and several horses were used for some hours in an ineffectual attempt to get the van out.

In many parts the main road between Preston, Lancaster, and the North was blocked, and, owing to deep drifts of snow, only a narrow track was available for traffic. Vehicular traffic was almost suspended, and several motor-cars which, for a while, fared better than horse vehicles, had to be dug out of the snow. Boxing night, at Ripon, Sir John Barran's motor-car became embedded in the snow. Two motor-cars stuck in the snow on the moors near Inverwick, Berwickshire, and the occupants took five hours to walk a distance of three miles against the storm to a farmhouse. In North Staffordshire motorists got embedded in the snow, and in several cases the cars had to be dug out.

ON the 17th inst. a large sale of Darracq cars will be held at the Motor House in the Euston Road.

## THE PITTLER HYDRAULIC TRANSMISSION FOR MOTOR-CARS.

CONSIDERABLE interest has lately been aroused in a somewhat novel system of hydraulic transmission of the engine power to the road wheels of a motor-car, on which Herr von Pittler, of Leipzig, has been at work for some years, and which he has now brought to such a state of perfection as to permit of it being put on the market as a practicable idea. Various references to the new departure have from time to time appeared in the German automobile journals, but the

Figs. 1 and 2.—Elevation and Plan of Car with Pittler Hydraulic Transmission.

information given has been of such a brief and incomplete description that we have preferred to delay reference to it until such time as something of a definite nature could be given. Our silence can, however, now be broken, for on Monday last we had an opportunity of inspecting a working model of the hydraulic pump and motor invented by Herr von Pittler, which has been brought over to this country by Mr. Chr. Lorenzen, hitherto connected with the Beaufort Motor Company, Ltd., but who is now largely devoting himself to the introduction and application of the Pittler system in Great Britain. Even now, however, it is deemed too early—mainly owing to questions of patents—to make known the full details of the mechanism employed, so that we have first to explain that while Figs. 1 and 2 show the general arrangement as applied to a motor-car, the views given in Fig. 4 are reproduced from photographs of an early form of the Pittler hydraulic pump, and are used only to show the principle on which it works, this principle being still retained in the latest apparatus, in which, however, the scope and capacity have been increased, necessitating a fresh design.

Referring to the illustrations (Figs. 1 and 2) showing the elevation and plan of the chassis, it will be seen that while the engine A is retained in the usual position, the clutch, gear-box, and the system of transmission between the latter and the rear road wheels—either side chains or cardan shaft—as well as the differential gear and pedal-operated brake, are all dispensed with, their place being taken by an oil-pump or compressor B, and two oil-driven motors D contained in the rear axle casing, connection being made between B and D by a system of pipes. It is by the use of the two motors D that a differential is rendered unnecessary, the spindle of each motor being connected through a universal joint to one half of the rear live axle, as shown in Fig. 3. Dealing first with the oil pump or compressor, and bearing in mind the reservation we have made with respect to the illustrations, it will be seen that the pump spindle carries at its centre a disc, on which four diametrically-opposed slots

are formed, and in which what are termed sliding pistons, consisting of machined metal bars, are free to move axially—that is, to and fro, parallel with the spindle. This movement is controlled automatically by the specially-shaped internal surfaces—forming variable inclined planes—of the extension of the side walls of the pump casing, the motion being such that when the pump spindle is rotated by the engine in the direction of the hands of a clock, the space between the sides of the central disc and the specially-shaped walls of the casing becomes, for a portion of the revolution, smaller on the left hand side, and on the right correspondingly and proportionately larger, the pressure on both sides of the slides being thus balanced. In action the piston sucks oil into a gradually increasing chamber, and forces it under great pressure through a gradually decreasing chamber into the delivery pipe. The to and fro motion of the sliding pistons is arranged in such a way that they follow one another up, so preventing any dead point, and giving a steady flow to the oil. The design of the oil motors on the axle is very similar to that of the compressor—the principle on which they operate is the same, although their capacity is collectively eight times greater.

As already mentioned, the full details of the pump B (Fig. 1) now used have not yet been made known. We learn, however, that it has a variable output divided into several units. Although not the actual figures, we may take one of three units, which may be of equal or of different volume. On starting the car from rest, when the resistance is, of course, at a maximum, the whole power of the engine is concentrated on one of the units, so that the pressure of the oil is greatly increased, although the rate of flow is slow. As the resistance decreases another unit of the pump comes automatically into operation, the pressure being correspondingly reduced and the speed increased, the process continuing until all the units are in operation, and, with the three-way cock full open the car is travelling at full speed. *Vice versa*, as the resistance increases the units gradually drop out of action one by one, so reducing the speed of the flow but rendering the pressure much greater until the power of the petrol engine is all concentrated on one. A pedal can also be provided whereby the number of pump units in action can be regulated as desired, and the power exerted by the oil motors varied independently of the three-way cock C (Fig. 1). The latter serves a manifold object: it can be controlled either by a pedal or a lever on the steering column, and by its means the flow of oil to the motors D, and consequently the speed of the car, can be regulated, the oil after performing its work finding

Fig. 3.—Part Sectional views of Rear Axle with Pittler Transmission.

its way back to the compressor. As the cock is closed a braking effect is also obtained, the degree varying in accordance with the position of the tap, the sudden closing of which would be sufficient to lock the rear wheels, owing to the compressing action of their motors on the oil in the pipes to the rear of the cock. Finally, the latter can be turned to a third position, in which the flow of the oil both through the compressor and the motors—which are all arranged to run equally well in either direction—can be reversed, causing the vehicle to travel in a backward direction.

While the actual working pressure of the oil varies from 375 to 1,800 lb. per sq. inch, the piping employed in connection with the system is capable of withstanding 4,500 lb. pressure, or just over 2 tons. Should, however, the resistance to the oil pressure become too great, the oil flow can be by-passed in the piping by means of a safety valve provided in connection with the compressor. Ordinary lubricating oil is employed in the transmission system, a small quantity of glycerine being added to prevent any chance of the liquid freezing in extremely cold weather. The amount of oil contained in the pump, piping and motors, in the case of a large car, is, we are informed, from 2½ to 3 gallons. On the question of the heat generated in the oil and the consequent loss of power, Mr. Lorenzen informs us that this does not exceed from 20 deg. to 27 deg. F. above that of the atmosphere, this result being achieved by the relative slow rate at which the oil is circulated. As will be seen, the pump or motor are not dependent for their action on valves, nor is there any external mechanism. Furthermore, no stuffing boxes are needed or used, one end of the pump being closed by a "capsule" and the other made oil-tight by a hardened steel disc, which is held tight by the internal pressure against the end casing. Working in oil as they do, the pump and motors require no attention as regards lubrication, and it is claimed

Fig. 4.—General and Detail Views of Pittler Oil Compressor.

that the wear is inappreciable; in fact, it is intended to guarantee them for a period of five years.

Extensive tests, when working with a pressure as high as 1,500 lbs. per sq. in., are stated to have shown the system to have an efficiency of 92 per cent.; that is to say, all but 8 per cent. of the power taken to drive the pump and motors was given off by the latter, and this with a smoothness and noiselessness of action that has probably not hitherto been obtained in petrol cars. Another feature of the arrangement is the relatively small dimensions of the pump and motors, while the weight does not exceed that of an ordinary change-speed gear-box. We understand from Mr. Lorenzen that a motor-bus, in which the hydraulic system of transmission will be fitted, is in course of construction, and is expected to be running in London in about six weeks. In this the oil pump will be located close to the rear axle, thus reducing the length of piping, the engine driving the pump through a long shaft.

While we are not so optimistic in our views of the new system as to consider it is entirely going to supersede the present methods, yet there can be no question that it is in the line of progress, and will undoubtedly take a prominent place in automobile construction in the near future. It is, however,

not merely in connection with motor-cars that the Pittler arrangement can be employed; it is also contemplated to utilise it as a rotary steam engine, in which in the one casing the full expansive force of the steam can be taken advantage of. The system, too, is one which can be adopted in all cases where power is required. As we have already mentioned, Herr von Pittler has been engaged on its development for several years; it has, however, now been taken up in Germany by a powerful syndicate of engineers and capitalists, and we understand that a company is also in course of formation to acquire the British rights. It is not proposed that the new concern shall build motor-cars, but only the compressors and motors, and to supply the same to automobile builders and other users, and also to grant licences for their manufacture under royalty. In conclusion we may add that the chassis fitted with the Pittler hydraulic transmission will probably form one of the novelties at the forthcoming Exhibition at the Agricultural Hall.

### SOME USEFUL NOTES.

MISFIRING sometimes occurs with magnetos when the spark is advanced too far, i.e., if the spark happens to be advanced a little further than usual. This difficulty is usually remedied by bringing the platinum points just a shade closer together.

WHEN a valve has been ground a sufficient number of times to allow the face of the valve to get much below the edge of the seat, it is time to renew it, as under these conditions there is a tendency on the part of the valve to stick in its seat and fail to open on the suction stroke of the motor.

THERE are some really good detachable non-skids on the market, and if used properly they give little or no trouble. Tyres fitted with a detachable non-skid device of the "Durandal" type should always be kept well inflated, and the security bolts should also be screwed down tight from time to time.

MANY motorists have trouble with their acetylene lamps merely because they will not give them the comparatively small amount of attention necessary to keep them clean and in proper working order, the lamps and generator being often blamed when they are not at fault. Passages must be kept clear, old carbide should not be allowed to accumulate, and the glass and reflector should be well polished.

THE function of sight feeds is to enable the motorist to tell at a glance whether the lubricator is working properly. In many cases, however, a row of sight feeds is so located that it is impossible to see what is going on in it except by close inspection when the car is standing still. Very often a strip of white cardboard behind the feeds will make the matter much easier, and, in fact, there are several lubricators on the market whose makers have grasped this idea, and furnish a white enamelled metal strip, which is screwed to the dashboard behind the sight feeds.

IN the regular use of a car there usually occurs a very gradual loss of compression, the progress of which is not at all evident to the sense of feeling, when starting the engine up by the ordinary handle, because the change is so slow. The piston rings wear so that their ends do not come together, they lose their resiliency or are stuck in their grooves by an accumulation of carbonized oil. There is also a tendency for valves to gradually become leaky through long use. The exhaust valves particularly are likely to become warped by the intense heat of the escaping charge or to scale or pit, and thus in time to seat imperfectly. All these actions result in a lack of tightness on the part of the cylinder, and, while the volume of gas drawn into it during each suction stroke is as large as ever, there is an escape of mixture during both the compression and exhaust strokes, a reduction of the pressure at compression, a corresponding reduction of the explosion pressure and a diminution of power generated during the cycle.

# The Paris Motor-Car Exhibition.

(Concluded from page 974.)

The Scene outside the Grand Palais the day following the closing of the Salon.

THE Ninth Annual Paris *Salon* was brought to a successful conclusion on Sunday, the 23rd ult. Throughout the day the huge Grand Palais was packed with visitors, and in the evening great interest was shown in the Tombola. It may not be generally known that every visitor to the show received a numbered ticket entitling him to participate in the draw for the hundred or so prizes—ranging from a motor-car to a repair outfit—which are annually offered by various firms in connection with the exhibition. We have not space to print the whole list of prize-winning numbers, but, in case some English visitors hold the lucky numbers, we give the first six:—

No.	Winning No.
1. De Dion Light Car ... ..	103158
2. Galliette Electric Voiturette ... ..	49606
3. Cottureau Bicycle ... ..	189573
4. Plasson Bicycle ... ..	377829
5. Globe Bicycle ... ..	491710
6. Bath Heater ... ..	140388

## The F.N. Car.

A newcomer from Belgium was the F.N. 12-16-h.p. four-cylinder car shown by the FABRIQUE NATIONALE D'ARMES DE GUERRE, of Herstal, Liege, whose F.N. motor-cycles are well known in England. The general arrangement of the car is on the usual lines of live-axle vehicles; the more noteworthy characteristics are found in the engine, the crank shaft of which is *desaxé*; the base chamber is of cast iron instead of aluminium, as usual; it is so arranged that the lower half can be removed without disturbing the bearings. The clutch is of the leather-faced cone type, while the three-speed change gear is controlled by a "gate" lever and gives a direct drive on the top speed.

## The Delahaye Cars.

Among the French cars deserving of more notice than they have hitherto received in this country are those of the DELAHAYE Co. For the 1907 season four sizes are being made—10-12-h.p.

two-cylinder and 18-h.p., 25-h.p., and 50-h.p. four-cylinder. In the larger sizes the engine has the cylinders cast in pairs, with the valves arranged on opposite sides. The exhaust from the engine passes into a water-jacketed collecting chamber, to which the main exhaust pipe is connected. Two systems of ignition are provided—high tension magneto and coil and accumulators. The clutch is of a special design; it is of the leather-faced cone type, the novelty being found in the method of securing the leather to the cone. The latter is cast with eight depressions on its outer surface. The leather band is drawn into these depressions by bolts, the heads of which are below the surface of frictional contact. The two ends of the leather are held by a bolt of special form, the head of which is wider than the others. It is claimed that this method of attachment enables the leather to be firmly held, and to be easily removed for renewal purposes, when this becomes necessary. The change-speed gear is adapted to give four speeds and a reverse, with a direct drive on top speed, controlled by a single lever working in a special form of "gate." The final transmission in the 10-12-h.p. car is by cardan shaft, while the others are driven by side chains. Interest at the Delahaye stand was centred in the chassis of a 45-60-h.p. car built for the King of Spain, in which a number of special features have, in accordance with the order, been introduced. In the first place the frame is higher from the ground than usual, in order to preclude the possibility of the flywheel striking any road obstruction. Secondly, no fewer than six brakes are provided; there is the ordinary foot brake, working on a drum immediately behind the change-speed gear-box; a second pedal actuates a brake fixed in front of the differential casing; while a hand lever controls the usual pair of brakes on the hubs of the rear road wheels; finally, another pair of brakes are fitted to drums inside the sprockets on the differential shaft, these being operated by a lever on the left on

the car and intended to be controlled by the Royal owner of the vehicle. Furthermore, the steering has been rendered extraordinarily safe, cross connecting bars being provided both in front as well as behind the front axle, these being operated from the base of the steering pillar by two separate and substantial arms.

#### Petrol Motors.

Quite a number of firms in France are now devoting attention to the supply of petrol engines for motor-car builders. Notable among these are the ASTER COMPANY, whose produc-

Fig. 65.—Chassis of new Peugeot 10-12-h.p. Car. (See page 972 last issue.)

tions are too well known in this country to need description at this time. Messrs. MARTIN AND LETHIMONNIER, Paris, exhibited the "Sultan" four-cylinder engines, which are made in three sizes—12-16-h.p., 24-h.p., and 35-h.p.; Messrs. BALLOT AND Co.'s productions range from 12-14-h.p. double-cylinder to 40-50-h.p. four-cylinder. M. J. FILTZ, of Neuilly, exhibited specimens of the Filtz two and four-cylinder engines, in which the valves are all located in a chest at the side, and are operated off a single cam shaft. The base chambers, while in one casting, are so made that the oil for the splash lubrication of each cylinder is practically contained in its own receptacle. The BUCHET COMPANY, of Levallois-Perret, which gained a reputation at an early period in the development of automobile engines, as builders of extremely light and powerful motors, exhibited a double-cylinder V-motor for tri-car use, a 12-h.p. four-cylinder motor (70 mm. bore by 76 mm. stroke) with suction inlet valves. Messrs. A. PRIMAT AND Co., of Asnieres exhibited an improved form of their somewhat novel alterno-rotary motor. We give a general view of the 20-24-h.p. four-cylinder engine in Fig. 66. There are altogether four curved cylinders formed in a single casting, within which work pistons of corresponding form, each having its own combustion chamber. Only one of the pistons is provided with a connecting rod, the lower one on the right. The power developed in the other cylinders is transferred to the crank shaft by connecting them in pairs by two bridge pieces, the latter being in turn attached to an arm, the whole forming a kind of I shaped piece which can oscillate on a central spindle. The action in each cylinder is similar to that of a four-cylinder motor, each having its own sparking plug, inlet and exhaust valves. The principal claims made for the arrangement are its light weight and small size, the engine occupying a much smaller space than the usual engine with four vertical cylinders.

#### Shock Absorbers and Dampers.

Shock absorbers for use in connection with the springs of motor-cars were shown by quite a number of concerns. Time was when the Truffault device practically held the field; now there are a dozen or more of arrangements which, although not on identical lines, have a similar object in view. The Edo, which made its appearance a year ago, consists of an archimedean screw supported in a bracket on the frame, arranged to rise and fall in a similar bracket on the axle, the construction

being such that the screw can only return slowly, so preventing any sudden rebounding of the springs on rough roads. The "B P" *amortisseur* or shock damper of Messrs. BERNARD AND PATOUREAU is fitted in connection with the spring shackles, a short rod projecting down from the latter and terminating in a cap, the periphery of which presses against a small air tube held between it and an upper cap. M. SANS, of Brussels, displayed an *amortisseur* which consists of two arms, one attached to the frame and the other to the springs; that from the frame terminates in a small drum, and the one from the springs in what is, practically, a small brake band. As the spring rises, the two parts are brought into frictional contact, allowing the rebounding action to be retarded. The hydraulic principle is employed in the device shown by Dutrieux-Lamelin, of Quesnoy, Nord. Attached to the axle is an arm connected to a form of paddle, perforated and shrouded, which moves radially in a fan-shaped casing set on the frame. The fluid in the casing passes from one side of the paddle to the other through small apertures, diaphragms on one side preventing the rapid return of the paddle after it has been quickly turned by an upward movement of the axle. Other shock absorbers on view included the Catex of Messrs. C. Rey and Co., Levallois-Perret, the René Mullion, the Gardy-Batault and the Dumond. The latter, which is made by M. G. Dumond, Paris, was shown fitted to the Westinghouse cars; it comprises an oil-containing inverted cylinder, supported by a bracket on the rear axle. Within the cylinder works a piston, the upper end of the rod of the latter being bolted rigidly to the side member of the frame.

#### Some Tyre and Non-Skid Exhibits.

The tyre section of the *Salon* formed quite a large exhibition of itself, and it is evidence of the great extent of the French motor industry that so many firms are now catering for the demand for tyres. Among those displayed were the Continental, Michelin, Dunlop, Peter Union, Gaulois, Hutchinson, Le Persan, Clincher, Jenatzy, and Boland. A new comer was seen in the Electric made by the Société Industrielle des

Fig. 66.—The Primat Four-Cylinder Motor.

Telephones, of Paris, in which compressed rubber, made by a special process, is employed, the method resulting, it is claimed, in a tyre which is more durable and less liable to puncture than the ordinary variety. One of the principal novelties in this section of the Show was the tubeless tyre of the Société des Bandages Souples Sidor, of Paris, in which the elasticity of the air is replaced by that of a bunch of specially-made steel springs R (Fig. 67), held in place by strong canvas T, in which light chains Ch are circumferentially woven. The whole of the

foundation of the tyre is impregnated with compressed rubber, and is surmounted by an ordinary beaded-edge cover C, the tread of which is substantially made. The cover is held in place by security bolts and a locking rim A, the latter carrying a wooden ring B which limits excessive deflections in case of violent shocks. The makers of the Sidor tyre claim as a result of exhaustive trials that it is as resilient as the ordinary pneumatic, and that its life is from 15 to 20 per cent. longer.

As in England, considerable interest is being shown in the new Elastes tyre, demonstrations of which were given by the

Fig. 67.—Section of Sidor Tyre.

**FRENCH ELASTES COMPANY.** Another elastic filling for the inner tubes of pneumatic tyres in place of air, on the lines of Elastes, is "Repgerton," made by the REPGERTON COMPANY, of Boulogne-sur-Seine. It is claimed that a tyre thus built up has all the resiliency of the ordinary pneumatics, with none of their disadvantages, the trouble of punctures and inflation being entirely dispensed with. The idea is certainly one which merits attention, as, even if there is a slight loss in resiliency, the freedom from punctures, and the fact that there is no fatiguing tyre-inflating work to do, will more than counterbalance this.

Chrome leather covers are now being largely used in place of those of rubber, this no doubt being an outcome of the use of such leather on studded non-skid bands. The well-known Samson band is being kept well to the front, and appears to occupy a leading position in France as well as in this country. M. E. HERAULT, Paris, showed a non-skid band in which the metal tread is permanently united with the cover; THE ETABLISSEMENTS FOUILLOY, Paris, make the "Royal," and also a detachable band known as the "Fouilloy"; Mr. C. DUFOUR, of Charenton (Seine), manufactures the "Marquis" band; and M. FORTIER-BEAULIEU JEUNE, of Roanne, the "Optima." Other non-skids on view included the Lempereur, Durandal, Houben, De Fornier, Desclee and Beau.

#### Spring and Elastic Wheels.

A number of spring wheels were exhibited in one of the galleries, prominent among them being the Cosset, of the SOCIETE DES ROUES ELASTIQUES, Paris, which is built up of a series of semi-elliptic single-plate springs. Messrs. PELTIER AND THUAULT, of Sceaux-Robinson, France, exhibited a wheel in which a dozen helical springs are interposed between an inner rim, to which the spokes are fixed, and an outer one carrying a solid rubber tyre. To prevent any side deformation of the springs due to the load, half of them are provided with central supports. The wheel exhibited had, we were informed, been used on a car weighing over a ton and which had travelled over 12,000 miles, and which had only required the renewal of the rubber tyre.

The feature of the wheel of LA SOCIETE DE LA ROUE SOLEIL, of Paris, is the elastic rubber hub, which, as will be seen from Fig. 68, consists really of two distinct concentric hubs of steel, the outer one of which receives the spokes, and the inner one of which forms the bearing. The two hubs are connected by a series of rubber washers, which are fixed at their inner and outer edges by means of steel washers and bolts to the inner and outer hubs respectively. The small hub is suspended within the large one, the rubber washers operating exactly like a solid tyre—that is to say, vertically under compression for supporting the weight of the vehicle, and tangentially under traction for transmitting the driving effort. Transverse strength is insured by means of two cross braced parallel metal flanges formed integral with the small hub, and comprising between them only the space absolutely necessary for the motion of the outer hub in a vertical plane. The small rubber washers must support a considerable weight, and they heat, therefore, very quickly. It is with the object of diminishing this heating, which is destructive to the rubber, that a series of washers are employed instead of a single one, provision being also made for the circulation of air between and through the washers. The outer rim of the wheel is fitted with a solid rubber tyre in the usual way.

Fig. 69 gives a sectional view of the wheel made by Messrs. GARCHEY AND CO., of Paris, which has a non-deformable rim and an elastic rubber hub. It is similar in principle to the Soleil wheel, with the difference, that the driving effect, instead of being transmitted by means of the rubber ring, is conveyed by special devices. To the hub is fixed by means of a rim Q a rubber disc K, located between two sheet metal flanges J, fixed to the two ends of the hub, and which carry on their inner side two circular guides G. Within this wheel body is located an annular sheet steel disc P, which, by means of an inner circular flange T, rests on the rubber disc K and carries on the outside the rim to which the solid rubber tyre B is fixed. The driving of the plate P from the hub and the flanges J is effected by means of the bolts A, which are surrounded by rubber rollers

Fig. 68.—Section of Hub of Soleil Wheel.

Fig. 69.—Section of Garchey Wheel.

C, free in the circular openings O near the circumference of the plate P. These rollers at the same time limit the vertical motion of the plate in case of violent shocks. The elastic medium K and the driving media A and C are thus separate and distinct. A motor-bus fitted with the Garchey wheels was used for demonstration purposes during the course of the *Salon*.

**Ignition Specialities.**

One of the striking features of the Show was the popularity of magneto ignition, with the result that both the Simms-Bosch low-tension and the Eisemann high-tension systems, which formerly held the field, and which are still the most favoured types, have now a large number of competitors. In the Breguet high-tension machine shown by the MAISON BREGUET, of Paris,

Fig. 70.—The Bleriot Foot Warmer.

there are four sets of field magnets mounted in the form of a hollow cylinder through which the armature with four pole faces rotates on ball bearings. The armature has a primary and a secondary winding, and four distinct breaks of the magnetic field are obtained at each revolution of the armature shaft. A simple form of high-tension distributor is used. It is claimed that, no matter how slowly the armature is revolved through the magnetic field, the spark given off at the plug is always constant in heat and size, so that no difficulty is encountered in starting engines provided with it. The Unterberg magneto of Messrs. UNTERBERG AND HELME, of Carlsruhe, Germany, is of the high-tension type, the novelty lying in the fact that it is provided with a spring device, by means of which on starting the engine the armature is rapidly rotated to give the necessary spark. Once the motor is in operation the spring coupling is automatically disconnected, the apparatus afterwards working as an ordinary high-tension magneto. Other magnetos on view included the Nilmeli of Messrs. Bassée and Michel; the Kesselring, made by Messrs. F. Kesselring and Co., of Schaffhausen, Switzerland; the Hydra; the Nieuport of M. E. Nieuport, of Suresnes; the Lacoste, of Messrs. J. Lacoste and Co., of Paris, and the Gianoli, of M. L. Gianoli, of Paris. Coils, accumulators, contact makers, &c., were shown in almost bewildering variety, while sparking plugs, both with mica and porcelain insulation, appeared to be as numerous as the different makes of cars, old friends being seen in the Luthi, Benoist, Dary, Oleo, Hydra, and Pognon, the latter being now entirely controlled by Bougie Pognon, Limited, London.

Among the novelties in the ignition accumulator section was that known as "L'Energique," shown by Messrs. COMMELIN, VIAU AND Co., Paris, and for which many advantages are claimed. It is stated that it may be charged and its acid solution poured off without in any way disturbing the charge, which allows for easy transport and a great reduction in weight for carriage. With or without its acid, it is said to retain its charge indefinitely, and it is claimed to be proof against short circuits. For exciting it requires a compound stick to be added to each cell, each of which sticks is capable of releasing a given portion of the charge, and when that has been consumed the cells retain the balance of charge until other sticks are added, to the full capacity of the accumulator. It is further claimed that the voltage is quite regular, and is maintained until the cell is fully discharged. Each cell contains two peroxide of lead positive plates, and a basket-shaped negative plate of lead and antimony.

**Miscellaneous.**

There was hardly any component part of a motor-car which was not exhibited in great variety, steering gears, lubricators, silencers, water circulating pumps, radiators, all coming under this heading. Headlights and lamps, too, were displayed in all sizes and shapes by an increasing number of firms. At the stand of Messrs. DUCELLIER we met Mr. André Godin, the

British agent, who pointed out to us the new models of the well-known Ducellier lamps, both of the acetylene and paraffin variety. A feature of the latest type of generator is that provision is made for cutting off the water from the carbide at any time, and the generator kept charged for use when required. Another new lamp shown is provided with a duplex flame. M. L. BLERIOT, represented in this country by Messrs. WELDEN AND BLERIOT, had, as usual, an extensive display of lamps, the new features of which have already been dealt with in the *M.C.J.* The latest introduction by Messrs. Bleriot is a chaufferette or foot warmer, which is arranged to be fitted in connection with the engine cooling water circulation. As will be seen from Fig. 70, the water is taken to the warmer by a branch pipe from the top of the motor, and back to a junction near the pump. The chaufferette is made of copper, and contains an incongealable liquid, so that it may be used in the coldest weather. The arrangement is well adapted for use in landaulets and other covered cars.

**Some British Accessories.**

Among the British exhibits in the accessory section we noticed the speed indicators, motor watches and clocks, &c., of Messrs. S. Smith and Sons, London, the multiple disc clutch of the Hele-Shaw Patent Clutch Company, Liverpool, the Stepney spare wheel of Messrs. Davies Brothers, of Llanelly, and a large array of motor components and specialities, including the Harvey Frost vulcanizers, by Messrs. Brown Bros., Ltd. The Renold, Brampton, and Coventry motor-chains were also to the front, not only at the stands of the respective French agents for the same, but also on many of the cars on exhibition.

**The Grouvelle-Arquembourg Specialities.**

Messrs. GROUVELLE AND ARQUEMBOURG, who are the largest makers of radiators in France, again drew attention to their combined water tanks and ribbed-tube coolers, which are made in a variety of forms to meet the desires of manufacturers requiring a shape that will give a distinctive appearance to their cars. A year or so ago the honeycomb radiator gave signs of sweeping the board, and it is to the competition of the *nid d'abeilles* that the great improvement in the ribbed-pipe variety is due. The result is seen in what is known in France as the *cloisonne*

radiator, which is ousting the honeycomb form. Other specialities of Messrs. Grouvelle and Arquembourg include centrifugal water-circulating pumps, radiator fans, the G. A. carburettor, which has already been described in the *M.C.J.*—a remark which also applies to the Girip tyre inflator—a device by means of which the tyres are automatically inflated with the exhaust gases of the engine, which, before entering the inner tube, are passed through a small purifier. The firm also showed a chaufferette, or foot-warmer, an arrangement which will be greatly appreciated by those motorists who use their cars as

Fig. 71.

much in cold as in warm weather. It consists of an oblong box with stamped brass top, which latter is intended to be fixed in and level with the floor of the rear part of the car. The foot-warmer can be operated either by means of a branch from the pipes of a pump-driven water-circulation system or from the exhaust. Provision is made that a steady temperature is maintained in the device, which can be put out of operation at any time by means of a small valve. Another interesting apparatus is a speed regulator; this consists of a throttle valve in conjunction with which is a diaphragm acted upon by the suction of the engine; in conjunction with it push buttons are provided on the steering wheel, by means of which all the air can be cut off, or a supplementary air valve opened.

Messrs. BOAS, RODRIGUES AND Co., of Paris, exhibited the B.R.C. lamps and headlights, included among which was one with a double burner, arranged to give either a large or small flame according to whether one is driving in the country or in town.

## Automobilism in 1906.

**P**ROGRESS has been the keynote of the Automobile Movement during the year just closed, and the signs of the times which were noted in our Review of 1905, a twelvemonth ago, have been emphasized by the events of 1906. In fact, there has been a roseate hue in every aspect of the Motor Car World—financial prosperity was reflected in the state of employment in the factories of the firms and companies whose success has given the industry a standing in the commercial world; municipal recognition has been seen in the provision of notice boards, &c., in many towns, and the general content with the existing regulations in place of the objectionable recourse to restricted speed limits once threatened in several places; and legislative sympathy has been shown by the disposition in all quarters to accept the reasonable findings of the Royal Commission and ignore the inflammatory diatribes of the Highways Protection League and other bodies that have sought to alarm the public with statistics of the killed and maimed culled from the columns of the sensational Press.

In looking back upon the twelvemonth the issue of the Report of Viscount Selby's Commission stands out as an event of more than usual importance, for it is generally regarded as likely to guide the policy of the Government in the new legislation shortly to be produced. This proposed the abolition of the present general speed limit and the institution of other limits in certain districts; the allocation of the revenue from the taxation of cars to the improvement of roads under the direction of a Central Department; sundry alterations in licence plates; the possibility of the conviction of owners of cars as aiding and abetting offences when with their drivers; the simplification of the law with regard to manufacturers' marks; the increase of taxes on automobiles, and a discretionary power to magistrates as to the endorsement of licences. Later in the year, during what is known in the general newspaper world as the Silly Season, a certain journal gave credence to the rumour as to there being a likelihood of taxation by horse-power being proposed by the Government in the new legislation. The Royal Commission had specifically reported against the substitution of the horse-power system as a basis of taxation; but, despite this, the idea was revived, entirely supplanting the Sea Serpent story for the time being. It is understood that some motorists went so far as to append their signatures to a declaration against the notion, and that documentary proof of this remains in Coventry unto this day. Anyhow, the absurdity was dispelled by Mr. Walter Runciman, M.P., at the Motor Union gathering in November, since when the motor world has been regaled with a succession of protests against the cynicism of the worldly Press.

An interesting official recognition of the motor-car was made in August when the Motor Volunteer Corps were transformed into an Army Motor Reserve, which has already justified the change, giving the new arm of the service a prestige which could not be obtained under the old dispensation.

Club life has been well developed during the year and

close upon 15,000 motorists are now reckoned in the membership of the four score and more clubs that watch the progress of the movement, while the work of the Motor Union in focussing the opinion of the automobile world at its National Conference in November, the efforts of the Automobile Association to render the roads safe from the trapping activities of the police, and the endeavours of the Road Improvement Association to improve the condition of the roads, are all worthy of mention. In the latter direction great success has attended the propaganda against the dust nuisance, and many authorities now recognise the provision of dust-laying preparations and the proper maintenance of the roads as a necessary part of their duty to the community. Mention must also be made of the removal of the headquarters of the Institute of Automobile Engineers from Birmingham to London. The A.C.G.B.I. has been very active in organising the Tourist Trophy Race, which was won by the Hon. C. S. Rolls on a Rolls-Royce car, the Berliet being second and a Darracq third. The Club also carried through a Town Carriage Competition, the gold medals in which were secured by representatives of electric (the Oppermann and the Electromobile vehicles) petrol (Wolseley), and steam (White).

Motor-buses have come much to the front, particularly in London, where the amalgamation of four leading companies is now being effected, and where seven hundred vehicles are in service. The outcry against their noise and smell resulted in the police taking stringent action, drawing several from the road. At Manchester local feelings proved too much for a line of buses that was started, and all the vehicles were withdrawn. Elsewhere, notably at Torquay, private enterprise has succeeded, and steadily the public service motor vehicle is becoming an acknowledged factor in locomotion; the motor-cab is also now coming forward in larger numbers.

Financially 1906 has been remarkable, the many companies now in the industry being well conducted, and their share quotations being a regular feature of the Stock Exchange. The publication of the Daimler, Humber,

Darracq, and Argyll balance-sheets aroused public interest in their doings, and the formation of the Charron and Rolls companies, as well as those to popularise the Stepney spare wheel and the Cave rim, are evidences of the new expansion in the motor industry.

Socially, the year has had its pleasant side, the peripatetic meetings of the Motor Union having given a zest to club life in Bath and other centres, while the Blackpool meeting enabled a combination of sociability and record breaking, in the course of which some good runs were credited to the Darracq cars, Mr. A. L. Guinness' performances on his 200-h.p. machine being notable, as were also those of Mr. Huntley Walker on the 80-h.p. machine. Here, too, recognition may be paid to the advance of the motor-car in other sports than of its own. Never before were so many cars seen at Henley; at Goodwood the Automobile Association's scouts protected its members from the police traps, and at the fashionable Ascot meeting on four successive days the cars present were 420, 441, 747, and 404 respectively.

The above illustration depicts one of the latest six-cylinder Napier Cars fitted with a detachable limousine body so that it may be used for either touring or town use.

When used as an open car, the vehicle is provided with a Cape cart hood so arranged that it can be readily detached. As regards the removable limousine top, great care has been paid to the design of this, so that when in position it is not only perfect in appearance but is as air-tight and dust-proof as a fixed body.

The increasing cost of petrol led to the subject being reviewed by the Motor Union at one of their provincial meetings and the appointment of a Fuels Committee to take the evidence of experts and come to some conclusion as to the possibility of further enhanced prices being charged. It was also charged with the task of ascertaining the value of likely alternatives, and the evidence on this point, which was published in the *M.C.J.* of the 8th ult., is typical of the practical way the matter has been handled. It is to be hoped that the thoroughness with which the committee has initiated the matter will be maintained, and that the results will be of a really useful character.

Simultaneously with the development of the motor-car has been an improvement in the roads of the country—one of those results of the services of the new locomotion which must be reckoned as a national advantage. Many districts in the south have adopted some of the new dust-laying materials which have been introduced, and in Surrey, where antipathy to the motor-car seems of a more intensive nature than elsewhere, £2,000 has been expended in experimental work. At Tunbridge Wells the Borough Surveyor successfully treated 10,000 square yards of main road surface with tar, and at Woodbridge, in Suffolk, a treatment of calcium chloride was equally effective. Latterly

## THE WHITE COMPANY.

WHEN Sir Conan Doyle wrote "The White Company" he—ardent motorist though he is—never imagined that that title would become the adopted designation of a concern that manufactures and sells a motor-car of high degree. Such, however, is now a realised fact, and those who have been in the habit of writing to "White Steam Cars" in the street called Kingly, off Regent-street, W., will now please address themselves to the White Company—Mr. F. Coleman still being at the steering wheel for Great Britain. The White steam car is developing a history of its own. Originally produced by the White Sewing Machine Company as a kind of side line, less than 600 examples of a 6-h.p. car were produced in 1901-2. The makers had the advantage of a standardised factory organisation, and in the two years following the output was doubled and the power of the car increased. 1905 was a year of great advance, for over 1,200 of the 15-h.p. cars were turned out, and last year the capacity of the existing facilities was reached with a total of more than 1,500 18-h.p. steam cars. Something had to be done to meet the demand for the 30-h.p. and 20-h.p. machines which are to be the type for 1907, and a new corporation called the White Company has been formed, which will take over the

The New White Steam Car Factory at Cleveland, U.S.A.

similar steps have been taken by Lancashire authorities, and, from the Road Reports published regularly in the *M.C.J.*, it is evident that the importance of the subject is being generally recognised. The Essex, and several other county automobile clubs, have been in correspondence with the surveyors and other officials to secure due attention being given to the trimming of hedges and lessening of the awkwardness of many sharp curves—a useful piece of work likely to increase the safety of our roads.

These few reflections on some of the outstanding features of general interest do not take account of the technical advance, which was, however, so recently detailed in our report of the Olympia and Paris shows. Nor do they recall what we have previously written with regard to the tendencies of the future. But they testify to the progress the industry is making, and the fact that 1906 has been a year of general advance—an advance of so solid a character that we look for its continuance and expansion in 1907, in connection with which we would now wish all our readers a HAPPY NEW YEAR.

STEPS are being taken by the Motor Union to test the legality of the toll charged on the Langston bridge between Hayling Island and Havant.

entire automobile business hitherto conducted by the White Sewing Machine Company. The new concern is organised under the laws of the State of Ohio, with a capital stock of 2,500,000 dols., and is held by the same interests that control the White Sewing Machine Company. The officers of the new company are Messrs. Windsor T. White, president; Rollin H. White, vice-president; Walter C. White, second vice-president; George W. Kelly, secretary; F. M. Sanderson, treasurer. In Cleveland a site of 35 acres has been secured, upon which 11 acres of building are being erected without delay to meet the great demand for the continent of Europe, as well as of America, for the White steam car.

MONTH by month we have recorded the steady increase in the number of automobiles imported into the United States. This, together with the registration of cars taken abroad, has necessitated the occupancy of a bonded warehouse at New York, and the work has now outgrown the capacity of the building. To meet the situation the United States Treasury Department has sanctioned the erection of a large garage specially adapted for the purpose, the necessity for which is apparent when it is said that 95 per cent. of all the motor vehicles taken into the United States are entered at the port of New York.

## THE DURYEA ROTARY VALVE ENGINE.

At the recent Olympia Show we were shown the drawings of a new petrol motor, in which the usual inlet and exhaust valves, together with their necessary cam shaft and operating mechanism, are dispensed with, their place being taken by a rotary valve located in the cylinder heads. Strangely enough, at the exhibition lately held in New York, Mr. C. E. Duryea, of the Duryea Power Co., exhibited a three-cylinder engine on somewhat similar lines. As will be seen from the accompanying illustration, the arrangement comprises a single revolving shaft, driven by a silent chain off the crank shaft, having three approximately flat cuts, which form the port spaces,

Sectional View of Duryea Engine with Rotary Valve.

120 degrees apart, each port space being designed to accommodate one cylinder. The cutting of the ports in the single piece shaft is designed with the purpose of ensuring absolutely correct timing of the valve action. The three cylinders are made in one casting, and have single water-jacketed ports on the underside of the cylinders, each serving both for the inlet and the exhaust. The rotary shaft is adapted to take three positions, each of which—inlet, ignition and exhaust—is shown in the illustration; in the first there is a practically straight and unobstructed passage of the gas from the carburettor to the cylinder through the short cylinder port, with consequent small wall area. The passage of the incoming charge against the hot cylinder head and igniting device is supposed to prevent the mixture from becoming diluted by the residue of the preceding charge. The next position of the shaft is called the ignition position. When at this point the cylinder port is closed and the wall area and contents become very small, while the surfaces of the valve and valve bushing in contact are large. This method is claimed to ensure freedom from leakage, and the position of the motor, inclined, as in all Duryea cars, is such that the piston movement throws any oil that might be on top of the piston into the port, thus lubricating the valve, particularly at the compression dead centre, where the pressure is highest and the need for tight fitting most essential. When the valve is in the exhaust position there is a practically free passage for the escape of the hot charge. The ports are three inches in length, and are designed to operate quicker and quieter than ordinary poppet valves. The valve is kept cool by water passing round the ports as well as through the centre. The valve bushings are removable, so that in case of damage by the presence of any foreign substance passing through the valve and scoring the surface the valve and bushing may be removed without interfering with the cylinder casting. The contact maker is attached to the valve shaft on the outer side of the chain sprocket, while the water enters and leaves at the opposite end. Mr. Duryea has been experimenting with this form of motor for over a year, and claims that it has many practical advantages over the ordinary type of four-cycle engine.

## HERE AND THERE.

SIR THOMAS DEWAR has acquired one of the new 18-24-h.p. Britannia cars.

THE Earl of Onslow is reported to have purchased a 16-20-h.p. Ader limousine at the Paris Salon.

A SPECIAL clutch dressing oil will shortly be put upon the market by Messrs. R. and G. Pullman, Ltd., of Westbrook Mills, Godalming.

THE North Eastern Garages, Ltd., which has branches at Harrogate, York, Darlington and Newcastle-on-Tyne, are sole agents for Fiat Motors, Ltd., in Yorkshire.

It is reported that the Buckeye Manufacturing Company of Anderson, Ind., U.S.A., are building a huge friction-driven racing car for the Florida Beach meeting. The engine will, it is said, be of 250-h.p.

MESSRS. BEMROSE AND SONS, LTD., of Derby and London, have issued a capital series of calendars for the wall, each day's date being torn off as the year advances. Artistic and literary excellence are combined with good printing and clear figuring.

THE COUNTY CHEMICAL COMPANY, LTD., foreseeing the possibilities of a shortage of the supply of carbide, have laid in heavy stocks at their London, Manchester and Glasgow depots, whilst no less than 80 tons are being stored by them at their storehouse on the Manchester Ship Canal, to which 300 tons further will be added in the near future.

ALTHOUGH the fire which occurred at the premises of the Anglo-American Motor Car Co., Ltd., in Heddon-street, W., on Christmas morning, threatened to assume serious proportions and necessitated the attention of thirteen engines, no damage was done to the showroom and workshop, the fire being confined to the upper floors, and Mr. F. S. Bennett informs us that the company is able to attend to the requirements of Cadillac owners without delay.

View showing the Patent Side Swing Parallel Motion Radius Rods, with Elliptic Springs, as fitted on the Arrol-Johnston Landaulet Chassis.

SIR OLIVER LODGE, referring to a three months' residence in Italy at the meeting of Birmingham Law Students recently, said that in the country he found that the rule of the road was in a confused state. The French system had been in vogue, and now the English system was being introduced. The latter prevailed in the towns, and the French system chiefly in the country, so that, having regard to the speed with which the motor-car travelled from town to country and vice-versa, correct driving was often a difficult matter.

A MOTOR ambulance is to be placed on a site near St. Bartholomew's Hospital by the City of London authorities. It will be in direct telephonic communication with fifty-two call boxes.

THE overheating of one of the pipes in the Coronet factory of the Humber Company, at Coventry, is said to have been responsible for the fire that occurred there on Christmas Eve. Despite the serious nature of the fire the management is in no way disconcerted and another factory in the vicinity has been secured so that work is practically uninterrupted. Within a few days the output in cars will be up to its normal state. The result will be that there will be no appreciable effect on the deliveries of the Humber cars.

THE latest production of Reo Motors, Ltd., is a 16-20-h.p. chassis adapted to receive a delivery van body. The steering and control gear is placed well forward in order to allow full advantage to be taken of the length of the frame to fit as large a body as possible.

DURING the last season the demand for "Continental" motor-cycle belts increased, the advantage of these being that they do not require the constant attention that leather belts generally demand.

PENNINGTON, whose brief career in this country will long be remembered, has re-appeared at Milwaukee, U.S.A., where he is reported to be about to produce a 16-h.p. car to sell at £60!

THE offer of some goods stolen from their warehouse to the firm's manager for sale has led Messrs. Bransom, Kent and Co., Ltd., to trace a quantity of motor accessories which had been pilfered from their premises in Great Eastern Street, E.C.

THE present is a seasonable time for drawing attention to a portable smokeless stove which is being marketed by the Domestic Inventions Company, of 119, New Bond Street, W. This is of the well-known upright cylindrical form, and, fed with the "Famed Fuel," will burn for twelve hours without attention. The stove gives off neither smoke nor flame, so that it can be safely employed in any private motor house or public garage. In fact, it constitutes a valuable adjunct to the equipment of either place, giving out a considerable volume of heat at little cost. The "Famed Fuel" is a chemical compound which burns with very little draught and yet gives efficient results. The stoves are made in various sizes, ranging from 3 ft. by 8½ in., giving an approximate heating power of 1,500 to 2,000 cubic feet, to that of 4 ft. by 13 in. with a heating power of from 4,500 to 5,200 cubic feet. Easily regulated, the stoves of the Domestic Inventions Company should prove of service to the many motorists with whom the warming of their motor houses has been a difficult problem.

PRIZES for those engaged in motor body making and the allied trades are offered by the Worshipful Company of Coach Makers and Coach Harness Makers for drawings of a light motor-car body suitable for a medical practitioner, and also for sketches of a three-quarter landaulet motor-car body. These have to be delivered at the Hall of the Company, Noble Street, St. Martin's-le-Grand, London, E.C., on or before April 14th of the present year.

THE Mayor of Coventry, speaking in the local police court, has expressed the wish that "some motorists would have more regard for the public safety."

MR. W. T. BERRY has a motor garage in the High Street, Skegness, and anticipates good business in the year upon which we have entered.

DURING the visit of the South African football team to Manchester a Ryknield motor-bus was placed at the disposal of the visitors by Mr. William Stanway, the Manchester representative of the Ryknield Motor Company.

THE Inland Revenue authorities are reminding motorists that now is the appointed time for taking out motor licences—a fact that should not be overlooked by those liable to the payment of duty.

THE Rolledge Auto Polish is an excellent preparation for cleaning, preserving and waterproofing the leather and enamelled parts of motor-cars. The experience of Messrs. E. Brown and Son in such work is very extensive, and their special polish for motor-cars is giving extremely good results.

MESSRS. WALLACH BROS., whose name will be familiar to our readers in connection with the Stern-Sonneborn Oil Company, have removed from 57, Gracechurch Street, to Royal London House, Finsbury Square, E.C.

THE first provincial gathering of the Motor Union for 1907 will take place on Whitsun Saturday, at Lincoln, on the invitation of the Lincolnshire Automobile Club, which is arranging an interesting programme, further particulars of which will be published in our columns in due course.

AMONG the handy little tools lately introduced by Messrs. G. T. Riches and Co. is a small hand-driven grinding machine, arranged to be fixed to a bench; it will be found to be extremely useful in small private workshops or garages, as will also the bench drill supplied by the same firm.

DURING the past two years and nine months we have had fitted to the rear wheels of one of our small cars a pair of Palmer cord plain tread tyres, 750 by 90, and during this period have covered about 10,000 miles thereon. The tyres now show very little wear beyond a thin skin of rubber peeling off on the tread. There are no gasches or cuts and we have never suffered a puncture.

MESSRS. JARROTT AND LETTS, LTD., have sent us a photograph of a handsome 24-h.p. De Dietrich limousine they have recently delivered to Sir Robert Harvey. The vehicle is upholstered in fawn cloth, with silk blinds, and has comfortable inside seating capacity for five people. It is fully equipped for touring, having a luggage box at the back, a tyre box on the roof, and mahogany boxes on each side step.

MESSRS. MILLINGTON AND EVERITT, of Free Church Lane, Cambridge, have lately introduced a handy little tool for assisting grinding in exhaust valves. The valve is placed in its seating with the necessary grinding powder, the tool is slipped on to the stem, and, by means of a slot in the under-part of the tool which engages with the small cotter in the valve stem, is made to rotate, enabling the valve and its seating to be trued in a minimum of time.

is hereby entitled to drive a Motor, whether he understands it or not, to the common danger of the Public whether they like it or not.

#### A few of the Rules to be observed.

No two Motors going in the SAME direction, and at the SAME pace, to pass one another.

No Petrol to be scented, its natural odour being ABLE sufficient.

Horns to be blown in VIOLENT jerks as it stirs up the liver and is consequently conducive to health.

Should the Motor break down in a lonely spot the language used to be optional.

All Foot Passengers and Policemen to be CAREFULLY Driven into, as there are plenty more, especially the latter, the world is full of them.

Each Motorist to bury his own dead.

(Signed) E. RUNEMDOWN.

Sec. Sec. to "The Automobile Deadly Tragedians Society."

Above we reproduce one of the Christmas greeting cards with which we have been favoured. It is unique in its way—although we would dissociate ourselves from its rulings.

## CONTINENTAL NOTES.

### An Italian Touring Contest.

At the last meeting of the Automobile Club of Turin it was decided not to hold the annual hill-climb up Mont Cenis, mainly on account of the difficulty experienced in obtaining the Government sanction. In its place a reliability trial of touring cars of from 12 to 16-h.p. is to be held, from the 18th to the 23rd June next. The competition will consist of five daily runs of about 220 miles, all starting and finishing in Turin. All repairs and adjustments are to be made on the road, and minimum and maximum speeds of respectively 22 and 25 miles per hour will be required. On the last day, those cars which have not been penalised in any way will be subjected to a hill-climbing test.

### Encouraging Drivers.

With a view of encouraging cleanliness and neatness in *mecaniciens* and motor-car drivers generally, the "Auto," of Paris, is organising an elegance and appearance competition for the 20th inst. There will be four categories:—1, electric vehicles; 2, petrol and steam cars; 3, motor-cabs; and 4, delivery vehicles; which are to parade in the Bois de Boulogne. There both the cars and their drivers will be inspected by the jury, who will allot two cards to each competitor—one for the car and one for the driver—the number on the same varying, in accordance with their decision, from 0 to 10. Drivers gaining from eight to ten points will be awarded a silver medal, while bronze medals will be given to the others who secure not less than six marks. As regards the cars, the awards will not be based on the luxurious design and finish of the same, but on the way they have been looked after by the driver, silver plaques being given to those securing eight points and over, and bronze plaques to those gaining at least six marks.

### The End of the Paris Salon.

Social proceedings in connection with the *Salon* were wound up by a great banquet held at the Grand Hotel, Paris, on the 24th ult., at which the President of the French Automobile Club, Baron von Zuylen, the Minister of Commerce and Industry, the former President of the Republic, M. Loubet, and nearly all the prominent men and leaders of the automobile world were present. Numerous speeches were made, but the topic of greatest interest, and which most of the speeches favoured, was that of automobile races in the future.

### The Motor-car in Military Operations.

The Automobile Club de la Sarthe, of Le Mans, France, is about to undertake a noteworthy experiment to demonstrate the value of the motor-car in time of war. Presuming that a mobilisation order has been issued by the Minister of War, an effort is to be made to convey the order by motor-car from Paris to Le Mans, and to distribute copies of the same in the 385 communes of the Department all within a period of twelve hours. At Le Mans a battalion of cyclists and motorists will await the arrival of the order from Paris, ready to convey the copies of the same to the outlying towns and villages and obtain a receipt therefor from the local authority.

### Another Airship Prize.

Following the example of the "Daily Mail," M. Marquet, the leaseholder of the Ostend Kursaal, has decided to offer a prize of £8,000 for an aeronautical race between Ostend and Paris. Both aeroplanes and dirigible balloons will be eligible for the contest, which has been set down for any Sunday in August, 1908, or for the Sundays in every August until the prize is won. The sole conditions are that the distance be covered within twenty-four hours, and by no other means than propulsion from the car. The Paris "Matin" has been entrusted with the organisation of the contest.

### The Touring Car Race for the Kaiser's Prize.

The race for touring cars for the Kaiser's prize, which is to be run off on June 14 next, promises to be an exceedingly interesting event, and one of a thoroughly international

character. So far no less than ninety-two entries have been received, in which total Germany is represented by thirty-one cars, France by twenty-two, Italy by twenty, Belgium by nine, Switzerland and Austria three each, and Britain by four, the latter comprising three entered by the Daimler Motor Company, Ltd., Coventry, and one by Messrs. S. F. Edge, Ltd.

### The Mercedes Six-Cylinder Car.

We are able this week to publish an illustration of the motor of the new Mercedes 70-h.p. six-cylinder car. As will be seen, the cylinders are cast in pairs and have the valves arranged on opposite sides, and the ignition is by both high and low tension magneto. The flanges carrying the ignitors for the low-tension system are smaller than hitherto, and are now attached to the cylinders by two bolts. The cam shaft gear wheels are enclosed in an aluminium casing immediately beneath the fan behind the radiator. The crank chamber is divided into two halves; the upper portion being provided with detachable covers to permit the big ends to be inspected. The lower portion of the base chamber, which forms an oil well only, is held up to the upper section by bolts, and can be removed without disturbing the crank shaft or its bearings. The carburettor is of the improved "Soden" type, referred to in connection with the 1907 35-h.p. model in our report of the Olympia Show. The diameter of the steering wheel has been increased, the segment on which the control levers work being independent therefrom

The New Mercedes 70-h.p. Six-cylinder Engine.

The change-speed gear provides four forward speeds and a reverse, with direct drive on top gear. The old wire rope connections from the side lever to the rear brakes have been discarded for rods located within the frame.

### Miscellaneous Items.

A course of weekly lectures on motor-cars and their component parts is being inaugurated at the University of Bordeaux.—At a recent meeting of the Société des Voitures Electriques Krieger, it was announced that the company had orders on hand for 1906-7 for 257 vehicles. The manufacturing programme for 1907 comprises 450 cars, of which 300 will be electrical and 150 will be of the petrol-electric type.—The King of Italy is offering a silver cup as a prize for a special race to be held during the Brescia week.—It is proposed to hold an automobile week, at Hyeres, in the south of France, next spring.—The Prince of Schwarzburg Sondershausen, in Thuringia, is reported to have issued a decree excluding motor-cars from his Principality while he himself is within its borders.—The Grand Prix de l'Automobile Club de France for the best decorated stand at the recent Paris *Salon* was awarded to the Brasier Company.—The Mont Ventoux hill climb will, it is reported, not be held this year.—It is stated that a company is being formed in Vienna to establish works in Austria for the construction of motor vehicles on the Fiat system.

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

#### FOUR v. SIX CYLINDER ENGINES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with considerable surprise that Mr. Jarrott is still seeking to draw me into a correspondence with reference to the merits of six v. four cylinder cars. It has seemed to me that the day for this controversy has entirely passed. There are now one hundred manufacturers copying Mr. Napier's six-cylinder principle, and it is quite immaterial to me whether one concessionaire more or less believes in the six-cylinder principle.

If Mr. Jarrott's four-cylinder principle is so much better, then I am surprised that at Shelsley Walsh, the six-cylinder Napier, with a cylinder capacity of only 471 cubic inches, completely paralyzed the two De Dietrich cars which ran, one with a cylinder capacity of 487 cubic inches, and the other with an enormous engine having 732 cubic inches, driven by Mr. Jarrott himself. If for a competition of this sort he could not with this huge engine beat the little six-cylinder Napier, I am quite satisfied that he cannot beat it for all round general points, such as quietness and smoothness of running, ability to run fast and slow on the same speed without using the clutch, and general durability. It is no use for him, however, to continually flog a dead horse, viz., the powerful four-cylinder car; it has been a splendid friend to all automobilists, it will be still for small vehicles, but for big cars with powerful engines for those who require the latest and best mechanical device, the six-cylinder has come to stay, and

Caricatures by "Mich." of the "Auto." of some French motorists at the Table of Honour at the Banquet given by the A.C.F. last week to celebrate the closing of the Salon. Reading from left to right they are: The Marquis de Dion; M. Ruau, the French Minister of Agriculture; M. Loubet, the ex-President; M. Gustave Rives; M. Doumergue, the Minister of Commerce; the Baron de Zuylen; Commander Lasson; and General Dalstein.

I am only sorry that Mr. Jarrott should be lagging behind in his ideas of modern motor-car progress.

I am glad to hear that he does consider it is possible for good motor-cars to be manufactured in Great Britain, and that when he wrote some two years ago saying that motor-cars manufactured in this country were not as good as many of their foreign rivals, he did not really mean that we could not manufacture them in this country. Personally, I cannot understand his subtle difference of what he actually said in words and what I understood him to say. They both seem the same to me. However, it is quite satisfactory to know now that even Mr. Jarrott agrees with me that Great Britain can make perfect motor-cars. The next thing will be when he agrees with me that six cylinders are better than four for powerful cars. It is something to have converted him to the British manufacture idea.—Yours truly,

S. F. EDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having noticed a letter in a recent issue of the *M.C.J.* respecting the comparative qualities of four and six cylinder cars, I should like to give an account of my own personal experience. During the last five years I have driven several of the best-known makes of cars, including some fitted with six cylinders, and for my choice, were I about to purchase a new car, I should without hesitation select one fitted with a good four-cylinder engine. From my experience of automobile mechanism, I am quite prepared to argue in favour of any well-designed four-cylinder chassis, providing the balancing of the engine is as near perfection as possible.

Now, although I do not for one moment contradict the statement that a six-cylinder car is slightly more flexible than one fitted with four, I merely wish to claim a few advantages for the latter. First of all, I am inclined to say there are few who would venture to argue that the extra complications prevalent in six-cylinder cars, and the very few advantages which they possess, are really worth the increased purchase price fixed by the makers. The last car I drove was a four-cylinder chassis of 35 brake horse-power, built by a well-known foreign auto-

mobile firm, and without exaggeration I can say that this car was more reliable, economic, lighter on tyres, and satisfactory in every way than any six-cylinder car I have ever driven. On top gear this car could be driven at about six or seven miles an hour without slipping the clutch, and was extremely free from vibration, and I feel sure that at present the vehicle for the motoring public is "a car with four cylinders."—Yours truly,

RUPERT FOULKES.

#### WANTED, A PARAFFIN CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your readers inform me through the *M.C.J.* if they know of a good carburettor for using either paraffin oil or petroleum? If there is one on the market, what is the price, and what are the arrangements for heating the oil to the requisite extent? Being much heavier oils than petrol, some method of heating must be necessary. Can such carburettor be made to start with using petrol and then turning on the heavier oils afterwards? Full information will be of service to most motorists now that petrol is going up in price, and possibly may, if brought into ordinary use, be a means of bringing down fictitious prices of petrol. To bring a carburettor of this kind into common use, it must be reasonable in price and satisfactory in its working.—Yours truly,

MOTORIST.

[A full description of a carburettor designed to use paraffin as fuel, while starting on petrol, was given in the *M.C.J.* of October 6th last. Full particulars of the device can be obtained from Mr. G. L. M. Dorwald, 30, High Street, Wandsworth, S.W.]

#### THE BROOKLANDS RACING TRACK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In common, probably, with every other motor firm in the kingdom, the Beaufort Motor Company has received a copy of the prospectus of the Brooklands Automobile Racing Club, together with a preliminary

list of the races and an invitation to compete therein. Essentially the club is a private enterprise that by a judicious and even lavish expenditure initially has every prospect of becoming a governing, or shall I say the governing, factor in automobilism. In fact already, before seemingly the ground whereon the track is to be constructed has been cleared, the Automobile Club has delegated to the Brooklands Club a great part of such authority as the former possesses.

Now, Sir, during the last few weeks a large section of the press has been publishing glowing descriptions of the unfinished track and has been wholeheartedly supporting the scheme, but from the trade, upon whose support the success of the Brooklands undertaking entirely depends, has come never a word.

Might I suggest, Sir, that, in the interests of the industry and of the trade, the subject is one eminently worthy of discussion in your columns, and that the views of those who are in a position to enter for and make a success of the races cannot but be of value.—Yours truly,

J. EDGAR LOUND.

#### LIVE AXLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Many an otherwise good car has been spoilt by a defective live axle, and, now that this form of axle is generally admitted to be the most mechanical and the most satisfactory in use, perhaps some of your experienced readers will give their opinions of the various kinds in vogue. What is known as the "Deauville pattern" is evidently favourite. In this, as is well known, the wheels run on sleeves. There are other kinds, of course, such as those on the Aries and Bolide cars. The new Porthos car is rather different in that the interior solid axle is stationary while the sleeves turn the road wheels. What particular advantage can be gained in this method I do not quite see. Then we come to the De Dion axle, which consists of two cardan shafts with the joints on each very close together. This axle has undoubtedly contributed in a large measure to the success of the De Dion cars. In the other types the balance gear is subjected to all road shocks. It seems

ome that the best form of live axle, whether for heavy or light vehicles, is that in which the balance gear is entirely independent of the weight-carrying axle and in which the live axle is flexible without too acute angles being liable to occur from the oscillation of the car.—Yours truly,

E. H. OWEN.

### NON-FREEZING ENGINE COOLING SOLUTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There must be many motorists who have adopted some non-freezing solution for the water circulation system of their engines in winter, to prevent the danger of cracked cylinders. I have seen glycerine, wood alcohol, and calcium chloride all recommended, and as this is my first winter since becoming a motorist, I am somewhat undecided as to which to try. I am sure that there are many besides myself to whom it would be helpful if those who have used any of these solutions would send you the results of their experience for publication in the *M.C.J.*—Yours truly,

NEW BROMPTON.

### MOTORISTS AND HOTELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I feel sure that as the columns of your valuable paper are always open for the ventilation of the complaints of travellers against extortionate charges of some hotel keepers, your readers will perhaps be interested to know of the reception my party received at the Victoria Hotel, Sidmouth, where we arrived in the small hours of Christmas morning. Pressure of business prevented me from leaving London till very late on Christmas Eve, thus causing a correspondingly late arrival at Dorchester, where we were detained for some time while ascertaining by telephone that we could obtain the necessary accommodation at Sidmouth. We hoped to reach the latter place by about midnight, but tyre troubles, due to the great number of patches of sharp flint stones, so delayed us that it was not until after three o'clock on Christmas morning that we arrived at the comfortable and very well situated Victoria Hotel, Sidmouth. There the courteous manager of the hotel, his engineer, and a large staff of servants were awaiting our arrival, and last, but not least, a very much appreciated supper was already prepared. I think that motorists will be interested to know of this civility and attention of the manager of the Victoria Hotel, Sidmouth, to a party of motorists, all of whom were quite unknown to him.

Let me add a word of warning to motorists who meditate touring in that part of Devonshire. Great caution is necessary when descending the very steep hills, especially so at night, as right angle turns at the steepest parts are by no means uncommon.—Yours truly,

H. H. P. DEASY.

### A DARRACQ CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "D. G.'s" query in the last issue of the *M.C.J.*, your correspondent might fit a wipe contact to the present Darracq commutator disc, if he cuts the projecting piece that holds the present blade and substitutes a vulcanite block to hold a stronger blade made out of spring steel. The vulcanite disc should be lined with brass and have a cog on for contact. He will then find the car easy to start and have more power by using good trembler coil and having the engine timed properly.—Yours truly,

G. W. WATERLOW.

### CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A supply of direct current electricity, 200 volts at ten amperes, is available at my house, and I write to ask if you can give me instructions how to charge my ignition accumulators off the same. Thanking you in anticipation.—Yours truly,

R. SINGLETON.

[To charge ordinary ignition accumulators you do not require more than three amperes as a rule, so that ample current will be available and reduction of the voltage from 200 to five volts at the terminals of the accumulator is the chief consideration. To do this it is necessary to pass the current through some resistance, and the simplest form is the incandescent lamp, as it is made to take 200 volts, and by inserting an accumulator in circuit with such a lamp the current is slightly reduced and the accumulator receives the same current through it as the lamp takes, whilst the lamp saves the accumulator from receiving too much current. The necessary apparatus is as follows:—

On a teak base board fit from two to eight lamp holders, the number being dependent upon the charging rate of your accumulators; four lamps of 16-c.p. being required for each ampere of current, so that you would want eight lamps for a two ampere current. These lamp holders must be connected up in parallel and the end connections taken to terminals. The latter will have to be marked positive and negative, after the lamp board has been fixed on the circuit, as it is absolutely necessary for the accumulator to be always connected up so that the

positive terminal is connected to the corresponding positive on the board, and the negative to the negative. A switch should also be fitted, and a safety fuse. The whole apparatus should be made by an electrician, as it is impossible to give full details of what is a simple affair if properly arranged, but far from simple if erroneously fitted.]

### SUBSTITUTES FOR THE HORN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would be glad if some of your readers would kindly give me their experience in the use of sirens working off the fly-wheel, and also of electric hooters. What are the troubles they are liable to and do they often get out of order, and is there much trouble in putting them right?—Yours truly,

A. FIELDING.

### NON-SKID EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter of "C. D. L." in a recent issue of the *M.C.J.* suggests a difficulty which faces the motorist who is just beginning to motor. The number of non-skids, real and alleged, that are now on the market is legion, and who can tell which is the most effective? We have the metal studs and the rubber pieces that project; now I hear of a form of device in which holes of the shape of the rubber studs are cut into the band so that the latter presents a very different appearance to those generally employed.

This plan seems to open up new possibilities, for it must be confessed that makers of non-skid bands have followed each other's ideas with strange similarity, only one or two makers finding original paths of invention. Personally I have been well satisfied with the ordinary type of non-skid—leather band and studs—and my experience has been the reverse of "C. D. L.'s." Used on my car in the greasy streets of London I found the non-skid a safe precaution and cannot understand the cause

The Lost Track.—A Scene in the Highlands.

of his misfortune. Perhaps other readers may give their views on the matter, and I should be particularly pleased to have the opinion of those who have tried the new form to which I have referred.—Yours truly,

A. B. MANNING.

### OVERCOMING VIBRATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My 6½-h.p. Beeston Number car runs practically without vibration up to, say, fifteen miles per hour, but going faster than this the vibration is tremendous. The vehicle goes up most small hills on top speed. How can I make the car go up to, say, twenty miles per hour as well as she goes fifteen? Would a large fly-wheel do this; if so, what size, or what would you suggest?—Yours truly,

ERNEST TAYLOR.

[We very much doubt if a larger flywheel would overcome the excessive vibration our correspondent complains of. What we would suggest is to add somewhat to the counterbalance; but even with this the vibration may not be entirely overcome, owing to the increase in engine speed. Failing this, some of the existing balance might be taken away, but the correct balance can only be obtained by experiment.]

### IMPROVEMENTS IN MOTOR-CAR CONSTRUCTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If those who have been in close touch with the development of the car ever since its inception were to be asked what they considered the greatest improvement brought about in that time, it is not difficult to conceive that the answer would be the betterment of material. It may appear strange at first sight to place this before improvement in construction and design, for material is nearly always to be had of as high a grade as the user is willing to pay for. At least, such is the assumption of the average observer. But five years ago the steels now employed in automobile construction were not to be had at any price. Of course,

there was plenty of good steel available—more than enough of it to build the strongest car that ever ran on wheels, but what of the weight? An increase of dimensions was hardly permissible, for in some of the earlier cars the latter were already in excess of the dictates of reason, yet the parts gave way. What the designer wanted was lighter axles and bearings, gears and shafts, but without an improvement in the quality of the metal composing them it would have been folly to have reduced their weight or size. What single improvement can be compared with this sweeping change that has made the car body what it is? The pressed steel frame has taken the place of cumbersome built-up affairs, the automatic valve has disappeared in favour of mechanical operation, the cardan shaft transmission has produced more silent running, bodies and tyres have been improved, and so with everything else; nothing has been overlooked. But all these are details that would not have helped makers much had not better material made it possible to build a 40-h.p. car of the same weight or less than the 12-h.p. of a few years ago.—Yours truly,

NOVOCASTRIAN.

### PRESSURE FEED FOR CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a distinct tendency, especially as regards large cars to adopt pressure feed in connection with the petrol supply to carburettors. There are, however, several disadvantages inseparably connected with the use of petrol under pressure. In cars with long wheel base it is quite common to find twenty or thirty feet of piping for the fuel system alone. One length of ten or more feet conveys the pressure from the exhaust pipe to the tank; in between there is a valve of some kind which often is the cause of trouble. Then there is the length of pipe from the petrol tank to the carburettor. The tank itself is usually only eight or nine inches above the ground, and as it is rarely protected in any way, it may be damaged or even punctured by stones being thrown up against it from the road. It seems strange that so many makers should use a system which is so awkward and contains so many weak points. If the petrol tank is located in the right place, there is no reason why the spirit should not feed steadily and regularly to the carburettor by gravity. Again, it would be interesting to know how pressure feed compares with gravity from the point of view of fuel consumption. So far as I know, no comparative tests have been made of the two systems. Perhaps the Technical Committee of the A.C.G.B.I. may think well to include such an inquiry in the scope of its labours.—Yours truly,

R. V. PARKER.

### ACETYLENE LAMPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your recent reference to glaring headlights suggests that the care of the lamp is one of the neglected studies in connection with automobilism which might well be considered more thoroughly than is now the case. Because the lamp is not a part of the motor mechanism, some are inclined to treat it with scant courtesy, and even experienced chauffeurs are quite ignorant of many minor methods for improving the light and economising the cost of maintenance.

The other day I was told that several owners of cars are in the habit of dissolving a few pieces of lump sugar in the water used in the carbide generator in order to keep it clean and so enhancing its life. Certainly my own experiments have shown that half a dozen pieces of sugar to a gallon of water do increase the capacity of the latter for absorbing the spent lime and preventing it from clinging to the bottom and sides of the generator. If other readers have heard of equally simple means of adding to the cleanliness or efficiency of acetylene, I, in common with hundreds of other motorists, will be glad to hear.—Yours truly,

T. CAPTEN.

MESSRS. MANN AND OVERTONS, LTD., write:—"A rumour was current about a month ago that M. Brasier had left the 'Société de Construction d'Automobiles Le Treffe a Quatre Feuilles' to rejoin the Mors Company. We beg most emphatically to contradict the rumour, and shall be obliged if you will give publicity to our contradiction."

BROOKE MOTORS.—As there appears to be some misunderstanding with regard to the actual scope of Brooke Motors (London), Ltd., Mr. E. J. Steel, the manager, asks us to state that the position is that they have been appointed the sole selling agents for the world for Brooke motor vehicles and parts thereof other than the commercial type. Messrs. Brooke have decided to devote their factory at Lowestoft solely to the manufacture of cars of the six-cylinder type.

THE PRUNEL CAR.—"P. C." writes:—"I would be obliged if, through the medium of the *M.C.J.*, some reader could tell me the makers of the best and most economical up-to-date automatic carburettor suitable for a 12-h.p. two-cylinder Prunel car."

ON the morning of the 21st ult., between Henley-on-Thames and Hounslow Barracks, one of the drivers of the Electrical and Motor Company, of Bridge Street, Banbury, lost a Stepney spare wheel, size 810 by 90, complete with cover and tube. Should any of our readers have found this the firm at Banbury will be pleased to know and to pay all expenses of its return, &c.

A CORRESPONDENT writes that a temporary repair of a leaky honeycomb radiator can be made by mixing litharge and glycerine to a paste consistency, plastering up both sides of the radiator where damaged, and allowed to dry.

Owing to the pressure on our space several important letters are held over till next week.

## CLUBS AND ASSOCIATIONS.

### LADIES'.

SINCE October the following ladies have been elected members of the Ladies' Automobile Club:—Mrs. Baldock, Miss M. Hoadley Dodge, Baroness von Eckardstein, Miss Amy Ferguson, the Dowager Countess of Lonsdale, Mrs. W. Madocks, Lady Katherine Morgan, Mrs. Paul Nelke, Mrs. E. Pease, Miss J. F. Schreiner, Lady Scott Gatty, Mrs. H. Stock, Miss M. Walton, and Mrs. D. H. McLean. The course of lectures given at the club last winter by the club engineer proved popular. The committee, therefore, have arranged for a somewhat similar course to start on Wednesday, January 23rd.

### HEREFORDSHIRE.

FROME'S HILL climb will be held on May 3rd, under the auspices of the Herefordshire A.C., when the prizes will include six gold, five silver and five bronze medals and five certificates, as well as a trophy of the value of £105.

Colonel Holden's formula, as adopted by the A.C.G.B.I., will be used for handicapping, and entries will close April 18th. No steam cars are eligible, nor cars of which the cylinder diameter in inches squared and multiplied by the number of cylinders exceeds 125.

The results, it is hoped, will be known immediately after the contests, and the prizes distributed at the dinner held the same evening. Mr. Wilfrid Groom, the hon. sec. of the Herefordshire A.C., Mitre Hotel, Hereford, will be pleased to afford further information to intending competitors.

### SCOTTISH.

THE Scottish A.C. has just selected the following hotels for appointment as official headquarters in the places named:—Alexandra Hotel, Inverness; Marine Hotel, Troon; Dreadnought Hotel, Callander; Alexandra Hotel, Oban; Lovat Arms Station Hotel, Fort Augustus; Caledonian Hotel, Inverness; Grant Arms Hotel, Grantown-on-Spey; Station Hotel, Boat of Garten; Cairloch Hotel, Ross-shire; Royal Hotel, Portree; Tarbet Hotel, Loch Lomond; Royal Hotel, Edinburgh.

ALTHOUGH Mr. G. J. Nearing is resigning the captaincy of the Blackpool Motor Club, consequent on his removal to London to join the firm of Huntley Walker and Co., Ltd., he will retain his membership.

## CASES UNDER THE MOTOR-CAR ACT.

THREE cases of motorists exceeding the ten mile speed limit in Richmond Park have been heard by the Kingston County Bench, fines of £3, £4, and £5 being inflicted.

### IDENTIFICATION MARKS.

AT the Bromley (Kent) Petty Sessions, Charles Cooper, of Carshalton, Surrey, was summoned for driving a motor-car with the front identification plate thereon obscured. He pleaded guilty and was fined 10s. and 8s. costs.

### ROAD REPORTS.

YEovil.—At the last meeting of the Yeovil Rural District Council the surveyor (Mr. J. R. Burnell) presented his estimate for the roads for the year ending March 31st, 1908. He pointed out that every road in the district would require more material. The motor traffic, he said, pulled the roads to pieces everywhere, and during the last month he never knew the roads so cut up. In making his estimate for the maintenance of the main roads, he found it necessary to increase quantities of materials on some of the lengths of roads. He suggested that two steam rollers be hired at once, for he considered that extra material would be required before the winter was over.

LINCOLN.—No special road repairs are to be carried out at Lincoln at present. During the last six months Mr. R. A. MacBair, the city surveyor, has largely extended the substitution of tar for ordinary macadam, but recent weather has delayed the last work in that direction contemplated by the authorities. It will be completed at the earliest opportunity.

PRESTON.—Local discussion is growing in the borough of Preston with reference to the dangerous height of some of the tramway lines above the stone setts that form the roadway. Not only the safety of motorists but that of every other class of traffic is being jeopardised.

PLYMOUTH.—Motorists in the west country will be interested in knowing that no main roads in the borough of Plymouth will be under any extensive repairs for some time to come.

## AN AUSTRALIAN CONTEST.

THE motor reliability contests held about Melbourne from November 12th to the 19th, 1906, resulted in a win by O. Camphin in his 12-h.p. Darracq car, who covered the total distance of 1,011 miles in 39 hours 58 min., and lost only three points, owing to his having been forced to tighten a nut during the first day's run. With this trifling exception, Camphin completed the whole of the six days' runs without requiring to stop once. His car was shod with Continental tyres.

One of the lessons of this test is that low horse-power cars are more suitable for Australian roads. Another is that in many instances cars built for the perfect surface to be found in Europe are too light for use in that colony. In three instances frames were found to have been fractured, in four the coils broke down, and in two the springs gave way.

Following is the result of the trial on the total points lost out of 1,000 points credited at the start of the contest:—

Name.	Points lost.	Total time.	Non-stop runs. Six possible.
1, Mr. O. Camphin, 12-h.p. Darracq ...	3	h. m. s. 39 58 0	5
2, Mr. T. Rollason, 10-h.p. De Dion ...	36	45 7 0	4
3, Mr. W. R. Grimwade, 14-16 h.p. Tarrant ...	40	37 23 30	4
4, Mr. A. G. Hampton, 6-h.p. De Dion...	45	50 26 0	2
5, Mr. R. Edols, 12-16-h.p. Talbot ...	60	37 36 30	5
6, Mr. F. B. Roche, 8-h.p. De Dion ...	65	47 34 30	3
7, Mr. F. E. Fay, 6-h.p. De Dion ...	141	52 26 30	2
8, Mr. Guy G. Madden, 10-12-h.p. Humber...	321	43 47 40	3
9, Mr. C. B. Kellow, 40-h.p. Napier ...	712	39 14 30	2

Mr. O. Camphin becomes the holder of the Dunlop Cup, the Garland Cup, and a gold medal; Mr. T. Rollason, in addition to the second prize, obtained the Dunlop Plate for the best performance by an amateur driver.

## COMPANY NEWS.

## NEW COMPANIES REGISTERED.

**WARRINER, LIMITED.** Capital, £1,000. To carry on the business of motor-car, motor-omnibus, cycle and flying machine manufacturers. Secretary and registered office, H. Sampson, Riverside Works, Doncaster.

**THE BRITISH MOTOR BODY COMPANY, LIMITED,** of Bannermill, Links Road, Aberdeen, has been registered with a capital of £5,000.

## COMPANY MEETINGS.

**MR. GEORGE SINGER** presided at the annual meeting of Singer and Co. last week, and said, in moving the adoption of the report, that it was better than that presented last year. It would have been even more satisfactory except that the motor department remained in an experimental stage longer than was expected. This stage was now at an end, and cars were now being made for which there was a ready demand. The mistake in making a style of motor-car which was not popular had been overcome, but it was necessary to have more working capital to execute orders for the new style of car. The directors had provided for £20,000 capital under the working agreement with the Singer Motor Company, a subsidiary concern formed three years ago. After some discussion the directors' report was adopted.

**ASTER, LTD.**—At the annual general meeting of Aster, Ltd., held on Monday, it was decided to adopt the directors' recommendation and distribute 15 per cent. on the ordinary shares, after paying the 6 per cent. preference shares, for the year ending September 30th last.

## THE QUALITY OF PETROL.

THE following extracts, supplementary to those already published from the evidence of Dr. Dvorkovitz before the Fuels Committee of the Motor Union will be of general interest. It was impossible to judge of the quality of petrol which is capable of giving the best results by simply taking its specific gravity. The various kinds of petrol at present sold for motor-car purposes are a mixture of a number of hydrocarbons or chemical compounds which consist of carbon and hydrogen. Now the proportion between the carbon and hydrogen in these various hydrocarbons depends to a certain extent upon the sources from which the crude petroleum is obtained, but the ratio of the two varies very little, this being 84.5 per cent. carbon and 15.5 per cent. hydrogen in Pennsylvanian crude oil, and 86 per cent. carbon and 14 per cent. hydrogen in other crudes. Therefore the calorific value of the various benzines obtained from the above crudes must be very close one to another.

The specific gravity does not affect the calorific value. Let us take Pennsylvanian oil. The lowest liquid hydrocarbon obtained from the Pennsylvanian oil is known as Pentane, which has a specific gravity of 0.628 and a boiling point of 100.4 Fahr., while the highest liquid hydrocarbon of the benzine series is called Octane, having a specific gravity

of .703 and a boiling point of 257 Fahr. Here is a very great difference not only in the specific gravities, but in the boiling points, yet their respective values from a calorific point of view are practically the same, Pentane having 83.4 per cent. carbon and 16.6 per cent. hydrogen, whilst Octane possesses 84.2 per cent. carbon and 15.8 per cent. hydrogen. The above figures therefore conclusively prove that the specific gravity of any spirit may be a matter of quite secondary importance in deciding the question as to the suitability or otherwise of various motor spirits.

The chief deciding point for the motorist should be the temperature at which the vaporisation of benzine will take place. Once the motorist knows this, then he can most assuredly depend upon it that his spirit will give complete satisfaction. If motor spirit will evaporate entirely in the air without leaving any trace of oil matters, then such spirit should most certainly be considered as satisfactorily answering all the requirements of the motorist, no matter what its specific gravity is. It stands to reason that if a spirit under ordinary air exposure will entirely evaporate, still more so will it when drawn in by suction or used under air pressure.

## PUBLIC MOTOR SERVICES.

THE Willesden Urban District Council has granted licences for the storage of petrol to bus companies within its area as follows:—The Victoria Omnibus Company, Leinster Road, Carlton Vale, 1,000 gallons; the London Power Omnibus Company, Langton Road, 6,000 gallons;

One of the new 15-h.p. Mors Cars, fitted with a three-quarter landaulet body and cardan shaft transmission. The change-speed gear is controlled by a single lever with gate action, and the drive is direct on the top speed.

and the London General Omnibus Company, Dollis Hill, 1,395 gallons of petrol.

**MESSRS. D. MACBRAYNE, LTD.**, have inaugurated a new motor service between Fort William and Ballachulish.

FOR driving his motor-bus recklessly along Piccadilly a "Union Jack" driver has been fined 20s. and costs.

THE prospectus of the Caterham and District Motor Company, Ltd., which intends to run a motor service for passengers and parcels, has been issued. The capital is £15,000.

**MOTOR-BUSES** are being introduced into Liverpool by the Woolton Motor Omnibus Company.

## THE SKID PREVENTION COMPETITION.

THE following entries have been received for the Side Slip and Skid Prevention Competition:—The Dunlop Rubber Company, Limited; W. H. Newman; Henry Bird; The Hartridge Tyre Syndicate, Ltd.; Liversedge and Son, Ltd.; H. B. Molesworth (two entries); The Reiloe Tyre Co., Ltd.; H. W. Southworth; A. W. Tidbury; The Westminster Industrial and Finance Developments, Ltd.; T. S. Jones; T. A. Cotton and L. Brierley; E. H. Whiting; Arthur J. Maginnis; Edmond Levy; E. W. Hart; Nursey and Marr; E. C. Kingsford; W. H. Lusson; J. Horace Reeves; George Prosser; A. P. Stokes; Walter Sully and P. H. Shailer; William Lowry; W. Waters; Mayfair Motor Company, Ltd.; The

Non-skid Syndicate (two entries); The Parsons Non-skid Company, Ltd., (two entries); Charles Beaven; Morley Agar; Frank Candy; The Compensating Gear Company, Ltd.; L. F. Sachs; George B. Winter; The Wallis Non-skid; P. C. Hedges; Harry Evans; W. Dederich; and Mark Vivian.

### AN ACTION ABROAD.

THERE has just been concluded in Vienna a case of interest to motorists generally, particularly those who purchase cars from makers abroad who have no *locale* in this country. Mr. Gerald Higginbotham, of Macclesfield, was the plaintiff, and Herr Jellinek Mercedes the defendant.

Dr. Kranz, of Vienna (instructed by Messrs. Barclay and Co., of Macclesfield), in opening the case for Mr. Higginbotham said that his client was an English gentleman interested in motor-cars and motor races, and in March, 1905, ordered a racing car from the defendant at the inclusive price of £1,800. Mr. Higginbotham paid £800, being a third of the price, when giving the order, and the balance was to be paid when the car was delivered. The plaintiff contended that the defendant agreed to deliver the car to him immediately after the contest for the Gordon Bennett race at Royat in 1905 had been run, and that it was agreed between him and the defendant that one of the latter's cars should then be delivered to Mr. Higginbotham. It was required for the specific purpose of competing in the English speed trials which were to be held at Brighton and Blackpool in 1905. He attended the Gordon Bennett race at Royat, and immediately after it was over he applied to the defendant's agent to hand him over the car in order that he might take it with him to England, and he thereupon tendered the balance of £1,200. The defendant's agent, however, said that he had not authority to hand the car over, and that in any case the race had disclosed a number of points in which improvements should be made, which they would like to carry out before the car was delivered.

A long correspondence took place between Mr. Higginbotham and the defendant until ultimately the former cancelled the order in writing, and demanded the return of the £800 deposit together with interest from the date of its deposit. The defendant refused to comply with this reasonable request and set up the proposition that he was entitled to deliver the car at any time after the Gordon Bennett race which would suit his own convenience.

Dr. Newmann, on behalf of the defendant, emphasised his own view of the law, and Mr. Higginbotham was then examined and cross-examined at length and under great difficulty, having regard to the necessity for every question and answer being translated both to the witness and to the judges, but after a two days' trial, in which Mr. Higginbotham's evidence was in no way shaken, the judges decided that in the absence of any evidence by the defendant, Herr Mercedes, Mr. Higginbotham had established his claim, but on the urgent application of Dr. Newmann they fixed a further day for taking the evidence of the defendant, Herr Mercedes, on commission at Nice, and promised to re-open the case after this had been done. This evidence was duly taken and a day for further considering the case was then fixed by the court at Vienna.

Before the day arrived Herr Mercedes offered to supply Mr. Higginbotham with an up-to-date racing car for 1907 in fulfilment of his contract, but the plaintiff declined all overtures for a settlement, saying that he was not intending to race in 1907 and that the motor-car would consequently be useless to him, and that he should accept nothing less than the return of the deposit of £800. The day before the date fixed for the further consideration of the case the defendant consented to repay the £800 deposit, and as Mr. Higginbotham had thus succeeded in enforcing the claim to which he had throughout maintained he was both legally and morally entitled, the money was paid and the proceedings terminated.

### A PATENT ACTION.

MR. JUSTICE PARKER in the Chancery Division of the High Courts of Justice has given judgment in the action by Mr. John Gwyer Stroud, of Bristol, against Messrs. Humber, Ltd., of Beeston and Coventry, in which plaintiff alleged that defendants had infringed a patent granted to him in 1905 for an invention relating to improvements in transmission change speed and reversing gear for automobile vehicles. Defendants denied infringement of any valid patent and pleaded anticipation. After a long hearing his Lordship said the only question that he had to decide was as to the validity of plaintiff's patent. The facts were that plaintiff in the summer of 1905 purchased from the defendants a car in which he found the transmission change speed and reversing gear unsatisfactory. Thinking out a locking device he took out a provisional specification. He sent his car back to defendant's works at Beeston and went down and described his device to Mr. Pullinger, asking him to fix it to his car. Mr. Pullinger agreed, and later on wrote to plaintiff:—"The locking arrangement you explained to me I am having worked out to the best of my ability. I am not very good at working out other people's ideas." The car was duly delivered to the plaintiff with his locking device on it, and plaintiff complained that since then defendants had been using his device on other cars made by them. The complete specification was filed in February, 1906, and defendants objected that it was invalid, as plaintiff was not the first and

true inventor, and the invention was not new. Defendants relied on three anticipations: Maybach, Grieg, and James and Hornsby. Having examined all these specifications he found that each of the four characteristics of the plaintiff's locking device was to be found in one or other of the locking devices in the specifications of the prior patents, and all were practically found combined in Grieg's. Having come to the conclusion that these characteristics were not new, considered either separately or in combination, the only question that remained was whether plaintiff had so adapted or simplified known mechanism as to produce what was substantially a new thing. After carefully considering the evidence he had come to the conclusion that plaintiff had not, and that any departure by him from what was known before required no exercise of inventive faculty. The action therefore failed, and must be dismissed with costs.

### CLAIMS AGAINST MOTORISTS.

IN the London Sheriff's Court a jury have awarded £175 damages, with costs, to Henry Webb, L.B. and S.C.R. carriage examiner, of Wandsworth, against Harold Pennell, formerly director of a Wandsworth motor establishment, living at Marine Parade, Brighton. In March the plaintiff was walking along the pavement in St. John's Road, Battersea, when the defendant, in trying to avoid two little girls, ran his motor-car first into a refuge and then on to the pavement, pinning Webb against the wall. He lost twenty-five weeks' work, and on resuming was given employment at £1 a week, instead of £1 8s. The action was undefended.

A MOTOR-CAR turning out from Broad Street, Birmingham, into a side street on August 15th, knocked down and injured a man named Frederick Walter Edge, who at Birmingham Assizes, before Mr. Justice Phillimore, last week, was awarded £120 damages against the Quadrant Cycle Company, Ltd., the owners of the car. It was urged for the defence that the car, which was being tested, skidded owing to the greasy state of the road.

### AN AMERICAN ODE TO THE MOTOR-CAR.

O winged horse! O steed of steel!  
Long centuries thy coming have awaited.  
Into thy vitals hath been poured  
The deep distilment which the Sun-God made  
Ages ago, when, in the morn of Life,  
He kissed the tropic forests with his heated breath,  
And Bloom and Beauty hid themselves in sleep  
Till Time should make them fitted for thy need.

O thou new King of Time and Space!  
In the hot furnace of forgotten fires  
Were forged thy nerves of steel, thy heart of iron,  
Awaiting but the magic touch of man  
To fit thee for thy true and destined place  
In the procession of the triumphs of the ages.  
Go forth upon the Earth in benediction.  
When Sunrise Bell calls toiler forth to new day's work,  
Be thou present to transport him and his burden.

When weary man in city street has spent his vital force,  
Be thou present to carry him to country lane,  
To flower and field and forest green,  
Where tides of life and health set in again,  
To music from the rippling brook and singing birds.  
Again, and yet again, and thrice again, I greet thee,  
O thou last, best gift of all the gods to man.  
On thy countless missions of peace and helpfulness  
Speed onward to Time's latest day,  
O thou Emancipator of the Human Race!

WINTHROP E. SCARRIT.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

[No. 410.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

ONE of the many interesting incidents of the visit of the King and Queen to Chatsworth House last week was the automobile excursion they enjoyed on Saturday when they paid a visit to Lord Burton at Rangemore Hall, Burton-on-Trent—a delightful drive of forty-two miles. Five motor-cars started from Chatsworth at about half-past eleven, with members of the house party, and a sixth car followed with spare tyres and appliances—a sort of repair shop, to put in order any motor-car which might require attention. This relief was not wanted, for all the cars completed the double journey in perfect smoothness. The Queen rode with the Duchess of Devonshire and the Marquis de Soveral in Mrs. Arthur Sassoon's 60-h.p. Napier. The King, accompanied by Mr. Arthur Sassoon, was seated in his Daimler; and in the other cars—his Majesty's Mercedes, and Earl De Grey's and the Countess of Gosford's—were Prince and Princess Henry of Pless and several other members of the party. The condition of the roads was not all that could be desired. A hard frost had been succeeded by an extremely rapid thaw, and the cars, which sped along with an interval of about one hundred yards, caught up a film of limey mud and covered the backs and windows of each. At the entrance to the borough of Derby Lord Burton met his guests, and from this point onward to Rangemore his lordship piloted the motor procession to the Hall. By way of Monk's Bridge they journeyed to Rangemore, which was reached at 1.15 p.m. The return journey was commenced about half-past three. Chatsworth House was reached at five o'clock.

### Mails by Motor.

THE postal headquarters at Norwich introduced motor mail vans on New Year's day between the city and some of the principal towns in the county. The cars, which are all coloured in postal red, are fitted with 14-h.p. engines, and can carry a ton at a speed of ten miles per hour. They will convey mails from Norwich to Wymondham, Dereham, and Fakenham; from these centres there will be connecting services, and the motor mail vans will also perform the journey in the reverse direction. The result will be to give the public much later postings to the country, in some cases the time being postponed by two and a half hours, while in the country the mails will arrive earlier than is possible with horsed mail carts, and the hours of posting will also be extended.

### An American Invasion.

SOMETHING like an organised invasion of the Old World by the New has been thought out by the fertile mind of Citizen George Dupuy, a member of the New York Motor Club. The idea is to hold a road competition over about 4,000 miles of France, Spain, Austria, Germany, Belgium and England, for the American Gold Cup given by a group of millionaire motorists. The scheme as planned is to take place in June and July of the present year, and three hundred people are to be allowed to take part in the great motor cavalcade, which will comprise fifty or sixty cars of a dozen of

the leading vehicles of American make. It will be a demonstration of the American touring car, forming a combination of pleasure and publicity, that the originators of the plan hope will appeal to the minds of the motor-car manufacturers of the United States. The itinerary as provisionally sketched is to go from New York to Havre by steamer, and then by road to Paris and over the Pyrenees into Spain to see bull fights. Then back into France a trip will be made to Nice and Monte Carlo *en route* for Italy and the other countries of the Continent already mentioned. That portion of the trip will conclude at Calais, whence steamer will be taken to Dover and road to Liverpool *via* London, Coventry, and Birmingham. Such an excursion should prove a very delightful and somewhat dusty undertaking.

### Motor Ambulances in Crowded Areas.

EVIDENTLY the view that we have always taken as to the decided advantages that would result from the adoption of the motor ambulance in the suburban areas of great towns is recommending itself to the authorities in crowded areas. Already we have recorded the acquisition of a motor ambulance by the City of London authorities, and the provision made for its telephonic association with the rest of London. But, according to Dr. Waldo, the coroner for Southwark, such appliances should be provided all over London. During the course of an inquest held at Southwark it was stated that it took considerably over half an hour to get the deceased man to Guy's Hospital on an ambulance, and Dr. Read said it would undoubtedly be a great boon to have a motor ambulance in Southwark, as such a large number of accidents occur in that district. It would ensure prompt treatment, which would be an immense advantage. The adequate equipment of all great towns in this respect is only a matter of time.

### Tar v. Dust.

MATTERS are developing rapidly with regard to the competition for a tar-spreading machine which is to be conducted by the Roads Improvement Association, the A.C.G.B.I., and the Motor Union, acting jointly in the management of the trials. After due consideration, the three bodies mentioned have agreed that tarring has, so far, proved itself to be the best palliative for laying dust. Unfortunately, the present systems of applying the remedy are expensive, involving the use of an excessive quantity of material, and being attended by minor disadvantages. Hitherto the general practice has been to remove the loose dust from the surface of the road, apply hot tar, and brush it into the interstices of the road surface by manual labour. The road is then covered with sand to prevent the tar picking up on the tyres of passing vehicles. A second coating is required after an interval of six weeks, but in subsequent years only one coating is usually necessary. This system has been applied to many miles of main roads in Kent, Surrey, Middlesex, and Hampshire, and on a smaller scale in other districts. The cost of thus treating a road of an average width of eight yards with two coats of refined tar is between £60 and £90 per mile, or about £60 per mile if a period of three years is taken. The cost of materials and labour must be lessened considerably if there is to be a wider applica-

tion of tar to roads. If a mechanical apparatus can be constructed, either in the form of a horse-drawn cart or mechanically-propelled vehicle, that would spray the tar upon the road, the labour factor can be reduced very considerably. Such an apparatus should apply the tar more uniformly and cause it to penetrate to a greater depth, and as the quantity of tar required would also be much less, the economy would be undoubted. Hence the value of the forthcoming competition, which will be carried out as far as possible upon ordinary roads of varying characteristics. Vehicles may be either horse-drawn or mechanically-propelled, but, other things being equal, preference will be given to mechanically-propelled vehicles. Entries will be received by Mr. Rees Jeffreys up to March 31st, and among the judges who have been appointed are the county surveyors of Kent, Middlesex, and Hampshire, and the city engineers of Liverpool and Birmingham.

### Horse v. Automobile.

THE automobile is the best friend of the horse, relieving him from many burdens that have hitherto been regarded as the lot of the equine. In the early days it was fashionable to decry the motor-car as the foe of the horse; now public opinion has veered round, and the President of the Illinois States Veterinary Medical Association, at a convention of horse doctors at Chicago, has been giving statistics from the bureau of

The above illustration is reproduced from a photo sent us by the Adams Star Cycle Co., of Wellington, New Zealand. It depicts a 16-h.p. Minerva, driven by Mr. Donald Kemsley, in difficulties at Hastings, Hawkes Bay, N.Z., during the course of a heavy flood.

animal industry, which showed that since the operation of the automobile became so general throughout the States horses have regained strength, a better breed is being realised, and that its worth has advanced more than 100 per cent. in the last five years. This should be satisfactory news to those who love the horse, and who are glad to know of the increased regard with which he is now treated; as opposed to the old-time notion that the horse was mainly "a beast of burden."

### The Horse at his Zenith.

In connection with this matter the returns lately issued by the Board of Agriculture may be referred to as affording documentary evidence as to the state of things in Great Britain. The figures for 1906 show that the number of horses is less by 3,752 than it was in 1905, when the total reached the highest figure yet recorded. The reduction is mainly in agricultural horses and in the unbroken horses of under one year. This latter category is useful to our purpose in indicating the condition of horse breeding in this country. During the seven years preceding 1906 there was a steady increase in the number of unbroken horses under one year of age, and the horse-breeding industry was holding its own despite the advance of the automobile. But now this has been stayed

and the officials of the Agricultural Department call the attention of horse breeders to the position, saying that "if the reduction of young stock in 1906 is to be regarded as significant, it may perhaps indicate that a limit has been reached, and that the development of mechanical means of road locomotion is beginning to check the breeding of horses in Great Britain."

### The Brooklands Track.

THERE will be no lack of racers on the Brooklands racing track, and already Messrs. S. F. Edge, C. Jarrott and J. E. Hutton have shown willingness to return to the racing arena, while Mr. Colin Defries has issued a challenge with his Porthos car, acceptance of which by Mr. Edge would add to the delight of the motor world. Anyway it is evident that there will be no lack of sport, and when matters crystallise somewhat we may be able to draw up an interesting programme. At present, however, the contests appear to be hedged about with so many conditions that some of the parties are disinclined to accept. Why not let each challenger have his day on the track and do his best; and then let as many as can race side by side in the spirit of the old charioteers striving all they know to gain the mastery? That, at least, would give the British public something new to talk about.

### Exemptions from Revenue Duty.

OUR readers have doubtless been supplied with the yellow paper with which the Inland Revenue authorities make known the exactions they require at this season of the year from those who own motors, carriages, &c. The amounts of the licences are clearly set forth and generally known, but, in view of the more general adoption of the motor vehicle for purposes of trade, the exemptions may usefully be set forth. Licences, we would therefore remind our friends, are not required for a motor, or vehicle drawn by a motor, which is constructed and adapted for use and is used solely for the conveyance of any goods or burden in the course of trade or husbandry, and whereon the christian name and surname and place of abode or place of business of the person or the name or style and principal or only place of business of the company or firm keeping the same shall be visibly and legibly painted in letters of not less than one inch in length; or for any carriage or motor used without payment for the conveyance of electors to or from the poll at any Municipal, County Council, or Parliamentary election, and not otherwise used during the year; or for carriages or motors kept but not used at any time within the year. This latter clause will answer some of our correspondents who have written us on the subject.

### Motorists and Cyclists.

THE embittered discussion that a short time since raged in the pages of some of our contemporaries has led the Cyclists' Touring Club to publish, for the benefit of its members, a summary of the provisions of the chief Statutes that have a bearing upon the behaviour of motor-car drivers. In commending this to the club, Mr. E. R. Shipton says if the member be a motorist, and a considerate one, he will gladly read, mark, learn and inwardly digest the code of offences of which he is never likely to be guilty; if he be an anti-motorist he will note with delight that when he witnesses a wilful infringement of the rights of other sections of the road using community, he has many remedies lying ready to his hand should he decide to put the law in motion. In this connection it is interesting to note that one of the members of the Rights and Privileges Committee of the C.T.C., who is both a motorist and a cyclist, recently succeeded in obtaining a conviction against a motor-car driver who raised a blinding dust, and totally obscured the view of himself and other road-users, on the Portsmouth road between Esher and Cobham in September last. He took the number of the car, and reported the facts at the nearest police station, with

the result that a summons was issued for "driving to the common danger." He also attended at the hearing of the summons and gave evidence, when the driver was fined and had his licence endorsed. This is probably counted "for merit" in the official ranks of the C.T.C.

#### Motoring on a Railway Track.

MR. GLIDDEN'S Napier has piled up a mileage of 36,657 miles in thirty-six countries without once having broken down. The latest adventure of this inveterate globe trotter was to drive his vehicle 6,714 miles on the track of the railroad companies from Chicago to the City of Mexico. Five minutes' delay would have disarranged the entire work of the trains. Freight and passenger trains were met on side tracks about every ten miles, and it was the motorists' good fortune not to delay for one moment the immense traffic moving on the American and Mexican railroads, all but 220 miles being single track. Where the traffic was exceedingly heavy they ran as an extra with special rights and given some very close meeting points. Not having a loud whistle, slow downs and stops were necessary to allow section men to remove their small cars or

lost twenty-five minutes; but, as the mileage increased and the ground continued to rise, so the snow continued to accumulate. By the time the Cray Waterworks were reached the car had to be lifted over two large snowdrifts at least four feet high in some parts. When Brecon was left behind a blinding snow-storm was met, with a strong wind driving the snow under the hood to the passengers in the back seats, and compelling Mr. Sutton to drive, or rather crawl, on low speed with the clutch pedal in use every other second. The road in some places was four feet deep in snow, and so well was it covered that it was impossible to prevent driving over ditches and common in turns. With darkness coming on, it was necessary for the two male passengers to get out and push the car through the mountains of soft snow. The trip across the Beacons by motor will be a lasting memory with all the occupants—more especially the ladies, who, knowing that the Common is over ten miles long, without a house anywhere near, and how impossible it would be to walk to the nearest hostel, were quite resigned to their fate to spend the night in the car—which would certainly have been the only thing open to them had the machinery broken down or a less competent driver been at the wheel. After several hours' struggle, however, civilisation was

A Popular Winter Pastime at Caux, Switzerland.

jacks from the rails, and caution was required on some sharp curves to relieve the strain on the wheels, which, with the exception of the steel rimmed tyres, were ordinary automobile wooden spoke wheels. The only parts of the car relieved from the usual wear and tear were the springs and frame, but the engine and transmission was obliged to maintain throughout the journey a lively pace.

#### On the Brecon Beacons in a Snowstorm.

FOUR days after the heavy fall of snow at Christmas, when the streets of the towns were beginning to get "slushy," the ordinary mortal might be forgiven for thinking that the country at least would be passable, but the experience of Mr. Ernest Sutton, of Messrs. Sutton Brothers, the motor agents, of Swansea, demonstrated that the roads at 1,200 to 1,500 feet above the sea level cannot be depended upon. His 10-12-h.p. Humber car, with himself, Councillor W. Tarr, Councillor H. G. Solomon, and two ladies on board, started off and travelled the first eight miles gaily. A puncture in the front tyre caused the first stop, another at the end of thirteen miles

reached, a light in a chapel was seen ahead, and never was a little country chapel more appreciated from the outside than on this occasion. Hirwain and Glyn Neath were soon reached in the slush, and Host Jones, of the Angel Hotel, Pont Neath Vaughan, with the aid of a huge fire and some home-cured ham and fresh eggs, soon revived the half-dead travellers, and the journey was continued; before Swansea was reached again, just before midnight, an inlet and an exhaust valve smashed and the radiator was bulged in, but "home" had been reached without loss of life, and everyone was indeed thankful to turn into bed to remain for a few days to shake off the effects of Motoring under climatic difficulties.

#### Motoring in the Parks.

IN consequence of many complaints on the part of the residents in and around the Regent's Park, London, of the annoyance and inconvenience caused by the reckless driving of motor-cars through the Park after nightfall, instructions were given to the gate-keepers by the Crown Estates Paving Commissioners to prevent, as far as possible, the entry of motor-

cars at night, unless they were proceeding to houses near the Park. These instructions have now been withdrawn; but the nuisances complained of are said to be real and serious, and, unless they are abated, it may become necessary to frame a permanent regulation for the exclusion of cars at certain times. The matter having been brought to the notice of the Motor Union, that body has assured the First Commissioner of His Majesty's Works that he will have the co-operation of motorists generally in putting a stop to the nuisance of which complaint is made, and we would urge our readers to co-operate with the authorities in putting a stop to any reckless driving in the Regent and other parks in and about London.

#### Motor Volunteers in Ireland.

THE remarks of Lord Grenfell in declaring the Motor Show open in Dublin will be appreciated by all who are interested in the encouragement of the automobile section of the Army. As Sir William Goff subsequently observed, his Lordship, probably more than most men in Ireland, is closely identified with the motor movement, for, largely owing to his exertions, the Motor Service Corps, which had taken the place of the old Volunteer Corps, had been put on a firm basis and a branch had been extended to Ireland. Of this a great many members of the Irish Automobile Club are officers, and its success is as assured as its utility is acknowledged. Lord Grenfell in his speech said he, as commanding the Forces in Ireland, had been assisted greatly in his military inspections by the Motor Volunteer Corps. He gave to Sir William Goff, Colonel Chaloner Knox, and the members of the corps the sincere thanks of himself and the members of his staff for the enormous use they had been to them in their work in Ireland. They had always found that no weather and no distance would deter them, and he was glad to have the opportunity that day of rendering his thanks.

#### Motorists to be Taxed for the Roads.

It would appear that common sense is penetrating into the bucolic mind as expressed at the deliberations of rural councils, and that reason may ultimately prevail. The Filey Urban District Council have passed a resolution in favour of the revenue derived from the proposed taxation of motor-cars being devoted to the improvement of public roads. Not only this, but the Council is urging Yorkshire M.P.'s to support its view whenever proper opportunity offers. Mr. Gervase Beckett, M.P. for the Whitby Division, and Mr. Luke White, M.P. for the Buckrose constituency, have both expressed themselves in accord with the views of the Filey people, who are but echoing the sentiments of motorists in the matter. If we are to be taxed, it is to be hoped that some such wise disposition of the revenue thus obtained will be made.

#### Points against the Motor Car.

A SOMEWHAT novel policy is being adopted by the Automobile Club of America in setting forth the main objections that can be urged against motorists in cities, and asking all who drive to direct their attention to avoiding such unpopular features as far as possible. At the meeting of the Board of Governors of the club, Mr. Winthrop E. Scarritt, a former president, presented a long report dealing with these subjects, from the standpoint of their disastrous effects upon motorists, as well as upon the public, and with reference to several possible methods of obviating them. He spoke of the smoke nuisance, the needless tooting of the horn, or the blowing of the siren whistle; the dust nuisance, and the habit of keeping the flaring acetylene headlight burning when such lights are not only unnecessary to the automobile in the city streets, but are an actual annoyance and possible source of danger to pedestrians and horsedrawn vehicles. Here probably are the main points of opposition that can be raised against the motor car. It will be seen that motorists themselves are doing all they can to lessen the occurrence of these disadvantages.

#### Chauffeurs' Illicit Commissions.

IN our correspondence columns Mr. S. F. Edge refers to the view of his solicitor with regard to the Prevention of Corruption Act, 1906, in stopping the requests of chauffeurs for illicit commissions on goods obtained by them for their employers. This view entirely coincides with what we have previously written in these columns, and we trust that the publicity that has been given will have its effect in arresting what has become not only an irritating nuisance, but almost amounts to blackmail in some directions. Now that chauffeurs know the illegality of requests for commission and presents for themselves when they do business on other people's behalf there should be a speedy end to the evil, or trouble may ensue.

#### A Profitable Business.

ALTHOUGH there has been a lull in the activity of the police against motorists in many districts, the business of trapping owners of motor-cars is still a profitable one in many counties. At a meeting of the Huntingdonshire Standing Joint Committee, on Monday, the Chief Constable reported that during the past year 172 motorists had been proceeded against in the county. Four of the cases were dismissed, but fines were inflicted in 168 cases, the total fines, including costs, amounting to £1,276 7s. 7d. None of the proceedings were taken under the speed limit section, all the defendants being summoned for driving to the common danger. Ten offenders escaped, either by giving false names and addresses or by driving so fast that their numbers could not be deciphered.

A NEW edition of the M.C.J. Identification Card, which now gives the road signals for motorists, as well as the letters of identification in use throughout the United Kingdom, has just been published.

MR. R. J. MECREDY, writing to the Dublin press, expresses the view that a series of shows in Ireland "will help to bring us nearer to the day when a large proportion of Irishmen will purchase Irish-built cars."

THE London and North-Western Railway Company have made special arrangements for the careful handling of motor-cars to and from the steamers at Holyhead and North Wall during the Irish Motor Show.

WE hear that a Chelsea firm are about to introduce a new fuel for petrol cars; it is stated to consist of 75 per cent. of common paraffin and 25 per cent. of a new hydrocarbon. The combination is claimed to be equal to petroleum spirit, while costing considerably less.

WE note that in America several manufacturers are using Messrs. Reddaway and Co.'s camel-hair belting for the lining of brake bands—a use which the firm might well advocate in this country, where the merits of their speciality have long been demonstrated in other directions.

THE Simms Motor Manufacturing Company, Ltd., have taken the premises lately occupied by Messrs. Panhard and Levassor in Kimberley Road, Willesden, for the extension of their Welbeck works. It will be remembered that we lately announced the removal of the Panhard repair works to Acton.

To celebrate the occasion of the centenary of the establishment of the firm of E. H. Bentall and Co., and also the coming of age of Mr. C. E. Bentall, eldest son of Mr. E. E. Bentall, J.P., the head of the firm, a dinner and entertainment was given at Maldon last week. An excellent repast was served in the fitting shop of the Heybridge Works. Over 700 employees and their wives were present.

MR. W. H. STONE, of the Taunton Hiring Garage, Staple-grove Road, Taunton, sends his hiring tariff for 1907, which is well illustrated with pictures of the various departments of the works. He makes a special feature of providing cars for excursions, race meetings, &c., and among the points of interest in the list we notice that "a chaperone can be provided for ladies at half-a-guinea daily."

## THE HISTORY OF THE ROAD.

THE late Sir Francis Jeune, whose regular attendance at the early Motor Car Exhibitions at the Agricultural Hall revealed his keen interest in the new locomotion on common roads, was one of the first to emphasise the enlarged circle of social activities made possible by the coming of the car. By its adoption the country gentleman became independent of the railway, with its dreary waits and stations far distant from mansions and country estates. He was able to pay the round of visits in double quick time, lengthen his stays where fancy dictated, and generally find more enjoyment in life. The enthusiasm of Sir Francis cared not for the rough roads and undisciplined hedges of the countryside; he only felt the exultant spirit that developed with speed. And so in those early speeches which advanced the industry many stages in Society estimation he said nothing of the roads, which constitute so great a factor in automobile enjoyment.

The Romans were the most famous road makers, and their Appian Way, begun in 312 B.C., is still in use. Mr. P. C. Cowan, the Chief Engineering Inspector of the Local Government Board for Ireland, who has made a special study of the history of road making, says that the Roman roads "were composed of four layers, except when a natural foundation of rock was found. The lower layer was formed by courses of large flat stones, or, when these were not obtainable, with stones laid in mortar; the second layer was of rubble masonry, of smaller stones, or a coarse concrete; the third, a layer of fine concrete; and the finishing coat, a pavement of polygonal blocks of hard stone, jointed with the greatest exactness—the total thickness of the four layers being in some cases three feet. With a rock foundation, only the third and fourth coats were used."

France, in common with many other countries, followed this system during succeeding centuries; but the later inhabitants of Britain did not learn the lesson. Their roads frequently followed the course of a river, and, save where they continued to

Motor Wagons for Military Purposes.—Oiling up the vehicles used in the Austrian Army at Brunn.

(Allgemeine Automobil Zeitung.)

But since then the motor-car has multiplied, and the roads have shown signs of disintegration into dust. There are those who assail the modern vehicle because of the glaring lights that it shows at night and the cloud of dust that it raises by day. The onrush of the motor-car has brought into prominence the question of roads—construction, improvement, maintenance, and all the other incidental aspects of the great problem of travelling without metal tracks. This revival would astonish some of our forefathers—the men who saw the coming of the railroad and deplored the passing of the horse, who witnessed the turning from the highways, and the general triumph of the Iron King over all other means of transit in the early Victorian days.

But the whirligig of time is bringing back the prosperity of the roads, and motorists have become almost as much interested in this subject as were the Romans when they disturbed British forests to make easy the passage of their soldiery over other people's territory.

make use of the highways left by the Romans, little systematic regulation of roads took place for many centuries in our island's story.

Not much care seems to have been given to the repair of the highways. When one became worn another track was cleared alongside of it by the inhabitants of the districts who were responsible for that part of the highway within their area. The first tolls in connection with the roads were levied in 1346, but repairs were generally effected under the Statute Labour Acts, which compelled the people to give their own labours in the actual work—a policy destructive of anything like systematic organisation. In 1555 a law was enacted that inasmuch as the highways had become "very noisome and tedious to travel in and dangerous to all passengers and carriages," surveyors were to be elected to take charge of the work, calling upon the parishioners to do the labour of road repairs on four days during the year. Queen Elizabeth, who was frequently engaged on visits

by road to her nobility, must have often experienced irritating delays owing to the bad state of the highways, and probably her skrewd common sense may have had something to do with the Act passed in 1562 empowering the supervisors to compulsorily take loose stones from the neighbouring quarries to repair any roads that required such material. Trees and hedges were also cut down for a great width on each side of the road, so that the safety of users of the road should be assured from robbers who might lurk therein.

Things were left pretty much the same for a hundred years or more, when traffic was still increasing in volume throughout the country. In 1662 the hackney coaches in London had become such a nuisance that special legislation was required to deal with them. It was enacted as a general law that no vehicle was to be drawn by more than seven horses or eight oxen, and that tyres were not to be less than four inches wide. In the seventeenth century turnpikes became a feature of the road, and in the reign of George III. Turnpike Trusts were created, which first gave some sort of encouragement to good roads.

As late as the middle of the eighteenth century the roads communicating between Kensington and the City of London

The 24-h.p. De Dietrich, supplied to Sir Robert Harvey by Messrs. Jarrott and Letts. There are a number of interesting features comprised in the special limousine body with which the vehicle is fitted, among which may be mentioned the bay windows at the sides, which permit of a wider range of view to the occupants of the rear seats.

were so bad that Lord Hervey complained of the solitude in which he lived in the western suburb, there being "an impassable gulf of mud" between them and the citizens. The metropolis was less well served in this respect than the Highlands, roads for military purposes having been made by General Wade. These were a great convenience to the people, and remain so unto this day, as those who have endured the strain and stress of Scottish Reliability Motor Trials can testify. Arthur Young's travels in the later years of the eighteenth century revealed little improvement, however, so far as the greater part of the country was concerned.

Then came Telford and Macadam. The former in his system provided a firm foundation. He dug out the road and made a "bed" of rough close set pavement with six inches of broken stone which was rammed hard; over this was laid the upper crust of macadam. On these new roads, as Sir Walter Gilbey points out, "coachmakers and contractors were able to put into practical operation the improvements in vehicles which had been waiting an opportunity for development. The general

adoption of this system brought about the "golden age" of fast coaching with remarkable rapidity.

Telford and Macadam in the early years of the last century made road-making a scientific study, and much would probably have been done. But the coming of the railroad altered the direction of men's thoughts, and Dr. Samuel Smiles tells how some of Telford's plans for main roads throughout the country were abandoned "on account of a report in 1829 regarding a locomotive competition at Rainhill directing attention to the new method of travelling." Still some progress has been made in these early years. Steam rolling in the repair of roads only dates from 1864, when it was introduced into Paris, its advent to this country being even later. It is less than twenty years since the county surveyor of co. Down was the first to attempt steam road rolling in Ireland, which is still very backward in that respect.

Seeing that so many generations in the past have done little or nothing to improve the roads of the country, it is not surprising that many of the main arteries, and a larger number of the secondary ones, are unable to bear the stress and strain of the new motor-car traffic. It is unquestioned that the roads in many parts of the country cannot long withstand the disintegrating tendency of heavy traffic; they have no "bed," and require reconstruction rather than repair. The development of heavy motor vehicles will require many secondary routes to be raised to the strength of the main arteries, and Mr. W. B. Hulton, the chairman of the Main Roads and Bridges Committee of the Lancashire County Council, has declared that in twelve months £8,000 was spent in repairing damage done by this traffic on the roads between Blackburn and Preston. More than that is the dust question associated with motoring. The car has disturbed the dust on the surface, and various efforts have been made to alleviate this irritating feature of travel. At the time of the Gordon Bennett race in Ireland, Westrumite was laid with good effect in preventing the rising of the dust; during the Brighton race meeting of 1905 Tarmac gave a track along which cars travelled swiftly without the clouds of dust marking their progress. Akonia, Crempoid, Hahnite, Taafalt, and other compounds have also been employed to mitigate the nuisance. They have proved palliatives of undoubted value; but it is unquestionably the fact that the authorities throughout the country are looking more to improved construction and the devising of a "waterproof" road that should prevent the access of water below the surface, with the consequent disintegration that follows frost, rather than to continued coatings with tar and other materials. Meanwhile, the experiments of the Automobile Mutual Protection Association, in conjunction with some of the county surveyors, lead to the hope that the second decade of the modern automobile will be assisted with roads better adapted to its development.

Although the multiplicity of authorities controlling main roads prevents absolute uniformity, great improvement is going forward. On the Great North Road there are seventy-two authorities responsible for the maintenance of various portions of its length. Up to comparatively recent years there were twenty-eight highway authorities in Gloucestershire repairing roads, and the same confusion prevailed elsewhere. The Council of the county named has, however, taken all the main roads not claimed by urban authorities under control, and 1,043 miles of roads are now managed by the Gloucestershire county surveyor. Elsewhere this system of centralisation with the county area as the unit has been followed—a step in the evolution towards that national control which will be urged in the forthcoming Session of Parliament by the Hon. Arthur Stanley and his friends. This is the goal at which motorists, in common with all who have given the matter attention, are aiming, viz., the transferring of road management from countless authorities to a central organisation which shall proceed with due regard to the coming means of locomotion, viz., the motor-car that will require a good road whereon to travel, rather than the tram-car, whose metal track seems intended to keep in obscurity the want of system which has characterised our roadways in the past.

## INDUSTRIAL VEHICLES AT THE PARIS EXHIBITION.

**A**LTHOUGH as regards numbers there was a large increase in the number of exhibitors of industrial vehicles, the display in the annexe of the recent Paris Salon did not bring to light any startling feature or radical departure from what, for the moment, may be termed standard practice. Considerable interest was evinced in the new Darracq-Serpollet 30-40-h.p. steam bus. The arrangement adopted follows, generally speaking, those employed in the Serpollet steam cars, the flash generator being located under the bonnet in front, and supplying steam to a horizontal engine, comprising two high-pressure double-acting cylinders. The differential gear, which is driven by spur pinions off the engine-shaft, is enclosed in the crank chamber, the power being thence transmitted direct to the rear wheels by side chains. The burner is, it is stated, designed to use any form of liquid fuel. A 20-25-h.p. chassis on similar lines, but intended for motor lorry and delivery vans, is also being built.

A new addition to the list of petrol motor-'bus and lorry builders in France is Messrs. AMBLARD AND CO., of Dieppe.

the transmission by a cardan shaft and bevel gear to a cross shaft just forward of the central axle, the road wheels on which are driven by means of spur gearing.

The FIAT COMPANY exhibited a new type of 40-h.p. 'bus chassis, in which the engine is not under the driver's seat as formerly, but located under a bonnet in the usual way. Throughout the vehicle is solidly built, and among the improvements which may be mentioned are the adoption of a system of pressure-fed lubrication of the engine. The brake pedal and the hand lever each control two brakes, the latter, the usual pair acting in drums on the rear road wheels, while water-cooled drums are provided both on the differential shaft and on the forward end of the gear-box side shaft. The road wheels are of the disc type, being built up of two concave steel discs. An ambulance van (Fig. 1), built for the Italian Red Cross Society, was also shown by the Fiat Company. Another company which has also re-designed its motor-'bus chassis by placing the engine under a bonnet, instead of below the driver's seat, is the GERMAIN, who exhibited a vehicle fitted with a 24-h.p. engine, in which the ignition is automatically advanced and retarded. The clutch, as in the Fiat 'bus, is of the multiple disc type, and the final drive is by side chains. A feature of

The Lacoste and Battmann Lorry used by the Gaulois Tyre Company for the delivery of tyres in the Paris district.

The vehicle is designed on very substantial lines, the frame being of great strength. The motive power is supplied by a four-cylinder engine, which drives through a leather-faced cone-clutch, gate-controlled gear-box and silent chains to the rear wheels. It may here be mentioned that this type of chain would appear to be superseding the roller variety for 'bus work, for we noticed it was adopted on several of the vehicles on view. The SOCIETE DES AUTOMOBILES BRILLIE had a distinct novelty in the shape of a six-wheel motor-'bus chassis, of which an illustration has already appeared in these pages. The central pair, which form the driving-wheels and are of larger diameter than the others, is situated at about the same distance behind the front wheels as on an ordinary four-wheel chassis, the frame being extended to the rear to accommodate the extra pair of wheels. The latter, like the front pair, are connected with the steering mechanism, so that the four wheels move simultaneously to turn the vehicle. Although the chassis has a wheel base of about 17 ft. it is claimed to be capable, on account of the four wheel steering, of turning in the same circle as an ordinary four-wheel 'bus. The vehicle is fitted with a new motor of 32-40-h.p., the feature of which is the accessibility of the working parts. The clutch is of the multiple disc type and

the change-speed gear is that the single controlling lever is inter-connected with the clutch pedal in such a way that the gear cannot be changed unless the clutch is withdrawn. The gear-box, it may also be mentioned, is provided with its own oil circulating pump, it being driven by worm gearing off one of the shafts.

Several improvements are to be noted in the latest models of the German Daimler motor-'bus and lorry chassis, which, while known in this country as the Milnes-Daimler, are being imported into France by a concern bearing the title of the SOCIETE DES AUTOMOBILES COMMERCIALES. One of the principal changes is seen in the adoption of pressed steel distance rods in place of the armoured wood type hitherto employed. Messrs. DELAHAYE AND CO. had on view a double-deck 'bus with final drive by silent chains, built for the London and District Motor-'Bus Company. At this stand were also shown a single-deck 'bus, a motor-hearse, and a motor fire-engine, the latter being intended for the Paris Fire Brigade. The ARIES COMPANY are now devoting attention to motor-buses, and had on view a 24-30-h.p. chain-driven double-decker for the Compania de Automoviles Lima, for service in Peru, and a single-deck vehicle built for the Egyptian Motor Traction Company. Messrs.

BOYER AND Co. exhibited a 40-h.p. four-cylinder 'bus chassis, in which side-chain transmission is employed. A noticeable feature is the employment of shock-absorbers, which consist of plungers working in semi-spherical rubber blocks connected with the spring hangers.

A noteworthy feature of the 'bus chassis of the TURGAN COMPANY is the frame, which is of unusual strength at the point where it is narrowed to increase the steering lock. The KRIEGER COMPANY exhibited a novelty in the shape of a combination petrol-electric double-deck 'bus built for the Allgemeine Berliner Omnibus Gesellschaft, of Berlin. In addition to a 12-15-h.p. van the CLEMENT-BAYARD COMPANY had on view a 24-30-h.p. chain-driven char-a-banc, while Messrs. DE DIETRICH AND Co. exhibited a motor fire-engine and a 16-h.p. twenty-seated motor char-a-banc, the latter being built for the Cairo Automobile and Omnibus Company. The body is separated into three compartments, the forward two being for second-class passengers, and that in the rear for those travelling first class. Other exhibitors of motor-'bus chassis included Messrs. S. STRAKER AND SQUIRE, LTD., Messrs. DE DION, BOUTON AND Co., Messrs. BERLIET, of Lyons (in whose vehicle the engine is under the driver's seat), the ORION COMPANY, Messrs. DUCOMMAN, of Mulhouse, Alsace, Messrs. LACOSTE AND BATTMANN, the PEUGEOT COMPANY, M. A. SAURER, and the USINES DE PUTEAUX. Small motor-'buses for station work were also shown by the SOCIETE DES AUTOMOBILES DE LA BUIRE, of Lyons; Messrs. DELAUGERE, CLAYETTE AND Co., of Orleans, and Messrs. PANHARD AND LEVASSOR. Although not exactly in the exhibition, the WESTINGHOUSE COMPANY had running outside the first of their double deck motor-'buses, the final drive of which is by Morse silent chain.

Passing from motor-'buses to industrial vehicles, steam wagons were only shown by two firms—M. CHABOCHE, of Paris, and M. V. PURREY, of Bordeaux. The latter is the leading constructor of steam lorries in France, a large number of the same being already in use. On the platform of the wagon exhibited were mounted two trucks sliding on rails and provided with flap doors at the sides to facilitate loading and unloading. The road wheels are of the solid wood disc type with steel tyres. M. Chaboche has given up the construction of touring vehicles in favour of steam lorries and exhibited one of six-ton capacity in

Fig. 1.—The Flat Motor-Ambulance built for the Italian Red-Cross Society.

which the coal-fired boiler is fixed in the fore part of the chassis. The engine is of the horizontal two-cylinder type, the final drive being by side chains.

Petrol lorries and vans were shown by a large number of concerns, including the ORION COMPANY, Messrs. DE DION, BOUTON AND Co., the ARIES COMPANY, the ATALIER DE CONSTRUCTION MECANIQUE, of Arras (Pas de Calais)—a new concern, of which M. Turgan is the head, this gentleman having left his old company—the BERLIET Co., Messrs. D'ESPINE, ACHARD AND Co., Paris, M. C. TANTZ, of Pont-a-Mousson, in whose 3-ton lorry a

belt is employed to connect the two-cylinder horizontal engine with the gear-box, the PEUGEOT COMPANY, the MORS COMPANY, Messrs. PANHARD AND LEVASSOR, and Messrs. MATHIAN FRERES. The vehicles shown by the latter concern are made by Messrs. A. Cohendet and Co., and are known as the Bretin. The engine is of novel design, the water jackets, which also extend round the valve chamber, being barrel-shaped and of unusually large capacity. The motor is set low in the frame and is located below the driver's floor-board.

Fig. 2.—Elevation and Plan of Emress Lorry.

LA SOCIETE FRANCAISE DES CAMIONS HAGEN, of Paris, has apparently given up the special system of lever and ratchet drive employed in the Hagen vehicles, for they exhibited a new 5-ton wagon, which they have named the Emress, in which the usual system of transmission through a sliding pinion type of change-speed gear is employed. They claim, however, to have produced a gear-box which will withstand the rough work industrial vehicles are called upon to perform. We give an elevation of plan of the vehicle in Fig. 2, from which the special design of frame will be seen. The side members are quite straight, and from the rear to a point just forward of the gear-box are in duplicate, the arrangement obviating any curving of the channel steel employed to increase the steering lock, and also giving a maximum of platform area to the lorry. The four-cylinder engine is of 24-h.p., and the clutch is of the metal-to-metal type. The final drive is by side chains of a silent pattern known as the Varietur.

The Avant-Train Latil was again shown by LA COMPAGNIE FRANCAISE DE MECANIQUE ET D'AUTOMOBILES, of Levallois-Perret. This consists of a motor fore carriage which can replace the front wheels of any horse-drawn vehicle, and so convert the latter into an automobile. The engine is located under the bonnet, and is connected with a change-speed gear of the usual type, which, in turn, drives spur gearing attached to the front road wheels through transverse cardan shafts. A number of vans and lorries on this system, designed to carry from 2 to 3 tons, were on view, including one for the VACUUM OIL COMPANY. M. JANVIER exhibited his six-wheel lorry, which has already been illustrated and described in the *M.C.J.* The BROUHOT COMPANY, of Vierzon (Cher), displayed a petrol lorry for the Grand Refinaria do Rio de Janeiro, Brazil. The engine is placed under the driver's seat, and transmits the power through a cardan shaft to the gear-box, which is formed in one with the differential casing, the final drive being by side chains. The exhibitors of light delivery vans included Messrs. LACOSTE AND BATTMANN, the GILLET FOREST COMPANY, the CLEMENT-BAYARD COMPANY, Messrs. RENAULT FRERES, and Messrs. PANHARD AND LEVASSOR; while an electric delivery lorry was shown by LA COMPAGNIE FRANCAISE DE VOITURES ELECTROMOBILES.

MR. L. MYERSCOUGH has a well-equipped garage at Great Crosby, on the main road between Liverpool and Southport.

## CONTINENTAL NOTES.

### A Motor Meeting in Roumania.

A three days' motor meet has just been held in Bucharest by the Roumanian Automobile Club. The first day was devoted to a gymkhana, while on the second a series of flying kilometre speed trials on the level was held. In the under 20-h.p. class the first place was taken by L. Leonida on an 18-h.p. Rochet Schneider, in 47 2-5 sec., the same gentleman, on a 60-h.p. Gobron-Brillie, winning the over 40-h.p. category in 32 4-5 sec. The victor in the class for cars of from 20 to 40-h.p. was M. Cantacuzene, whose 40-h.p. Mercedes covered the distance in 35 1-5 sec. The third day was devoted to a race from Bucharest to Giurgevo and back, a distance of 75 miles, this being won by J. Camarchesco on a 45-h.p. Mercedes in 1 h. 29 min. 2-5 sec.

### Public Services in Italy.

An electrical motor-omnibus service on the overhead trolley system has recently been inaugurated between Spezia and Portovenere. The route, which follows the coast line, is very sinuous, with curves of 7 metres radius and numerous steep grades. The energy is furnished by the same central station that supplies the

Spezia tramway system, at a pressure of 500 volts. The cars, of which two perform the service, are fitted with 4-h.p. continuous-current driving the rear road wheels through clutches and side chains. The cars, which are electrically heated and lighted, and carry fourteen persons, were supplied by the Società per la Trazione Elettrica, of Milan. The controller allows of four speeds forwards and two backwards, as well as the electric brake.

### Motor Cabs in Berlin.

The first day of the New Year witnessed the coming into force in Berlin of a new scale of fares approved by the police authorities for the horse-drawn and petrol and electric cabs of the taximeter class. The initial or basis fare for the horse cabs has been increased to 70 pfennigs (8 4d.) for the permitted distance without extra payment, that for petrol cabs has been raised from 50 pfennigs (6d.) to 70 pfennigs, and that for the electric cabs remains at 80 pfennigs (9 6d.). In the case of both petrol and electric cabs, however, the maximum distance covered by these fares has been reduced to 600 metres, and to 300 metres for each extra length of route allowed to be traversed for an additional charge of 10 pfennigs (1 1/4d.) per section.

### Public Services in Germany.

A public motor-car service has just been established between Ludwigshafen and Bad Dürkheim. A company is also being formed to run motor-buses between Barmen and Beyenberg.

### Motor-Cars for Travellers.

The Automobile Club of Bordeaux proposes to organise, in July next, a reliability trial of motor-cars specially designed for the use of commercial travellers. It is proposed that the competition shall extend over a sufficient period to allow a distance of 3,000 kilometres to be covered.

### An Automobile Tour of Algeria.

The Automobile Club of Algeria is organising an automobile tour of the country for Easter week. The proposed programme is as follows:—First day, Algiers to Bougie; second day, Bougie to Setif; third day, Setif to El Kantara; fourth day, El Kantara to Biskra; fifth day, rest in Biskra; sixth day, Biskra to El Kantara; seventh day, El Kantara to Batna; and eighth day, Batna to Constantine.

### A Removable Rim Competition.

In connection with the forthcoming automobile exhibition in Turin, arrangements are in hand to hold, next month, a competition of removable rims for the wheels of motor vehicles, provided at least four entries are received. The trial will have regard to (1) the solidity of the system, which will be tested by a run over a difficult road, (2) the facility and rapidity with which the rim can be changed after a spin along a muddy road, (3) the exactitude of the alignment of the rim with the wheel, (4) the weight and the price. Full particulars can be obtained from the exhibition committee, 13, Via Bogino, Turin, to whom entries—for which no fee is charged—are to be sent by the 31st inst.

### Miscellaneous Items.

By order of the German Ministry of the Interior a census is being taken of the number of motor-cars in the Fatherland.—The annual automobile meeting at Cannes is to be held from the 5th to the 17th March.—An automobile club has just been formed at Chemnitz (Saxony).—The Prosper Lambert Company, of Nanterre, France, will in future be known as the Jean-Bart Company.—A chauffeurs' school, established by the Automobile Club of Milan, was inaugurated last week.—What is claimed to be the first six-cylinder car to be sold in Austria is a Brasier, which has been acquired by Herr F. Wagenmann, of Vienna.—The annual hill-climbing competition up Mont Ventoux, France, is not to be abandoned, after all, as the Moto-Club de Marseilles has decided to take the organisation of the event in hand. It will, however, be reserved to touring vehicles.

THE Daimler Motor Co. (1904), Ltd., have sent us a perpetual reminder of their well-known car in the form of an ash-tray, from which rises the outline of the Daimler vehicle—for which many thanks.

WITH the view of fostering the development of electric motor vehicles, an Association of Electric Vehicle Manufacturers has recently been formed in New York. At the first meeting, lately held, a number of interesting papers were read, including one by Mr. H. Eames, on "The Electrical Vehicle: its Past, Present, and Future," and another by Mr. H. Ford, on "Storage Batteries for Electric Vehicles."

AT the distribution of prizes to apprentices at Messrs. Atkinson and Phillipson's, motor body builders, of Newcastle, Mr. William Phillipson said that at the present time they had more orders in hand for motor-bodies than at any previous period, a fact which reminded him of a prophecy made by his father in 1895, when, in his capacity as President of the Institute of Carriage Manufacturers, he said that the carriage builders would be able to provide suitable carriages as soon as the engineers were able to deal adequately with the machinery.

## THE PATERSON DETACHABLE FLANGE RIM.

**D**URING the past twelve months quite a number of detachable and removable rims have made their appearance, all having for their object the saving of time in replacing a punctured tyre when on the road. The two classes of rim are quite distinct, the detachable being one in which the rim is made in two pieces, one of which can be readily withdrawn to facilitate the taking out of the punctured inner tube

The Paterson Detachable Flange Rim.—Above on the left is a section of the tyre rim in position, on the right the removable flange is shown detached to receive the tyre, while below the latter is in place ready for the flange to be bolted on.

and the insertion of a perfect one, and the refixing of the outer cover, without the oftentimes difficult task of inducing the beaded edge of the latter to pass over the upturned portion of the fixed rim. In the removable type, the whole rim is so fitted to the felloe of the road wheel that it can, together with the punctured tyre, be removed and replaced by another rim on which a spare tyre—inner tube and cover—are kept on the car, ready for use in case of emergency. The makers of each class claim advantages for their own particular system, the main point advanced by the "detachables" being that the number of spares that require to be carried on a long tour take up much less room than several spare rims fitted with the necessary tyres. It is, however, not our purpose on the present occasion to discuss the relative merits of the two systems, but to draw attention to a new detachable rim which has recently been devised and patented by Mr. J. H. Paterson, the managing director of the Caledonian Motor Car Company, of Aberdeen.

As will be seen from the accompanying illustrations, the Paterson rim is composed of two distinct portions, the fixed part on the wheel forming the base of the rim, and the permanent tyre clinch on the inside of the wheel. This is fixed in the usual manner by shrinking it on to the felloe and by screws passing through the base to the felloe. In one with the fixed portion is an inverted circular flange about  $1\frac{1}{2}$  in. deep, and of the same section steel. In the flange are fitted at regular

distances round the circle twelve or more bolts with screwed ends. The second part consists of the detachable flange, which is provided with the usual clinch to hold the bead of the outer cover, and has formed solid with it an inverted circular flange about  $1\frac{1}{2}$  in. wide. The latter has twelve or more bolt holes, to correspond with the bolts fixed to the flange on the rim proper. In the case of a puncture or burst tyre cover, all that has to be done is to remove the twelve nuts by means of a brace spanner, and draw off the detachable flange. The tyre cover will then be absolutely free, and the old air tube can be taken out and a new one inserted, or a new outer cover put on. To replace the flange after fitting a new tyre it is necessary to first see that the security studs are above the beaded edges of the cover, then inflate the air tube slightly, fit on the detachable flange, screw up the nuts with the brace spanner, and inflate firmly.

Among the advantages claimed by Mr. Paterson for his detachable flange rim are that it is adapted to take any standard make of tyre, so that replacements can be had anywhere. In case of a burst cover or punctured tyre it is a simple and easy matter of about from two to three minutes to fit a new air tube or new outer cover. The usual security studs are retained, and it is impossible to nip the air tube with the outer cover or the security studs, as, before fitting on the detachable flange, the operator can see that the air tube is above the security studs, and that the latter are above the beaded edges of the cover; while, owing to the formation of the inner and outer flange, it is an impossibility for wet or dust to penetrate inside the rim. Mr. Paterson informs us that arrangements have been made for the manufacture of the detachable flange rims with one of the largest rim manufacturers in Great Britain. They can be had in any size, and fitted to wheels or supplied loose for attachment in the usual way, in substitution of the fixed rims on existing wheels.

## THE FORD STEERING GEAR.

WHEN describing the Ford 15-h.p. four-cylinder car in our issue of October 13th last, we mentioned that an unusual feature of the steering gear is the location of the reduction gear at the upper instead of the lower end of the column, the ease of adjustment being in this way, it is claimed, increased. We are now able to give a part sectional view of the mechanism. The boss of the handwheel A is keyed to the shank B, which at the middle of its length is provided with an integral spur pinion C. The latter is in mesh with a set of small planetary gear wheels D, which latter mesh with internal cut teeth E cut in the bronze

casing F, secured to the steering pillar G. The studs H on which the planetaries revolve are fixed in a flange formed at the upper end of the steering shaft.

MESSRS. FRANK MORRIS, LTD., of King's Lynn, have lately introduced a ball thrust specially designed for fitting to the differential shafts of old-type Daimler and Panhard cars. It is claimed not only to add to the efficiency of the drive, but to keep the driving bevel pinions correctly in mesh, and consequently to reduce the noise made by the gearing.

BETWEEN 1,500 and 2,000 motor-cars are said to be in private use in the Commonwealth of Australia.

LAST year more than 70 Argyll cars were despatched to India and the Antipodes, and at present Argyll Motors, Ltd., have over 50 cars in hand for immediate shipment.

MISS JULIA NEILSON, the well-known actress, has placed an order with Messrs. H. M. Hobson, Ltd., for a 35-h.p. Nagant-Hobson car.

THE Lanchester Motor Car Company have opened a new depot in King Street West, Manchester. Mr. G. J. Crawford is in charge.

A NEW fire station is to be opened opposite the Mansion House Underground Railway Station, London, E.C. The appliances will include a motor fire engine and a motor fire escape.

THE Wheatsheaf Hotel at Daventry, which bears the date A.D. 1610, has good storage accommodation for motorists, and Mr. E. W. Killick keeps supplies of motor spirit for motorists on tour.

THE Walton-on-Naze motor lifeboat has been out daily during the past week visiting the men, lightships, and distributing seasonable literature and gifts. It is satisfactory to note that the motor ran the whole of the time without a hitch.

THE efforts to secure a re-hearing of the case against Lieut. Paton, heard by the Berkshire magistrates, have resulted in a communication from the Home Office indicating that the Director of Public Prosecutions does not see his way to take further action.

A NUMBER of the members of the committee of the Automobile Club of France paid a special visit during the recent Paris Salon to Messrs. Stern's showrooms in Paris, and inspected the Weigel chassis exhibited there. They expressed the opinion that it was as fine as anything that was to be seen in the Salon.

DURING Christmas week Messrs. Pickford and Co. had between eighty and ninety motor lorries at work, carrying parcels from collecting to distributing depots, the business of house to house delivery being entrusted to horse vehicles. Messrs. Carter Paterson and Co. had thirty motor vans at work in a similar way.

WHITTAKER'S Almanac is again before us, published in the familiar form. As a reliable record of the Government and official departments of this country and guide to those abroad this annual year book needs no commendation. The record of automobilism has evidently been conscientiously done, although the letters L. N. might have been added to the motor-car identification marks, a table of which is given. A new feature is the guide to British holiday and health resorts, following which is a directory of hotels, at many of which garages are provided for visiting motorists.

MESSRS. GAMAGE, LTD., of Holborn, E.C., are to the front just now with all sorts of handy devices to relieve motorists of the troubles which crop up in connection with motoring at this time of the year. They are showing a large stock of Crosfield's glycerine anti-freezing mixture, and are also showing motor house safety stoves, which burn "Carbotron," a patent fuel which gives neither spark or flame. Prevention of freezing by these means is to be preferred to letting the water out and running the risk of contracting cracked cylinders during such nights as we have had of late.

MR. VICTOR ASHBY, of the Motor Works, Towcester, informs us that he has just returned from the Continent, where he secured one of the new six-cylinder Mercedes cars. From the information he gathered the vehicle will be the second of the type to reach this country. The car is for Mr. E. E. Whadcoat, who already has three Mercedes—a 45-h.p., a 60-h.p. and a 120-h.p.—besides two cars of other makes. Mr. Whadcoat is a most enthusiastic motorist, yet withal exceedingly careful and considerate to other road users. Doubtless more will be heard of his fleet of cars when the Brooklands track is in trim.

## HERE AND THERE.

THE first prize in the Paris Show Tombola, a De Dion car, has been won by a Parisian working electrician.

UNDER the registered name of "Metometle," Messrs. Peter Lee and Sons, of High Street,

Glasgow, are introducing a specially prepared lubricant for metal-to-metal clutches.

THE death has taken place at Roff-y (Sussex) of Mr. J. R. Grahame-White, who was a founder member of the A.C.G.B.I.

A MOTOR garage and repair works has been opened at Hadleigh, in Essex, by Messrs. Norman and Co., of 143, Roman Road, Bow, E.

OWING to the increase in their business the Electric Ignition Company, Ltd., have put down two new gas engines to drive additional plant.

THE Ivel Agricultural Motor Company has been formed in Jersey City, U.S.A., with a capital of £200,000, to manufacture agricultural motors in America.

THE Right Hon. the Earl of Rosebery has lately ordered a 30-40-h.p. Fiat car. It is to be fitted with a limousine body by Messrs. Rothschild et Fils, of Turin.

ON the main road from Welshpool to Aberystwyth Mr. W. Humphrey has opened a garage with motor repair department. Its exact location is 15, Bridge Street, Newtown.

COLONEL D. KINLOCH is now arranging insurances through Lloyd's which secure the use of another car while that of the policyholder is being repaired.

AMONG the New Year greetings which reached us last week was one from Mr. C. Friswell, who is at present enjoying a holiday in Cairo. He hopes to be back in London by the end of the month.

WE illustrate herewith a useful tool known as the Auto-Adjustable Box Spanner, which has just been put on the market by Messrs. Avery and Roberts, Ltd., of Stanley Street, Liverpool.

The device can be instantly adjusted to any size and shape of nut, so that it takes the place of the usual set of box spanners, thus saving considerable weight and space in the tool box. The tool is strongly made and does not injure the nuts, owing to the jaws fitting the same perfectly; the handle is pivoted so that the spanner, which is being supplied at a relatively low price, can be easily used in otherwise inaccessible places.

THE American Association of Licensed Automobile Manufacturers has adopted a standard size for sparking-plugs—one of 7-8 inch diameter with a straight 18 pitch thread coming up to the shoulder.

THE music-hall performer, who lately created a sensation in Paris by allowing a fully-laden motor-car to run over his prostrate body, will shortly appear on a London stage. Mr. Coram, the ventriloquist, will also introduce a motor-car into his next performance on the London variety stage.

THE value of the exports of motor-cars and parts from the United States during the ten months ending with October last is returned at £778,254, as compared with only £473,924 in the corresponding period of 1905. Great Britain was the best customer, being responsible for £213,108 of the total, Canada coming next with £163,006.

MR. L. FAWCETT has started business in Mark Street, Woodhouse, Leeds, as a motor-car agent, repairer, and dealer in all accessories for motor-cars and vans, including tyres, petrol, oils, grease, &c. The works are equipped with a complete set of electrically driven machine tools, and a speciality will be made of repairs to motor-vans.

IN a recent issue we gave some particulars of an improved form of steering gear for motor-cars which has recently been devised by Messrs. Rose and Catt, of Bournemouth, and we are now able to publish a diagram of the arrangement, which has been designed with the view of reducing the wear due not so much to the actual steering of the car, but to the constant road shocks on the wheels while travelling over uneven ground. In the "Perfect," as the improved steering gear is known, the worm or screw and quadrant are fixed to the usual steering arm which

directly operates the wheels, and the thrust is taken by a bracket firmly attached to the front fixed axle, thus locating all thrusts on the latter, the wear on the universal joints and pins being consequently reduced to that which is caused by the actual steering of the car. Even when wear does occur in these parts the wheels are still held firmly by the screw in the direction required. Additional safety is also claimed by the fact that a breakage or loss of any of the parts between the screw and the steering wheel would not allow the road wheels to lock round of their own accord, as they would be held by the screw in whatever position they were left at the time of breakage. The apparatus also lends itself to being easily made dust-proof. Referring to the illustration, A is a strong bracket firmly bolted to the front axle. The end of the nut B is attached to the ordinary steering arm D, which directly operates the wheel, the journal of the screw C being carried in the end of the bracket A. E and F are shafts for transmitting the motion from the steering pillar to the screw, each having universal joints at one end, while the other end of E is of square section, and telescopes into a square hole in F. G is a strong bracket bolted to the frame of the car, carrying the steering pillar, and a pair of bevel wheels to give a rotary motion to the shafts E and F. Messrs. Rose and Catt have fitted the gear to an old 6-h.p. Daimler car, with a short wheel base, and are open to demonstrate its advantages to builders of motor-buses, the arrangement being one well adapted for use on this class of vehicle.

FOR some time past the U.S. authorities have been testing various makes of motor-cars with a view of ascertaining their adaptability for military purposes.

MR. DUNCAN CAMPBELL is coming south from the North-Eastern Garages to assist Messrs. J. E. Hutton, Ltd., in connection with the sale of the Berliet car.

A PAMPHLET descriptive of their special Lubricating Graphite No. 635, for lubricating motor-cars and motor-boats, has been prepared by the Joseph Dixon Crucible Company, of 26, Victoria Street, S.W.

THE DAIMLER MOTOR CO., LTD., have sent us two photographs depicting the exterior and interior of the new chassis erecting shop which they are building to meet the greatly increased demand for Daimler cars. The new erection is 400 ft. long by 160 ft. wide, but a large amount of adjoining land has been purchased so that further extensions may be made.

THE modesty of Mr. H. J. Weintz, in his Preface to the "Motorist's Interpreter," published by Messrs. Hirschfield Bros., Ltd., is to be commended rather than his knowledge of what is required in such a volume. For among the terms that are absent are such details as the change-speed gear, the gear-box and the sparking plug, while the ignition tube is included in a volume that bears the date 1906. Mr. Weintz should have known that "essence" is the French term for motor spirit, and "arbre villebrequin" signifies crankshaft. His tribute to the motor-car as a means of "ruralising the townsman" deserves quotation, but the price of the work might be reduced and its length extended to the advantage of its circulation.

THE Motiphos Company have removed to 34, New Bridge Street, London, E.C., where they have extended facilities to cope with their increasing business.

THE Executive Committee of the Aero Club of the United Kingdom, at a meeting on Tuesday, decided to issue a challenge for the next Gordon Bennett Aeronautical Cup race, and to send three competitors. The race will take place in the United States.

THE inquest on the body of John Walker, the Burmantofts carter, whose death in the Infirmary last month was the second resulting from the motor-car accident in Roundhay Road, Leeds, on August 17th, has been adjourned to the 21st, when expert evidence will be given.

THE New Leader Motor Company, of Nottingham, have just acquired the premises lately occupied by Cars, Ltd., in Shaftesbury Avenue, London, W.C., and, after the necessary alterations are made, will exhibit there a full range of New Leader cars.

SKINDLE'S HOTEL, at Maidenhead Bridge, was "merry and bright" on the first day of the year, when Mr. A. E. Major, of the Motor Car Depot of Reading (who is also the proprietor of Skindle's Garage), entertained a number of his clients and friends from various parts of the country to dinner. Motor-cars were used to convey the guests to and from Maidenhead and Taplow stations.

MR. W. H. BAXTER, J.P., of Harrogate, has had his new car fitted with a limousine inverted body by Messrs. J. Fowler and Sons, of that town. It is known as the "Harrogate" motor-car body, and embraces many conveniences for touring. There is accommodation for four passengers, three facing and one with the back to the direction in which the vehicle is travelling. The centre one of the three seats is arranged about half the depth of the seat behind the two side seats, with a chair back that can be fixed at any convenient angle to allow the passenger, when there is not a fourth inside passenger, to lie almost straight out, resting his legs on the opposite seat. The back of this seat can be brought right over to the front to form a table. Below the seats are drawers for luggage, &c. At each side of the seat next to the driver are hooks similar to the heads of golf sticks, which fit close to the body of the pas-

View of Gear Box of Aixre Car. (See opposite page.)

senger and prevent any danger of his falling off should the car be stopped suddenly. The glass wind shield, too, is of novel design, being fixed in a A position, supported by the side rods upholding the canopy. This front screen is in two plate-glass squares, which are arranged so that they can be regulated to any angle and to any amount of opening in the centre required. By this opening in the centre upon a wet day the driver can see between the two hinged pieces of glass without getting the full force of the rain.

## THE AIREX 9-H.P. CAR.

A BRIEF reference has already been made in the *M.C.J.* to the new car which, under the name Airex, the Rex Motor Manufacturing Company, Ltd., of Coventry, have recently introduced to meet the requirements of motorists of moderate means. We are now able to give an illustration of the vehicle (Fig. 1), together with a plan of the chassis (Fig. 2), and a view of the gear-box (page 1014). The main frame is of

cardan shaft by means of a claw with three projections, fitted with ball bearings. When on top speed the secondary shaft remains stationary. On each side of the differential casing on the live axle is fitted a ball bearing, which can be adjusted from the outside by means of a screwed cup. The rear road wheels are also mounted on a ball bearing with a double row of balls. The standard body is of the side-entrance double-phaeton type, built of stamped sheet metal, and comfortably upholstered, side-doors being provided to the front as well as the rear seats. The

Fig. 1.—The Airex 9-h.p. Double-Cylinder Car.

pressed steel, the engine and gear-box being carried on a subsidiary one of channel steel. The motive power is supplied by a 9-h.p. double-cylinder V-type engine, the bore and stroke being respectively  $3\frac{1}{2}$  in. by  $3\frac{1}{2}$  in. Two taps are fitted in each cylinder head, one to ease the compression and the other to permit the cooling water to be drawn off when occasion arises. Ignition is by coil and accumulator, the contact-maker being located in front of the framed ribbed-tube radiator, which latter is of a special circular design. The water circulation is maintained

vehicle, which weighs only  $12\frac{1}{2}$  cwt., has a wheel base of 6 ft. 6 in., and an over-all length of 10 ft. 7 in.

A few days ago we had a seventy miles run on one of the new vehicles. The condition of the roads was most suitable for a test, as we travelled in turn over muddy, frozen, and snowy surfaces; but, notwithstanding a varying depth of from 1 in. to 3 in. of snow, the car mounted Edge Hill with little difficulty, and, as showing the efficient control and brake power, we may state that Sun Rising Hill was descended without the slightest

Fig. 2.—Plan of Chassis of Airex Car.

by a chain-driven pump, and a Longuemare carburettor is employed to furnish the mixture, while, as will be seen from Fig. 2, a novel feature consists in providing each cylinder with its own exhaust pipe and silencer. The power is transmitted through a leather-faced cone clutch, provided with stops or brakes to facilitate changing speed, a gear-box giving three speeds forward and reverse, cardan shaft, and bevel gear, to a well-designed live axle. On top speed the drive is direct, the square shaft in the gear-box engaging the

tendency to slide round or skid, although only one of the rear wheels was provided with a non-skid. On the level the Airex car attained a speed of over 30 miles an hour, and can take any ordinary hill on the top speed. The Rex Company claim that as regards petrol consumption the car is very economical, doing over thirty miles on a gallon of fuel.

THE Calcutta motor show will open on the 28th inst. and continue to the 6th prox.

## CORRESPONDENCE

(Letters to the Editor should be addressed to the office,  
87-88, Charing Cross Road, W.C.)

### FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think your readers will agree with me when I state that a discussion with Mr. Edge is unsatisfactory, because he always seeks to evade the real points at issue. My first letter asked for an explanation from him as to why, in the town carriage competition, the six-cylinder Napier only scored over the four-cylinder cars competing on one point, namely, the accessibility in regard to repairs, a point which the genius of Mr. Napier has apparently, and, under the circumstances, very properly, been specially directed to. I am not abusing the six-cylinder principle, but why were the four-cylinder cars pronounced superior to the six in the competition in question on the points of silence, ease of control, lack of vibration, smell, smoke, and the other refinements one now expects in an up-to-date car? I do not care how many makers are making six-cylinder cars; this does not make a six-cylinder vehicle superior to the four-cylinder, when the average man's requirements are concerned—on initial cost, up-keep tyre bill, simplicity and general utility.

Speeding along on a Long Island Highway.

To ease Mr. Edge's mind, I should like to inform him that I am largely interested in a company which is selling six-cylinder vehicles, but this does not affect my opinion. Mr. Max Pemberton recently wrote: "While there are fools waiting on the door-step, so long will six-cylinder cars be made and sold."

Mr. Edge has referred to the result of the hill climb held last summer, and states that the Napier, with its little, puny, insignificant cylinders, beat the massive, magnificent and gigantic De Dietrich. So harrowing was his description of the defeat, that I almost shed tears that a car made by the firm who constructed the vehicle which won the last Circuit des Ardennes race at an average speed of over sixty-six miles an hour should have performed so ingloriously. The ridiculous idea of comparing the merits of the cars by their performances in a hill climb has been exploded long ago with those who have any knowledge of the way in which cars are specially faked up for these events. I have already written my opinion of the practices carried out at these hill climbs—special gears, oxygen cylinders, &c., and I am surprised that Mr. Edge should have referred to one of these climbs as proving anything. One thing he does prove, however, and that is the weakness of his case for his own six-cylinder car.

Again I protest at the unfairness of Mr. Edge in previously misquoting me in regard to British cars, and I think that his withdrawal in his last letter should have been couched in more generous terms. Enough of this correspondence; but it makes me tired to see how many wild and exaggerated things six-cylinder cars are accepted by the uninitiated public, because they are put forward in a subtle and ingenious manner by Mr. Edge. I am still waiting, however, for his explanation of the results of the town carriage competition.—Yours truly,

CHAS. JARROTT.

### SECRET COMMISSIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Considering that the new Act which has just come into force for the prevention of secret commissions would have a considerable bearing upon the motor business, some sections of which I have heard are subjected to this class of blackmail, I asked my solicitors to give me in simple language a statement of how the new Act affects the motor trade. They write me as follows:—

"Prevention of Corruption Act, 1906. This Act, which comes into force on January 1st, 1907, is a very important one in your trade, more especially from the point of view of a chauffeur who is in the habit of demanding or receiving a commission for the introduction of business on behalf of his employer, because as from January 1st, 1907, any chauffeur who accepts any gift or consideration, or attempts to obtain any, without the knowledge of his master, will come within the Act and therefore criminally liable. The Act imposes very heavy penalties, as a conviction may entail a maximum punishment of two years' hard labour and a heavy fine. It is very possible that this Act will not be generally understood by the chauffeurs, and it might be an act of kindness on your part to inform them of the risks they run in even asking for a commission."—Yours truly,

S. F. EDGE.

### THE BROOKLANDS RACING TRACK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—From the interest aroused by Mr. Edge's open challenge for a twenty-four hours ride, and the eagerness of other prominent riders to try issues with him, it is very obvious that the advent of the Brooklands Motor Track will give a great impetus to the sporting side of motoring in this country, and doubtless numerous matches, trials and races will be held at this track during the coming season.

I presume that the two gentlemen who have accepted Mr. Edge's challenge—Messrs. Chas. Jarrott and J. E. Hutton—will be entering four-cylinder cars, and Mr. Edge, I understand, will be driving his six-cylinder model. In my opinion, however, what is wanted to make a really exciting and instructive event is for another six-cylinder firm to enter the arena, so that the exponents of the two types will meet on equal terms and the rivalry between the individual contestants be extended. If I might be allowed to name a firm, I would be prompted to mention the Thames Shipbuilding Engineering Company as representing the latest manufacturers of six-cylinder cars, whilst Mr. Edge would represent the first. Mr. Clifford-Earp, too, under whose supervision I believe the six-cylinder Thames are being manufactured, would doubtless be only too willing to compete, since he was formerly associated with Mr. Edge's company as designer, and as a most successful driver in races and time trials. Should such a four-cornered match be arranged, the interest it would undoubtedly excite ought very closely to approach that displayed in the Gordon Bennett race when this event was decided in Ireland.—Yours truly,

F. M. YOUNG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is one little matter in connection with the new racing track which I trust will not be overlooked, viz., the opportunity that it will present for testing accessories, &c. Important as is the endeavour to attain a high speed thereon, it is far more practical, from the point of view of the minor kind of motorist, that its resources should be developed in connection with the fitments of cars; the illuminating powers of certain makes of lamps; the effectiveness of various non-skids—the importance of which was shown in "C. D. L.'s" recent letter to your columns; the efficiency of speedometers, &c. These are matters of vital importance to the small man who does not want the accessories on his vehicle to prove of great cost and little use.—Yours truly,

THE MOTORIST OF MODERATE MEANS.

### GLARING HEADLIGHTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in both your issues of December 29th and January 5th that reference is made to the glare of headlights, and I would like to point out to those interested in the subject that the Bleriot patent no-glare shades, as now fitted to headlights, entirely obviate the objection raised on this subject. These shades have been already described in your paper, and the firm have a large number of orders in hand. The great advantage, of course, of the shade is that it does not alter the power of the lamp, and that it is absolutely automatic in action.—Yours truly,

N. CHEREAU.

### NON-SKID EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Manning and "D. C. L." I have been somewhat alarmed as to the various non-skids and which are the most effective; but I happened to see a device the other day which does not follow the usual idea of steel studs, and, if the difficulty of teaching the driver or owner of the car in renewing the material of which the surface of the road is composed were overcome, I think a very cheap and effective device has been invented.

It is a strange coincidence that I had been discussing with a

brother motorist the previous day on the advisability of making some grating substance adhere to the tyre as my father used to do many years ago on his boots when gutta-percha boots were worn. On a frosty morning, when he ventured out to business, he usually warmed the soles of his shoes before the fire and rubbed them among the ashes in the grate, which adhered (the ashes, not the grate) so firmly that after walking a number of miles on the slippery ground he would come home with the gritty substance still on his shoes, and thus prevented him slipping.

The device I saw the other day is on this principle. It consists of a band of gutta-percha about 1½ in. wide vulcanized or otherwise affixed in a groove only 3-16 of an inch deep round the tyre, and on this band is embedded fragments of quartz, slag, spar or crushed rock so firmly adhering to the gutta-percha that it grips the road and prevents side-slip without injuring the road and diminishes the liability of mud splashing and dust raising. It appears to be a simple attachment, and the cost very moderate, but the greatest desideratum is that any motorist or his servant can renew the material on the band at the slightest notice and at an expense of only a few pence. It does not affect the resiliency of the tyre, there is no noise, and no attention is needed from the driver whilst in use.—Yours truly,

SAMUEL LEE-SMITH.

### PARAFFIN AS FUEL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was pleased to see "Cycle Mechanic's" letter on paraffin carburettors in the *M.C.J.* of the 22nd ult., and I quite agree with his remarks excepting "starting from cold." The time is not far distant when nearly every car will be fitted with a paraffin car-

I hope to be in a position shortly to write to you more fully, and I join in the wishes of "Cycle Mechanic" and Mr. Pilcher that this question should be encouraged in your columns. I trust you will devote a little of your valuable space to it, as the present cost of petrol places the motor-car out of the reach of the man of very moderate means.—Yours truly,

THOS. E. HENDERSON.

### NON-FREEZING ENGINE COOLING SOLUTIONS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "New Brompton's" enquiry in the last issue of the *M.C.J.*, I write to say that in my experience the best all-round anti-freezing solution is prepared by dissolving five pounds of pure calcium chloride ( $\text{CaCl}_2$ ) in a gallon of warm water. Such a solution mixed in these proportions will not freeze down to 30 degrees below zero; it does not lose any perceptible strength by use and will not precipitate or crystallize. It has a slight corrosive effect upon solder, but not to any damaging extent. I have used a solution of water, wood alcohol and glycerine, and find that commercial glycerine often contains deleterious substances, which play havoc with copper tanks and solder.—Yours truly,

J. R. STEVENSON.

### SUBSTITUTES FOR THE HORN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent A. Fielding enquires as to the working of sirens and other substitutes for the motor horn; I beg to give my

The Chemical and Mechanical Laboratories at the Works of the Daimler Motor Co., Ltd., Coventry. These departments are in charge of specialists from the Birmingham University, who have been specially engaged to supervise the chemical and mechanical testing of all materials used in the construction of Daimler Cars.

burettor. If a carburettor can be purchased which will vaporize petrol, paraffin and alcohol, even if the engine must be started with petrol, it will be given preference to one which vaporizes petrol only. It is very convenient to know that one's engine will run on paraffin if desired.

In your issue of the 29th ult. I note Mr. Chas. E. Pilcher describes his paraffin carburettor. I may say I have had for some time in use a paraffin carburettor somewhat similar, which I did not think perfect enough for patenting. I have greatly improved it since, and can now run on the cheapest paraffin, benzoline or alcohol; if petrol is used a saving of 25 per cent. is effected. I tried this carburettor on a car which gave twenty-two miles to the gallon with its ordinary carburettor, with my device we got twenty-eight miles per gallon, using petrol both trials. When used with paraffin I had not the slightest trouble with dirty valves or plugs. It is similar to Mr. Pilcher's except in having a regulating needle in the sprayer and exhaust heating; where Mr. Pilcher's has a chamber I have tuning for vaporizing. I may say my carburettor is entirely automatic in action, no attention need be paid to it whatever. It has no float chamber.

It was necessity, as ever, which brought the invention to birth. I purchased a second-hand car only to find that the carburettor was minus its interior, the jet merely sprayed into the inlet pipe; as a result the engine heated and the water boiled. I made a small appliance—the principal feature of my new carburettor—and the result was past all expectations. The engine never heated afterwards and ran forty miles without a stop. The power was wonderful; it would climb any hill and the saving in petrol was about 25 per cent. I may say I have not pushed my invention forward, as I do not intend taking out patents until I can "start from cold," which I think I shall be in a position to do in the near future.

experience. In the first place let me say that I do not think the ordinary bulb motor horn will be displaced for some considerable time, and other substitutes (so called) are really more of an auxiliary. I have had a siren, but quickly disposed of it, as it was too slow in coming into action, and the noise was infernal. I next purchased a foot bell or motor gong, and this I have had over a year. It is most effective in getting through traffic in busy towns, and, being operated by the foot, it leaves both hands free. The noise is not unpleasant. I have also had an electric horn, but do not recommend this type of alarm. If used much the cost of platinum points will easily run to 10s. per week. I advise "A. F." to have a good horn and a good bell.—Yours truly,

J. H. H.

### THE STEERING GEAR OF THE 10-14-H.P. CLEMENT BAYARD CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the description given of this car in your issue of the 29th ult. it is stated that "the steering and control gear is all arranged for the driver to sit on the left instead of on the right." It would be interesting to know why the usual practice is departed from, and what, if any, advantages are claimed for the change. Presuming that the gear and brake-levers are fitted for the driver's right hand, they must be in the middle of the front floor space, and these with the steering wheel would absolutely block the way through from side to side. In meeting other vehicles the driver would, unless driving in France, be at a disadvantage on the near side seat, and although it would be possible for the two people in the front seats to alight without passing one another, the

occupant of the off-side seat would more often than not have to do so in the roadway, and this, if a lady, would be an objection. I hope you will give further particulars of this interesting car.—Yours truly,

D.

[We believe the particular car in question is designed for cab service in Paris, in which city there is much discussion as to the proper location of the driver on a car—on the right or left—seeing that the rule of the road in France is the reverse of that obtaining in this country.]

### REMEDY FOR NOISY TOOL BOXES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One of the most annoying things to a driver of an otherwise quiet car is a metallic rattle as if something were loose and shaking about. This is quite often caused by loose tools rattling about in the tool box. The boxes that would appear to cause the most trouble are those placed on the long side steps of the car, though most of them are defective in this respect. When first the car is received the tools are, of course, usually carefully wrapped up in cloth. As soon as the newness wears off, however, these makeshift noise deadeners are thrown away, as being too much of a nuisance. Packing the box full of cotton-waste usually stops the rattle, but is in itself a great bother, as one has to fish around to find the right tool, which always seems to be at the bottom.

As a result of experience I have found the following remedy a very convenient and easy one to apply. Take an old inner tube that is past repair and cut it into strips about two inches wide and of a length a little longer than the box. Then tack one end of the strip to a corner on the inside of the box. Fasten the strip at unevenly spaced points along its length with large headed tacks or screws. The pockets thus formed make very good tool holders. The rubber holds the tool fast against the

What must I do, in a case like this?  
[L'Omnia.]

side of the box, and will not only prevent rattling but also be very convenient, as it is easy to place a tool in the pockets, the rubber having great elasticity.—Yours truly,

BURGESS HILL.

### WHY HIGH-POWERED CARS ARE POPULAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Setting aside the large number of high-powered cars which are bought because some friend often better able to afford it has one, there are, in my opinion, a number of good reasons why these vehicles are increasing in popularity. The high-powered car is, on the average, the well built and reliable machine. Manufacturers as a class desire to produce vehicles which will be a credit to them, and the public is ready to pay prices which increase at a very rapid rate with the horse power furnished. As a matter of fact, the labour and material cost involved in the construction of a powerful car as regards engine capacity increases much less rapidly than does the energy developed by the motor. A 50-h.p. engine costs much less than twice as much to build than does

one of the same type developing 25-h.p. The same is true, to a certain extent, of the other part of the chassis. On the other hand, the manufacturer is better able to do a good piece of machine work and assembling than if he were building a lower-powered car, which must be sold at a more modest price. He is able to add many comforts and conveniences to the high priced vehicle that, owing to the higher proportionate cost, he could not furnish with the small machine. The high powered vehicle is thus, as a rule, the comfortable and convenient car. These considerations cause manufacturers to push the sale of high-powered cars, and they have undoubtedly played some part in retarding the development of the car of good practical design and construction for the motorist of moderate means. The motor agent, too, finds it is not proportionally difficult to sell a costly, high-powered car, and that it is a much better financial proposition, so far as he is concerned.—Yours truly,

LOOKER ON.

### RELIABILITY TRIALS AND HILL CLIMBS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Hitherto the rules governing reliability trials and hill climbs have not afforded steam cars an opportunity of competing on equal terms with petrol cars.

As I presume the authorities under whose auspices these trials are held are probably now engaged on the drafting of the rules and conditions to govern the competitions to be held during the coming season, may I express the hope that the rules will be so drawn as to give steamers a chance of competing on fair and equitable terms with petrol cars, and so afford the public an opportunity of comparing their respective merits.

In view of the greatly increased interest displayed of late by the prospective motorist in the modern steamers, I think the public would appreciate the opportunity of comparison.—Yours truly,

J. BURNS DUMBELL.

### BRAKES AND TRAILERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see you mention in your journal the cases in Manchester in which several drivers have been summoned for not having a brakesman on the trailer. The law, I believe, would not require a man on the trailer if the brakes were self-acting, and I have often wondered why these are not used, as they are simple to fit and always apply themselves at the right moment, and release ditto, thus requiring no attention whatever; and yet firms keep running the risk of being summoned or have the old wind-on type from the motor, the cable of which often breaks through the great strain put upon it if the driver, when going down hill, has to temporarily ease up or stop and does not release it before going ahead again.—Yours truly,

J. SIMMONS.

### ANOTHER IGNITION QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 10-12-h.p. Humber car and have a lot of hill climbing to do. I have a spare E.I.C. coil, and want to know if I could have the two ignitions—I mean to have a separate accumulator, wires, switch, and two plugs, but both of them to work from the same commutator. The plugs are now at the side of cylinder, and I propose putting the other set over the inlet valves in caps, so that when I come to a hill I can switch on the two. Do you think I should have more power, and would it harm the car in any way? I should be glad if you could answer this for me, and also give diagram of connection, if possible.—Yours truly,

C. MAW.

[This is rather a novel proposition, and one which we do not consider would be successful, as it would be almost impossible to get the sparks to occur at exactly the same time in the cylinder even with the same contact breaker, and if one spark takes place a fraction of time after the other it is useless. A better way to obtain more power from a hotter spark would be to use a six-volt accumulator, using four volts for ordinary use, and switching in the extra cell to obtain more power on hills. In this way the extra energy is directed on to the same sparking plug, and the method does away with the trouble and inconvenience of fitting extra plugs and wiring, which would cause trouble in many little ways. The extra accumulator cell can be switched on from a small switch fitted on the steering wheel, and it is then convenient for suddenly stopping the spark in an emergency.]

PARAFFIN AS FUEL.—“E. S. J.” writes:—“Will any of your readers inform me through the *M.C.J.* if paraffin as fuel on motor-cars requires more air or less than petrol?”

HOTEL AT COLCHESTER.—A correspondent calls our attention to the comfortable Red Lion Hotel at Colchester, of which Mr. Rees is the proprietor. There is a repair shop within three minutes' walk of the hotel, and mechanics are sent up to execute repairs at a minute's notice.

SOLID RUBBER TYRES.—Mr. R. J. Harding writes:—“Will any motorist who has used the Swinehart solid rubber tyres on his car give his experience of the same?”

## THE DUBLIN MOTOR SHOW.

THE Motor-car Exhibition at Ball's Bridge, Dublin, organised by the Irish Automobile Club, is likely to do much to foster the automobile industry in the Emerald Isle, and it is gratifying to find the people of Dublin as enthusiastic in this matter as they were in the development of the pastime of motoring. On Saturday the opening ceremony was performed by Lord Grenfell, G.C.B., who was supported by Sir W. G. Goff, Bart., Sir J. C. Meredith, Col. Chaloner Knox, Messrs. J. T. Power, D.L., R. J. Mecredy, Hum Bland, E. White and many well-known Irish motorists. In his inaugural address Lord Grenfell said he had enjoyed the pleasure of motoring many thousands of miles in Ireland and he was naturally most interested in their Show. Motoring in Ireland appeared to be in a slow groove, but under the pioneerism of Sir Wm. Goff and assisted by the great race—the Gordon Bennett Race in 1903—it had now taken root, and every day that they motored down their streets, or even in the country, they met more and more motor vehicles as they passed. It gave him great pleasure to declare the Motor Show open, and he wished it every possible success, and that under the auspices of the gentlemen who had taken it up, it might become an annual event. Sir Wm. Goff, Bart., voiced the thanks of the Irish Club to his lordship for declaring the exhibition opened.

While there are certain noteworthy absentees, the cars on view form a representative display of British, Continental and American productions, the interest being increased by the appearance of several vehicles of Irish construction. Messrs. Alesbury Bros., of Edenderry, King's County, exhibit a small car designed for the use of motorists of moderate means. It has an 8-10-h.p. two-cylinder engine, and is fitted

cars shown include the Horbick, by Messrs. Horsfall and Bickham, the Berliet, by Messrs. J. E. Hutton, Ltd., the Ford Junior, by the Central Motor Car Company, the Adams-Hewitt, by the Dublin Auto-car Company, the Rover, by the Rover Company, Ltd., the Winton, by Messrs. Turner, Bros., Dublin, the Airex, by the Rex Motor Manufacturing Company, Ltd., the Enfield, by the Enfield Auto-car Company, Ltd., the Vulcan and Hotchkiss, by the Irish Motor Car Company, the Orleans, the Clement, Deasy, Peugeot, Delaunay-Belleville, by Messrs. Wayte Bros., Dublin, the six-cylinder Minerva, by Messrs. Arnott and Holloway, Ltd., the Spyker, by the British Automobile Commercial Syndicate, the new 30-h.p. White steam car, by the White Steam Car Company, Argyll cars, by Argylls, Ireland, Ltd., the Reo 8 and 16-h.p. cars, by Reo Motors, Ltd., and the Brasier and Unic vehicles, by Messrs. Mann and Overtons (Ireland) Ltd. Messrs. Booth Bros., Dublin, have a large stand devoted to a display of the latest types of Siddeley and Singer cars, while the exhibit of Messrs. J. Hutton and Sons, of Dublin, comprises the equally well-known Minerva, Darracq and Daimler cars.

Among the novelties in the accessory section is the new substance Elastex, which is intended to take the place of air in pneumatic tyres, and which was fully referred to in our issue of the 22nd ult. Mr. S. W. Phillpott is in attendance at their stand demonstrating the merits and explaining the nature of this new preparation. Price's Patent Candle Company, Ltd., have an exhibit similar to their usual displays at English exhibitions, among the specialities to the fore being Manulav, the motorists' soap, Currolem and Cirogen, while attention is drawn to the new patent sealed tins now sent out by the company. The Vacuum Oil Company have also an interesting display of their well-known lubricants, while new brands are seen in the "Gremontine" motor oils and greases of the Greenmount Oil Works, Dublin. The tyre exhibits include the Continental, Clincher, Dunlop, Michelin and Shrewsbury and

Chassis of the Burke 24-30-h.p. Car.

with an unusually large dashboard, which contains a six-gallon petrol tank, with indicator, a gallon tank for lubricating oil, two cupboards, accumulators, and coil. The four-seated body has been made entirely of Irish wood, and the road wheels are shod with solid rubber tyres. Messrs. Chambers and Co., Belfast, display 8 and 10-h.p. cars fitted with horizontal engines and epicyclic change-speed gear. The Burke Engineering Co., Clonmel, in addition to a range of Astahl cars—6-h.p. and 8-h.p. single-cylinder and 10-12-h.p. four-cylinder—for which they are Irish agents, show a new 24-30-h.p. car assembled in their own works in Ireland and which is consequently attracting much attention. The engine has the cylinders cast in pairs; the transmission is by side chains, and we note that the rear springs are of the three-quarter elliptic type. The well-known Belsize cars are exhibited by Mr. J. Hill, Dublin, the models on view including a 20-h.p. four-cylinder and a 60-h.p. six-cylinder, the leading features of which were given in our report of the Olympia Show. Several well-finished specimens of both the Arrol-Johnston pleasure and industrial vehicles are shown by the New Arrol-Johnston Car Company, Ltd., the former including a 12-16-h.p. side entrance double phaeton and a 24-30-h.p. landaulet and the latter a 20 cwt. delivery van and a 2-ton lorry. Mr. S. T. Robinson, Dublin, the Irish agent, is showing examples of three of the latest Clement-Talbot cars, these including the new 15-h.p. model, a 12-16-h.p. and a 22-24-h.p., all fitted with four-cylinder engines. On a separate stand Mr. Robinson also exhibits a Weigel chassis. The Anglo American Motor Car Company, Ltd., stage specimens of the Cadillac 9-10-h.p. car with horizontal engine, and one of the latest 26-30-h.p. touring cars with four-cylinder vertical motor. Mr. J. Keating, Dublin, shows a selection of Humber cars of both Beeston and Coventry construction. Messrs. W. and G. Du Cros, Dublin, occupy a large stand, their exhibit comprising Swift, Panhard, Austin, Gladiator, and Mercedes cars. Capt. Theo Masui is present with the Germain chainless cars, a notable one on view being a 14-h.p. double phaeton with hood. Other

Challiner, and among the non-skids are the Parsons and the Samson. The show closes to-day (Saturday).

## ALCOHOL AS FUEL FOR MOTOR-CAR ENGINES.

As a result of a long series of careful investigations into the relative merits of petrol and denatured alcohol as fuels for use in internal combustion engines, Professor Lucke, of Columbia University, who has been working in the interests of the U.S. Government, finds that the latter fluid is even more suitable for the purpose than had been anticipated. In his experiments Professor Lucke has used only motors of up-to-date pattern, so that the results may be expected to apply to any modern engine of good design. One of the most striking of his results is, remarks the New York "Motor World," the discovery that, contrary to general belief, alcohol may be used to advantage in the ordinary type of carburettor, and without any alterations in its structure being required. Slight changes in the relative proportions of the fuel vapour and air are naturally necessary, and the greater sensitiveness of the alcohol mixture to atmospheric conditions brought about by changes in temperature and humidity requires a greater nicety of adjustment and a more frequent modification of the settings than is required with petrol.

When the use of alcohol first becomes general, as is now possible in the United States, he recommends that the motorist should fit two tanks to the car, so that for a time the two fuels may be run alternately, and any risks of failure obviated until he has become thoroughly familiar with the peculiarities of the new fluid. Within a short time, however, he believes that as good results will be obtained with one as with the other, the change being merely a matter of adaptation and comprehension of what is necessary on the part of the driver.

As to the specific advantages of alcohol apart from the questions of cost and supply, it is pointed out that the fumes of the exhaust are

neither unpleasant nor unhealthful, that there is little or no tendency to the formation of deposits of carbon or other foreign bodies on the cylinder walls, no condensation upon the ignition points, and no tendency to ignition difficulties other than those which are found in any internal combustion motor of standard construction. In addition to this, the fact that alcohol readily mingles with water adds an element of safety to its use which is by no means to be minimised. For in the event of an explosion of its gas, or the inflammation of any considerable body of the liquid, water may be applied to extinguish it, just as in the case of fire from any other source except that of an insoluble fuel such as mineral oils. This, together with the fact that at present no stringent regulations prohibit the storage of large quantities of alcohol on private premises, forms the keynote of its advantage.

While any petrol motor will run on denatured alcohol, the Professor considers that the low compression engine is best adapted to its use. With high compression it is very hard to start on alcohol. For this reason alcohol is likely to prove excellent for air-cooled motors. Weather conditions affect alcohol much more readily than they do petrol. In very cold weather it would be almost impossible to start a motor on alcohol, and it is possible that on this account it will be necessary to carry a little petrol even should alcohol come into general use as a fuel.

In driving it is found that the alcohol explodes better when the spark is well advanced and the needle valve in the carburettor well open. Knocking in the engine, due to pre-ignition when petrol is used, however, is not noticed with alcohol. In fact, intense heat and an advanced spark even in very hot weather all tend to assist the new fuel to act. In the winter time, Professor Lucke thinks, it will be necessary to use some of the heat from the exhaust to warm the air as it enters the carburettor. Alcohol otherwise will not become a popular winter fuel.

The 20-h.p. Mayfair Limousine, just delivered by the Mayfair Motor Co., Ltd., to His Excellency the Count Henry Lutnow, the Austrian Ambassador in Rome. The body is luxuriously finished. The back seat is particularly roomy, and will seat three with comfort, and there are also two comfortable folding arm chairs. All the latest improvements are fitted, such as speaking tube to the driver, electric indicator on the dash-board, electric light, electric cigar lighter, etc.

In the matter of consumption it is noticed that while more power and greater speed is obtained, alcohol is not likely to be a particularly economical fuel unless it becomes very much cheaper than petrol. In the grain-producing districts alcohol should become very cheap, as the United States Government permits the farmers to produce it if they will combine and guarantee an output large enough to warrant the expense of a Government inspector. As is already generally known, the new American law establishes a certain formula for making the fluid. It must be composed of 100 parts of 90 per cent. alcohol to which is added 10 parts of wood alcohol and one-half of one part of benzine. This is supposed to destroy the fluid for drinking purposes, but nevertheless the Government is going to run no risks. The very closest inspection is provided at distilleries and the fluid must be sealed in cans or barrels. Every retailer must be licensed, without fee, and he must take the name of every customer. The wholesale and retail reports must be made to the Government at stated times and they must tally, to prove that all the fluid made has been consumed as fuel and not re-distilled into pure alcohol.

#### MOTORIST OBTAINS DAMAGES.

SOMETHING of novelty has been found in the case of Gill v. Figg, heard at the Marylebone County Court, a motor-car owner being the plaintiff. Mr. George Gill sought to recover damages from Mr. Thomas Figg, a cab proprietor, in respect of an accident in Cannon Street, E.C., in which one of the defendant's cabs was said to have run into the rear of plaintiff's motor-car and pierced the metal framework. Sir William Selffe awarded £21 damages, with costs, to the plaintiff.

## CLUBS AND ASSOCIATIONS.

### AUTOMOBILE ASSOCIATION.

THE idea of the road sign illustrated on page 985 of our last issue was the fruit of careful study by the Automobile Association Committee, and similar discs have already been fixed at both ends of at least one prominent town or village on each of the fourteen main roads leading from the metropolis. The Association sprung the surprise on the motoring community as a New Year's gift, and the scheme, as yet in its infancy, is likely to prove a real boon to the users of the roads.

### AUTO CYCLE CLUB.

THE Auto Cycle Club, in its capacity as a society of encouragement, has decided to carry out a very exhaustive trial of silencers suitable for motor cycles next month. The judges, in arriving at their decisions, will take into consideration back pressure, noise, facility of attachment, weight and strength, capacity, means of cleaning and maintenance, and cost. Each silencer submitted will be tested under precisely the same conditions on a 3½-h.p. water cooled engine, which has been placed at the disposal of the committee by Messrs. J. A. Prestwich and Co. Any person interested in the subject and requiring further particulars should communicate with Mr. F. Straight, the secretary, Auto Cycle Club, 18, Down Street, Piccadilly, London, W.

The first motor trial of 1907 will be the club's Quarterly Trial, which will be held on the 26th inst., starting from the Chequers Hotel, Uxbridge, at 9 a.m., and going via Beaconsfield, High Wycombe, Dashwood Hill, where the competitors will be timed, Wheatley, Islip, to Banbury, where one hour will be allowed for lunch, returning via Bicester, Aylesbury, Berkhamsted, Chesham, Amersham, and Beaconsfield to Uxbridge, and distance of about 125 miles.

### SOCIETY OF AUTOMOBILE MECHANIC DRIVERS.

WE have just received an official report of the annual meeting of this society, held on November 26th, 1906, at Rawling's Garage, Halkin Street, Belgrave Square, S.W., when the following officers were elected:—President, Mr. Kirkwood; vice-president, Mr. Budd; treasurer, Mr. Groves; committee, Messrs. G. Clarke (chairman), Freeman, H. J. Walters, W. Burgess, C. Randall, J. Gold, Nicholls, J. H. Walters, W. Taylor, F. Randall, Cracknell, and Hughes; secretary, Mr. Percy Loring.

Mr. Nicholls submitted to the meeting a proposal as to an "out of employment insurance" for members, and briefly outlined his scheme, and it was resolved that the committee be requested to go into the matter and report on its practicability at as early a date as possible.

### THE MOTOR UNION.

As a precautionary measure, seven members of the Motor Union have registered a company by the name of the Motor Union, Limited. This registration will have the effect of preventing the name of the Motor Union being used by any other company without its consent. The signatories to the memorandum have entered into an undertaking, agreeing to hold the name and shares of the company at the disposal of the Motor Union, to be dealt with as may be directed by the Committee of the Union.

### THE CYCLISTS' TOURING CLUB.

A MEETING of the council of the Cyclists' Touring Club has been held in London, when, after careful consideration of the whole of the facts, it was resolved not to appeal against the decision of Mr. Justice Warrington, who recently refused to sanction such an enlargement of the memorandum of association as would admit all tourists to membership. The council of the Club from the first made apparent their willingness to loyally abide by the outcome of the recent proposal to broaden the constitution, and they now invite the co-operation of every cyclist in the kingdom in their endeavour to strengthen their organisation.

### SOCIETY OF MOTOR MANUFACTURERS AND TRADERS.

THE Committee of Management of the Society of Motor Manufacturers and Traders finished up 1906 by holding a meeting the last day of the year.

It was reported that the Society's representatives, at their meeting with the Automobile Club on the subject of the Tourist Trophy race, had proposed to the latter that a separate class should be formed, with a petrol allowance such as would permit large cars, as, for instance,

those with a cylinder diameter of 5 in., taking part in the race, and in connection had made suggestions on the alterations which would be required in the regulations for such large cars.

A SILENCER competition is to be held next month by the Auto Cycle Club.

THE membership of the Orange River Colony A.C. has reached the first hundred.

THE annual meeting of the Derby A.C., which Lord Burton has just joined, will be held on the 31st inst.

THE Blackburn Motor Cycle Club has been reconstituted as the East Lancashire Motor Cycle Club, and has become affiliated to the Auto Cycle Club.

MR. PERCY MARTIN, managing director of the Daimler Motor Company, Ltd., and one of the members of the Council of the Institution of Automobile Engineers, has kindly promised to read a paper before the Institution on "Works Organisation" at their March meeting.

A PRESENTATION is to be made to Mr. E. White, hon. secretary of the Irish A.C., for his services to automobilism in Ireland. The Earl of Drogheda presided at a meeting of subscribers in Dublin, this week, when it was decided that the presentation should be made on the occasion of the annual dinner of the club in March.

### ROAD REPORTS.

EPSOM.—At the last meeting of the Epsom Rural Council a letter was read from the Ashstead Parish Council, requesting that a danger signal might be erected opposite the Brewery Inn at Ashstead in such a position that motorists might be warned of the perilous situation arising from the convergence of the Station Road and the Rectory Lane with the main road. It was resolved that the application be forwarded to the Surrey County Council. The Highways Committee reported that Mr. Hue Williams had written stating that his daughter had been knocked down by a motor-car on the main road between his house and the Leatherhead boundary, and calling attention to the necessity for the construction of a footpath along the side of the road. The matter was adjourned for the preparation of a definite scheme.

YORK.—The city engineer of York says that, if there is any general request for the roads in that district to be repaired half at a time, there would be no difficulty in adopting that plan. Our readers in and about the city can assist their *confreres* motoring that way by expressing approval of the system to the local authority.

LEYTON.—Major J. Stewart, R.A., held an inquiry at the Leyton Town Hall on Monday into an application by the District Council to borrow £1,320 for the construction of a new road to the site of a proposed bridge over the waterworks reservoir at Hackney. The clerk, Mr. R. Vincent, said the road was part of a scheme for increasing the highway communication between Leyton and the Metropolis, *via* Hackney, which was the most direct route.

EAST GRINSTEAD.—There is in course of progress at East Grinstead a scheme of improvement which has long been needed. The road out of the town on the way to West Hoathly and Turners Hill is very narrow, and at a point by the cemetery gates two cars can only with difficulty pass. The road is very steep, and at the point it also bends, and there have been many instances of narrow escapes from accidents. On one side of the road some houses are being erected, and the local authority have been successful in getting these set back, and have obtained a strip of land which they are now throwing into the highway. When the work is completed and the road thus considerably widened, the dangerous bend will almost completely have disappeared, and an improvement made of great value to the public as well as to the many motorists who frequent that road.

### ELECTRIC IGNITION FOR MOTORS.

A PAPER was read by Mr. R. W. R. Twelvetrees on "Electric Ignition for Motor Vehicles," at the meeting of the Society of Civil and Mechanical Engineers, held at Caxton Hall, Westminster, on the 3rd inst.

The lecturer touched on the various forms of electric ignition in use, from the accumulator and induction coil to the latest pattern of high or low tension magneto igniters. He also dwelt on the particular advantages of each and its method of working. The magneto-ignition machines are now widely used on all kinds of cars, but the lecturer remarked that it was wise to have a subsidiary method of ignition, such as a battery and coil, in case the magneto apparatus should break down through vibration, or "burning-out," or some other cause. It was pointed out that there might be an induction coil which would work either with a generator or a battery, so that either of these current producers might be connected up with the coil. Thus, if the generator was damaged, the battery could be switched on to the coil in its place, and so there need be no difficulty in continuing to run the engine. Mr. Twelvetrees also described various kinds of ignition points and sparking plugs, as well as methods of insulation which would not be affected by the heat generated in the cylinder.

## CASES UNDER THE MOTOR-CAR ACT.

### RECKLESS DRIVING.

At Kingston, on the 3rd inst., Reginald Aldin Smith, of Albert Gate Court, Hyde Park, W., was summoned for driving a motor-car to the danger of the public at Cobham on December 23rd. P.s. Lucas said defendant was driving at twenty-four or twenty-five miles an hour, and in his opinion that speed was dangerous, having regard to the number of persons who were about. Defendant denied that he was going more than eighteen miles an hour, and said the car was under perfect control. The Bench dismissed the summons.

### NO LICENCE.

At Kingston Police Court, Eugene Hauteux, chauffeur to Mr. Horlick, of Cowley Manor, Cheltenham, was summoned for driving a motor-car without proper lights, and also with driving without a licence. Defendant was going through Kington at 11 o'clock at night, and had only a tail light on the motor-car. He had a licence in his possession, but it had expired on November 9th. Defendant, a Frenchman, through an interpreter admitted the offence, and said a French licence lasted a lifetime. He was fined £5 in each case.

### THE VALUE OF THE SPEEDOMETER.

At the Assize Court, Kingston, on the 3rd inst., the value of a speedometer was demonstrated. On Sunday, December 23rd, Mr. Samuel Smith's, the inventor of the speed indicator, car was being driven by his son through Cobham. He was on board himself, with his wife and mechanic, and just as the car was leaving Cobham two constables rushed out and said that the vehicle was being driven over twenty miles an hour; but Mr. Smith, senior, fortunately had told his son, on entering Cobham, to drive with caution and that the indicator was to be watched, which did not exceed at any time eighteen miles an hour. The constables, when they heard this, seemed to realise that

A Motor Omnibus recently completed by Messrs. Dennis Bros., Ltd., as a repeat order for the Metropolitan Asylums Board. The vehicle, which has seating room for 14 persons, is fitted with a 24-30-h.p. engine and patent worm gear driven rear axle.

their accusation could not be substantiated, and they then said they would report the motorists for driving to the danger of the public. The constables during the cases reversed what they had said on the road, and admitted in cross-examination that nobody was inconvenienced by reason of the way in which the car was driven, and it was distinctly and clearly shown by the evidence that when the police found that their accusation that the car was going over twenty miles an hour was indefensible, they then put forward the more serious charge of driving to the danger of the public. The case was dismissed. Mr. Smith was represented by Mr. Staplee Firth.

### EMISSION OF SMOKE.

Wm. D. Hutchinson, Ratcliffe Road, Knighton Hayes, was summoned at Leicester for using a motor-car in Gallowtree Gate which did not consume its own smoke as far as practicable on January 4th. Defendant did not deny that the car was smoking, but did not admit that he could help it. A fine of 20s. and costs was imposed.

### MOTOR-CAR ACCIDENTS.

DR. A. A. WOOD, a local medical practitioner, was being driven in his trap down Wheat Street, Nuneaton, on Saturday, and on turning the corner to cross into New Bridge Street was run into by a motor-car which was proceeding into the town from the Leicester road on a trial run. The car struck the horse with considerable force, but did not overturn the trap. As the animal did not afterwards move, it was examined and found to have sustained a broken right hind leg, and was forthwith destroyed. The trap was damaged. At the time of the occurrence the motor-car was travelling slowly, the driver having slowed down in order to reverse and proceed along New Bridge Street.

On the Brighton road, between Coulsdon and Hooley, a motor-car was travelling towards London on Sunday night when it collided with a pony and trap. The pony was killed and the trap smashed. The car had to be sent to London for repairs.

## COMPANY NEWS.

**WARWICK WRIGHT.**—£26,200 (25,000 £1 preference and 24,000 ls. ordinary). To acquire the undertaking of Ernest Arnott and Holloway, Ltd., the business of motor agents carried on (inter alia) by Howard T. Wright Brothers, Ltd., and the goodwill of the motor business belonging to Warwick J. Wright. First directors: Messrs. A. Randolph (chairman), J. T. C. Moore-Brabazon (vice-chairman), E. Arnott, W. C. Holloway, and W. J. Wright.

**THE VULCAN MOTOR AND ENGINEERING COMPANY (1906), LTD.,** has been formed to take over the whole of the assets and liabilities of the Vulcan Motor Manufacturing and Engineering Company as on October 31st last. At the general meeting of the latter held on the 22nd ult. it was reported that the sales for the year amounted to £42,796 as against £17,385 for the previous year. The net profit was £7,096. The new company is to have a capital of £75,000, and 40,000 ordinary £1 shares are to be allotted as fully paid to the present shareholders at the rate of four for every one share held in the original concern. Land has been acquired at Crossens, near Southport, where new works will be erected. The directors will be Messrs. T. Hampson, D. Purves, E. Lees, and W. Hamer.

**NON-SKID SYNDICATE.**—£3,000. To acquire the benefit of certain inventions for preventing the skidding of motor vehicles. No initial public issue.

**RUBBER TYRES.**—£2,000 (£1). To acquire the business carried on at Liverpool as Henry Polack, to adopt an agreement with Messrs. J. Mossop, J. Cuninghame and H. Polack, and to carry on the business of indiarubber and tyre manufacturers, &c.

**GROVE EASTBOURNE MOTOR WORKS AND GARAGE.**—£2,000. As title. No initial public issue. Registered without articles. First directors: Messrs. A. J. Bessant and W. T. James.

## PUBLIC MOTOR SERVICES.

THE town of Todmorden now has a motor-'bus service.

THE Ryknield Motor Company, Ltd., have issued an excellent pamphlet giving conclusive evidence of the utility of the motor-'bus for service in Manchester, the result of experimental runs which they have carried out between Cottonopolis and the places round about. It constitutes an effective reply to the critics of the motor-'bus in Lancashire.

AT the adjourned meeting of the conference of Metropolitan local authorities on motor traffic in London, held at the Westminster City Hall on Wednesday, the committee recommended, in order to prevent the congestion of traffic, that the Commissioner of Police be empowered to define the routes along which motor-omnibuses should be allowed to run, and also to regulate the number of omnibuses plying along any route; also that he be urged before licensing motor-omnibuses to see that they are provided with means to prevent grease or petrol dropping on to the roadways. With regard to heavy motor-car and locomotive traffic, it was recommended that the Commissioner be empowered to prevent the use on the streets of any locomotives or traction engines which are unduly noisy, or otherwise unsuitable for road transport purposes, particularly during the night.

THE Harrogate Road Car Company, Ltd., has just been registered with a capital of £10,000 in £1 shares, to carry on the business of motor-omnibus and carriage proprietors. There will be no initial public issue.

AT the meeting of the Eastbourne Town Council on Monday, the Motor Omnibus Committee recommended the expenditure of £3,112 on four new motor-'buses. In moving the motion, which was agreed to after some little discussion, Councillor Killick said that in the winter service seven of the now available eight vehicles were on the road all the day. The Committee wished to work the system as a purely business concern. For the three months ending December 31st the receipts were £271 more than for the corresponding period of last year.

THE Richmond Town Council recently forwarded letters to the Home Office complaining of the incessant annoyance caused to residents in parts of Richmond and the village of Petersham by motor-omnibus traffic on Sundays. A reply has been received stating that the Secretary of State has made inquiry in the matter, but that, under the existing law, he has no authority to prevent the traffic, although every effort is made by the police to diminish the inconvenience caused by these vehicles.

AT the meeting of the New Zealand Land Mortgage Company, Limited, on Monday, the chairman of the directors (Mr. A. M. Mitchison), in dealing with the expenses for the last year, remarked that they had had to remove from their old offices because of the noise created through the introduction of motor-omnibuses. They had no alternative, because the motor omnibuses had come to stop, and the noise was so great that the directors at their meetings could hardly hear themselves speak.

COMPLAINT was loudly voiced at the meeting of the Chesterfield Town Council, on Tuesday, as to the quantity of mud thrown up in one of the narrow streets of the town by the motor-'buses plying between Hasland and Grasmoor. On the Mayor suggesting that a little more attention to the condition of the streets, coupled with a reduction in the speed of the cars, would result in the nuisance being abated, the subject was dropped.

## A SEQUEL TO DUAL OWNERSHIP.

MR. MARK MELFORD, sketch artist, appeared before Sir William Selge, at Marylebone, last week, when he was sued by Mr. William Peck, of East Grinstead, for £10 11s. 8d. The latter stated that the sum he claimed was made up of two items. He and Mr. Melford were the joint owners of two motor-cars—a large one and a small one. When the property was acquired several pounds were spent in putting the cars into order. Some time ago plaintiff and Mr. Melford had a talk, the upshot of which was an agreement that both cars should be sold for what they would fetch. Mr. Melford kept the large car, and the other plaintiff was to take into the country, where there would be a better chance of selling such a vehicle. It was afterwards found that a sum of money had to be spent on repairs before there could be even a hope of selling the smaller car. It was worth about £5, but nobody could be found to give that for it, and so plaintiff now sought to recover half the expenses he had incurred in connection with it and half the £10 which Mr. Melford had obtained for the larger car. Defendant, who described himself as a dramatic author, denied that he had ever given plaintiff any authority to incur any expenses on his account. He had not paid plaintiff his half-share of the proceeds for the sale of the larger car because a promise in respect of commission to be paid to the man who engaged the cars had not been fulfilled. Sir William Selge found for plaintiff for the £5 which had been paid into court, with costs up to the time of its payment.

## CLOTHING AS "PART WAGES."

AT the Clerkenwell Sessions, on Tuesday, a motor-car driver, named Donald Slater, successfully pleaded that he was entitled to the uniform provided by his employer as "part of his wages." Slater, who was charged with stealing a leather-lined motor coat, value £5, from Mr. Eugen Sandow, the professor of physical culture, entered the latter's service in August last, and left on November 30th. According to Mr. Sandow's counsel, Slater took with him the coat in question. Mr. Sandow gave evidence, and said that he did not know of any custom by which chauffeurs retained their livery on leaving situations. The accused, on oath, declared that a chauffeur's livery was supposed to be part of his wages unless there was an agreement to the contrary. The jury returned a verdict of not guilty. The accused was released, and the coat was retained by the police, the judge, although he had no power to make an order, saying that he certainly thought the acquitted charioteer should have it.

## THE LICENSING OF TRAILERS.

AT Blyth, on Tuesday, William Shaw, of Tudhoe Colliery, was summoned for not having a licence for a trailer attached to a motor-cycle, "the same being a carriage within the meaning of the Act." The prosecution explained that even if a bath-chair was drawn by a horse or mechanical power, a separate licence would be required, and that an ordinary cyclist being drawn along the road by a motor-cycle actually came within the meaning of the Act. It was argued that a trailer only required a licence as soon as it was drawn by a horse or mechanical power, not before. In answer to the magistrates' clerk, the prosecution acknowledged that they were unable to quote a case decided before the High Court, as no such point had been raised there. Defendant explained that it was the first time he had had the trailer out when he was stopped by the officer, and pleaded complete ignorance of the necessity for a licence for more than the motor-cycle. The Bench imposed a nominal fine of 1s. without costs.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

## COMMENTS.

**M**OTORISTS are a much-maligned race in this country, but they have a certain amount of liberty—when the Jarretts are asleep and the Marks are resting from the game of hide and seek. Things are even worse in the State of Vermont, U.S.A., than in the county of Surrey, and some Bills have been introduced into the Legislature of that free and enlightened State to “regulate,” i.e., prohibit, “the running of automobiles.” One clause of the proposed

enactment is to the effect that “No person owning or having in charge an automobile or motor vehicle shall run, or allow the same to be run on, or stand in, a public highway between 12 o'clock noon on Friday and 12 o'clock noon on the Monday following.” Our artist has attempted to express the feeling of despair which must come over the man prepared for a rational week-end tour, when told on Friday at noon he had better go to bed till allowed to rise three days hence.

### Motors and the Military.

IN the new Army scheme which Mr. R. B. Haldane is introducing provision is being made for the equipment of soldiers for civil life when leaving the service of their country. In the report of the committee that was appointed to go into the matter some time ago insistence was laid on the advisability of considering the law of supply and demand when selecting the trades to be taught the men in barracks. Hence the selection of the driving of motor-vehicles as one of the subjects of instruction. Courses of instruction are now being carried through at various centres, the men themselves bearing a proportion of the cost of their own training. The subscriptions of the men vary according to the trades taught, the highest charge being that for motoring, where the fee payable is 4s. 6d. per week.

### Highways in Jamaica.

THE highways of the island of Jamaica are a commentary upon the excellence of the British colonial system. During the past fifteen years an effort has been made to create a connected highway system. To that end the roads connecting the coast with the cultivated sections of the island were withdrawn from the control of local boards and a main road system was created under the jurisdiction of an appointee of the governor. While from many standpoints the expenditure of £200,000 for a main road system would not be considered a large amount, yet it must be remembered that the spending of such a sum wholly on the main roads of an island only 150 miles in length implies extended results. The desired material is to be found in every hillside and the cost is further lessened by the employment of convicts in breaking the stone. The roads are the conventional macadam, and, despite the 38 inches of annual rainfall, the tropical sun preserves the equilibrium of the moisture to such an extent that the highways never become disagreeably muddy. There are a thousand miles of macadamized roads on the little island of Jamaica. Wisdom has been displayed in the location of these highways. The island is divided

by a chain of picturesque mountains, and in the case of the railways expensive tunnels were necessary in order to complete the circle of transportation facilities. But in the construction of these good roads the Government endeavoured and succeeded in constructing the highways along the more level places adjacent to the foot of the hills; thus in passing from Spanish town, the ancient capital, through the valley of the Rio Cobre to Bog Walk, the motorist will observe that the grade of the road as it winds along the banks is not insurmountable. Out from Kingston and southerly from Port Antonio the tourists may pass through the groves of the orange and banana, the plantation of the pineapple, amidst a people with whom all in this country will sympathise in the great catastrophe which has devastated Kingston this week. Among the English visitors there at the time of the earthquake were the Hon. Evelyn Ellis, a pioneer of the motor-car in England, and the Earl of Dudley, who, when Lord Lieutenant, did much to further the movement in Ireland.

### The Emission of Vapour.

THE regulations for the Vapour Emission Competition of the A.C.G.B.I., which will be held on March 7th, have just been issued. As we have previously announced, the object of this test will be to encourage the improvement of the design of petrol-driven cars in order to diminish the nuisance caused by foul exhaust. The competition will comprise a road test of about 150 miles and an incline test in which the cars will be observed standing on an incline of about 1 in 7 in each direction for about ten minutes with engine running at normal speed. In arriving at their decision the judges will be expected to take into consideration the following points:—(a) the car which, independently of the skill or care of the driver, gives an exhaust least offensive to the public using the road; (b) the car best constructed to enable the driver, by reasonable care, to obtain continuously an inoffensive exhaust; (c) the best system or device to enable the driver to observe continuously the nature of his exhaust (such as a small by-pass to observe part of the exhaust, or a mirror to observe the whole). Entries for this useful test will be received up to the 14th prox. by the secretary of the Automobile Club, and two awards will be made for the cars which best fulfil the conditions mentioned.

### The Progress of the British Industry.

WITHIN the past few months we have had several opportunities of observing the rapid progress which this country is making in connection with the construction of motor-cars. Among the factories we have visited are those of the Daimler at Coventry, the Wolseley at Adderley Park, the Argyll at Alexandria, and the Clement-Talbot at Notting Hill, the extent of each of which would come as a surprise to those unacquainted with the development that has taken place during recent years. A further striking indication of the advance was afforded us on Tuesday last, when, at the invitation of Mr. S. F. Edge, we had an opportunity of going over the extensive factory which has sprung up at Acton Vale, W., where the well-known Napier cars are manufactured. It appears but a year or so that we were in Mr. Napier's small works in Lambeth, and when he removed therefrom to Acton it almost seemed as if the factory would be sufficient for the

requirements of a long time to come. The popularity of the Napier car, and especially the six-cylinder vehicle, has, however, become so great that to cope with the demand the works have grown out of all knowledge, having developed to three times their original size, while even now further extensions are in hand. Some idea of their extent may be gauged from the fact that 1,200 men are employed daily, and that two completed cars, ready for the road, are now being turned out each working day of every week. Space prevents us from detailing all we saw as we walked through the different shops; suffice it to say that the machine tool equipment is one of the finest we have seen, and comprises amongst others some special machines for the cutting and finishing of bevel gears. Extreme care is taken in the selection and testing of the raw material, while in the attention given to the scrutiny and gauging of the finished parts is found part of the success of the Napier vehicles, the output of which is now being practically confined to six-cylinder models. Subsequently we were shown over the depot and showrooms of Messrs. S. F. Edge, Ltd., in New Burlington Street, W., where some important alterations have lately been carried out, reference to which, however, we must defer until another occasion.

Touring in Italy.—The Church of St. Maria, Pisa.

#### Oil Motors for Cars.

NEXT week we will give the purport of a memorandum which Mr. J. D. Roots prepared for the Fuels Committee of the Motor Union. Mr. Roots is of the opinion that oil motor-vehicles have not come into general use because, in most cases, the use of ordinary carburetors has been attempted. He, on his part, has now secured the mechanical feeding and accurate measuring of the oil for each stroke, but is not at present able to put the improved form of engine on the market. It is twenty-one years since Mr. Roots commenced experimenting, and he has not lost faith in the future of the heavy oil-engine being applied to automobiles, although, as he has just told the Fuels Committee of the Union, the difficulties are so much greater than in the case of petrol engines. The necessity for accurate adjustment is so much more vital to the continued successful working, that instead of the high-speed heavy oil engine for automobile propulsion being a more roughly-constructed engine, as sometimes supposed, it will have to be more carefully adjusted and accurately fitted.

#### Evangelisation by Motor-car.

MINISTERS of all denominations are recognising the merits of the automobile as a means of increasing their sphere of influence and reaching multitudes of people otherwise out of call. The Rev. J. D. Jones, of Bournemouth, not only is fully assured of the advantages that the motor-car possesses for Christian service, but in this month's "Quiver" he declares

himself persuaded that "if the Apostle Paul were alive to-day he would be a motor evangelist." He must have grudged the time spent in foot and sea travel. He was not a motorist only because motors were not in existence." Mr. Jones is quite enthusiastic as to the amount of evangelistic work he is able to do between Sundays, and pleads for the laymen to lend their cars to ministers willing to give their power and force in such work. Coming so soon after the suggestion of the Sheffield preacher that motorists should take ministers to the country village churches on the Sabbath, it would appear that now we may claim the support of another influential section of the community for the motor movement.

#### Friendly Feelings in Nottingham.

THE friendly feeling which prevails between Nottinghamshire motorists and the local county authorities was well evidenced at the annual dinner of the Nottingham Automobile Club, which, thanks to the efforts of Mr. Booth Granger, the hon. sec., proved a most successful gathering. The Mayor (Alderman A. H. Green) set the ball rolling by his imaginary city of the future, in which the rates were reduced by the fines paid for wasting time by those motorists who travelled at less than sixty miles per hour. Mr. H. H. Copnall, the clerk to the Notts County Council, who followed, remarked that the amount received in fines had been very small, and if the members of the Nottingham Club continued to recognise the comfort of other road users the friendly relations between motorists and the county authorities would continue and increase. Perhaps the most striking testimony to this friendly feeling was that afforded by Mr. P. S. Clay, the Chief Constable of Nottingham, who remarked that the only conviction of a motorist in the city he knew was one which took place when he was away on leave! Throughout the evening the greatest cordiality existed between the representatives of the controlling bodies and motorists, the example thus set being one which could be followed with advantage to all concerned in other parts of the country.

#### A Heavy Touring Car Race.

MOTORISTS generally will agree with Mr. Stanley Machin, the deputy chairman of the Council of the London Chamber of Commerce, who, presiding at a dinner of that body—convened for the discussion of Automobilmism as well as the consumption of viands at the Trocadero, London, on the 9th inst.—expressed the hope that the speed of motor-cars would not be entrusted to the local authorities. Considering that there are 1,855 highway authorities in England and Wales, the confusion that would follow such innovation may be imagined; and the retention of the power of limiting the speed of cars in the hands of the central authorities may be regarded as a cardinal point of automobile policy. Lord Montagu, Mr. Sidney Straker and the Hon. Arthur Stanley advocated the motor-car case to the merchants of the City, the latter announcing that the Automobile Club had, in conjunction with kindred associations, decided on carrying out in the late summer a series of exhaustive trials of heavy motor vehicles. This will be on the lines of the Tourist Trophy race for touring cars of a bigger type. In the first instance the proposal was to divide the Tourist Trophy race into two classes, but it has been decided to make the race for heavier cars a separate contest, at all events for 1907. The new contest will be officially known as "The International Heavy Touring Car Race."

#### The Regulations of the Race.

THE decision of the A.C.G.B.I. to hold a competition for heavy touring vehicles on lines that have become familiar in the Tourist Trophy race is a matter of interest in view of the tendency towards large powered machines, despite the protestations of the man of moderate means in favour of the little vehicle that will enable him to get about at a fairly reasonable pace. On page 962 of our issue of the 29th ult. we gave some

particulars of the original event, and the regulations for the new contest are on much the same lines. Some points of difference may, however, be noted. The distance of the Heavy Touring Car Race will be between 250 and 400 miles, but the fuel allowance will be one gallon for every sixteen miles, instead of for twenty-five miles, as in the Tourist Trophy contest. The driving wheels shall not be less than 36 in. in diameter, with tyres not less than 920 mm. by 120 mm. The track will have to be not less than 4 ft. 6 in. The distance from the dashboard to the front edge of the back tyres must not be less than 5 ft. 9 in.; the platform behind the dashboard not less than 8 ft. 6 in. long, and the body must cover this area. There will have to be a clearance of at least 8 in. from the ground when the car is fully loaded. The total load to be carried by the chassis (viz., body, driver and mechanic, ballast, spare parts, spare tyres, tools, luggage, and provisions, but not fuel, water and oil) shall not be less than 2,240 lb., and all parts which remain after the removal of the above load shall be deemed to be parts of the chassis. The load to be carried by the chassis must be brought up to one ton with the help of ballast; wind screens will have to be provided, and specifications for these and the mudguards and other parts will be supplied by the Club.

Our recent illustrations of the many ways in which the automobile is used by the Austrian military authorities confirms the writer's views on its adaptability in connection with field telegraph and telephone operations.

#### The Irish Exhibition.

ON Saturday the Motor Exhibition closed at Dublin, having been visited by a good many people and attracting considerable notice throughout the country generally as well as in the Irish capital particularly. Advantage of the presence of so many motorists in Dublin was taken by the executive of the forthcoming Irish International Exhibition to invite them to see the new building put up in Herbert Park, Ballsbridge. There Sir William Goff welcomed the visitors, descanting upon the many features of public interest that will be found in the display. A great garage will, of course, be provided for those who go by automobile. Now that Ireland is preparing to receive motorists in almost every town (as the provision of garages in connection with leading hotels testifies), the value of the country as a touring ground is being better appreciated.

Motor-Cars at the Meet of the Cottesmore Hounds at Langham.

#### The Motor-car on the Battlefield.

MR. S. F. EDGE is highly esteemed by newspaper editors as one of the most attractive personalities in the motor world, and in "Tit Bits" and "Ideas" he has lately been welcomed as a contributor. From the automobile point of view his contribution to the latter journal was the more notable, for there he gave his views on the utility of Motor Cars on the Battlefield. He briefly enumerated the advantages of the car for the transport of food and materials, to say nothing of its ability to increase the mobility of an army. In this latter connection he suggests that "it is in the transport of troops from one part of the field to another that the automobile will achieve its greatest purpose. The type of vehicle best adapted for this work is the long-bodied car on the char-a-banc principle, each accommodating from thirty to forty men." Mr. Edge also believes in the efficiency of the car against cavalry, representing the automobile as somewhat of a revival of the chariot that wrought such destruction in the ancient days. The employment of the motor-bicycle for despatch work is not forgotten.

#### Still on the Road.

THE Exhibition held in Dublin was of service in securing publicity for the longevity of the motor-car. Thus Mr. James Eadie, of Lisbellaw, informed a journalist that his Daimler car is now in its sixth season, and that it has run 35,000 miles in that period. Shod with solid tyres, the cost of their maintenance has been only £10 a year, while repairs and replacement have not been above £5 per annum. Mr. Guerin, of Dublin; Mr. T. P. Bradshaw, of Clontarf; and Mr. Allworth, of King's County, have all been using the same type of car for six years; while in the four year category Mr. W. R. McTaggart is able to recall Mr. Wentworth Allen, Dublin; Mr. W. Dove, Neath; Mr. R. T. V. Adams, Dublin, who must have travelled well over 40,000 miles. In addition, he knows of cars that originally belonged to the Earl of Wicklow, Colonel Bailward, Kildare, Mr. C. E. Barton, of Annamoe, and others, which are still on the road after five or six years' running. These are Irish experiences. It would be interesting to chronicle a number of British owners who have had their cars in service for periods of five years or more.

**Imports of Foreign Motor-Cars.**

APART from the growth of the home industry, regarding which, unfortunately, no exact statistics as to production are available, proof of the rapid development of the automobile movement in this country is found in the figures relating to the imports of motor-cars. Dealing first with December, this proved to be the quietest month of the past year, but still well in advance of that of the corresponding period of 1905, the official returns showing that no less than 223 foreign-built cars reached the United Kingdom last month, their value being returned at £101,076, which, added to £121,038 of parts, gives an aggregate of £222,114, as compared with only £204,705 in the final month of the preceding year. It is, however, in the figures for the whole of 1906 that evidence of the prevailing activity is found. During that period no less than 5,776 cars were imported, of a value of £2,486,337. To this has to be added £1,885,323 of parts, resulting in an aggregate of £4,371,660, as against £3,367,123 in 1905, or an increase of just over a million sterling. As a further indication of the enormous field the coming of the motor-car has opened up, it may be mentioned that the imports during the past five years have attained the colossal sum of over thirteen millions—£13,019,051, to give the exact figures.

**Exports of British Motor-Cars.**

WHILE, of course, British manufacturers are turning out a much larger number of cars than at any previous time, some years must elapse ere they can be in a position to cope with the home demand, not to speak of the building up of such a large export trade as our neighbours across the Channel have achieved. Still steady progress is being made, and although, in comparison with the import figures, our exports are insignificant, yet they show a very satisfactory increase. Thus last year we exported 1,380 cars, valued at £495,939, plus £324,081 of parts, giving an aggregate for 1906 of £820,020, as contrasted with only £501,802 in 1905 and £321,002 in 1904.

**Manchester.**

ATTRACTED partly by the prosperous state of the main industry of the County Palatine, there has been quite an automobile invasion of Manchester, and all the leading streets now bear evidence of local developments in the motor-car industry. In fact, next to the Metropolis, Manchester is being claimed by many as the best market for motor-cars in the kingdom, and the number of firms that have lately opened depots there would seem to indicate a growing local demand. Following so close upon the revival of the prosperity of the staple trade of the district the present movement of motor traders towards Manchester is undoubtedly well timed.

**A Motorist as Author.**

MR. CHARLES IGGLESDEN, of Ashford, whose "Saunter through Kent with Pen and Pencil" has just been published, is an ardent motorist. The topographical work he has had in hand for the past ten years naturally takes him to the most outlandish places, and his friends chaffed him when he decided to utilise a motor-car for travelling about. But, on a 4½-h.p. Renault, and then on a 10-h.p. car of the same make, he has found his labours lightened to the utmost degree, neither muddy and narrow lanes, field tracks, nor even ploughed fields being too bad for traversing. He has found that where a bicycle or cart can go—so long as the path be wide enough—a motor-car can make its way. And the result is seen in the charming volume before us, wherein he describes with pen and pencil such picturesque spots as Cranbrook, Bilsington, and Woodchurch, which are full of historical and architectural interest. The book is written from the antiquarian rather than the motoring point of view, but many owners of cars who know the delightful villages of Kent will dip with zest into these pages, which have had the advantage of revision and corroboration since they first appeared in the "Kentish Express," of which the author is the accomplished editor.

**Accessibility and Cleanliness.**

ON Wednesday, before the Institution of Automobile Engineers, Mr. F. L. Martineau read a paper on Accessibility and Cleanliness in Motor-cars, and the best means of attaining them. His view was that the body should be easily raised or moved, so that all the running gear can be easily and efficiently inspected. The maximum wheel base capable of being easily handled and utilised in all districts was 9 ft.; a really comfortable landaulet body would have to be of the same length from dash to back. To render every part accessible the body should be made to rise on hinges at the back. To inspect the engine and gear-box separately the front and back floorboards should be removed; and Mr. Martineau proposes that they should be made to slide out of the way under the seats instead of being lifted. At the same time, they should be arranged so that they will lift up with the body. Other interesting points are being dealt with as we go to press, and further reference to the subject will be made in our next issue.

**A Reply.**

EARL RUSSELL is one of the watchful defenders of Automobilmism, and his rejoinder to Mr. Lowes Dickinson's article on the Motor Tyranny in the "Independent Review," which appears in the January number of that varied magazine, is a restatement of the arguments which motorists have used over and over again against critics of our policy. He does not attempt to deny that the speed limit is often exceeded, and boldly asserts "that every motorist upon the road, from His Majesty the King downwards, habitually exceeds the speed limit of twenty miles an hour." And then he shows that a law which is universally broken and is generally regarded as absurd must be a bad law, or, at least, serve to bring law-making into contempt. At the same time the vigour of Earl Russell's onslaught into the camp of the enemy has enabled the Editor of our excellent contemporary to make a sly remonstrance against the use of the word "anarchists" as applied to the boys and girls who—driven off the grass and the woodland turf—play in the road after school; and the old men who on summer evenings chatter and loiter in the village streets.

A SIX-CYLINDER Brooke car has been shipped to Melbourne to the order of the Tarrant Motor Company, who are the agents for Brooke motors in Southern Australia.

WHAT is stated to be the largest contract in the history of the automobile industry has just been arranged, an order for 4,000 motor-cabs having been accepted by the Darracq Co.

THE Century Motor Company will shortly occupy a showroom in the High Street, Kensington, making a feature of the Clyde car, for which they have secured the agency for London and the south.

AN Ordnance Survey map of the Isle of Man, prepared on a scale of two miles to the inch, has just been published by Mr. T. Fisher Unwin. It should prove of value to all motorists actively interested in the Tourist Trophy race, as well as to the general body of pleasure seekers in Manxland.

IN connection with our reference to the new works of Messrs. Straker, Squire and Co., in Nelson Square, Blackfriars, we referred to the long distance trial of the 25-h.p. Straker-Squire C.S.B. car, which was to be carried out by the A.C.G.B.I. This was successfully undertaken in October and November, and the certificate of the Club with its review of the performance of the vehicle during its run of 4,010 miles has just been issued. The trial occupied twenty-three days, the averagedaily mileage being 174.5 with an average of 15.1 miles to the gallon, despite the rough condition of many of the roads travelled and the adverse climatic conditions on many occasions. When the vehicle was dismantled and examined by the experts at the conclusion of the trial the whole of the mechanism was in remarkably good condition with the single exception of the ball bearings at the near end of the driving axle. Messrs. Straker, Squire are to be congratulated on the result of the long journey.

## Why Motorists Have Trouble.

EXPERIENCE HAS SHOWN THAT IN A LARGE NUMBER OF CASES THE TROUBLES EXPERIENCED BY MOTORISTS IN THE OPERATION OF THEIR CARS ARE DUE TO THEIR OWN WANT OF KNOWLEDGE OR CARE OF THE VEHICLES. THE MANUFACTURERS ARE, HOWEVER, FREQUENTLY BLAMED FOR ANY IRREGULAR RUNNING, AND AS THE RESULT OF THE COMPLAINTS FOCUSED ON THEM THEY ARE NOT ONLY ENABLED TO DISCOVER ANY PARTS OF THEIR PRODUCTIONS WHICH DO NOT PROVE SATISFACTORY IN PRACTICE, AND TO REMEDY THE SAME, BUT ALSO TO GAUGE HOW FAR THE DIFFICULTIES EXPERIENCED BY USERS ARE THE RESULT OF THEIR OWN INATTENTION. WITH THE VIEW OF GIVING OUR READERS THE BENEFIT OF THE MANUFACTURERS' KNOWLEDGE, WE RECENTLY ADDRESSED THE QUESTION "WHAT DO YOU CONSIDER IS THE MOST COMMON FAULT OF MOTORISTS IN HANDLING THEIR CARS, WHEREBY THEY HAVE UNNECESSARY TROUBLE?" TO A NUMBER OF LEADING FIRMS, AND HEREWITH APPEND SOME OF THE REPLIES WE HAVE RECEIVED.

### The Albion Car.

There are very few points about the Albion car which require adjustment beyond the ordinary grinding of valves, &c., but we find that a number of drivers of our cars are ignorant of the importance of properly adjusting the ignition make and break gear. The adjustment for this is extremely simple and can be made in a few minutes, but there is a considerable amount of indifference shown by the average driver to the importance of this adjustment. For this reason we have lately produced a handbook on the Albion car, which we are issuing with all the vehicles of our manufacture, detailing the various adjustments which should be made to keep the engine in good running order. We have also issued a pamphlet giving instructions as to the adjustment of the Albion magneto ignition, an extract from which follows:—With the

ignition plug removed the rod operating the plug should drop exactly  $\frac{1}{8}$  in. from the highest position to which it is lifted by the cam, to its lowest position. If the length of drop is less than this, the platinum points in the plug will not be held sufficiently far apart, and if the drop is appreciably more than  $\frac{1}{8}$  in. the ignition rod will come down on the cam and cause a tapping noise. If incorrect, this must be adjusted by putting thin washers under the "buffer" or lower spring if too long, or on the top of the "driving" or upper spring if too short. These springs are inside the steel columns supporting the striking rod. The ignition hammers, if of the solid type, should be set exactly  $\frac{1}{16}$  in. clear of the ball end of the wiper on the ignition plug immediately before the striking rod is released by the cam. If of the spring buffer type, they should be so adjusted that the buffer striking spring is quite free and has a very slight end play immediately before the ignition rod is released by the cam (see A, Fig. 2). The setting of these ignition hammers is most important, as it is necessary that the ignition rod should deliver a sharp tap to the ball on the wiper spindle and the ignition plug to ensure a sharp break. If the clearance is greater than the above specified amounts, the contacts will not be pulled sufficiently far apart to give a good spark, and will be apt to burn the platinum. The ignition tie springs must be thoroughly clean, so that they make a good electrical connection between the wiper spindle and the frame work of the engine. For the same reason the wiper spindle and its cross head, taper pin and nut must be kept thoroughly clean.

### The Lanchester Car.

One or two of the commonest faults amongst drivers in handling Lanchester cars of the two-cylinder type are as follows:—If the driver runs with too rich a mixture, he is liable to soot the sparking plugs and thereby cause a short circuit or

defective ignition. Many drivers are not sufficiently careful when replacing ignition wires in the low tension sparking plugs to see that the wire beds properly on its pressure seat. A leakage past the wire is liable to blow the spark out and cause ignition failure, and even if it does not actually prevent ignition, it is liable to cause slow combustion, and consequently loss of power. Again, if the hot gases are allowed to blow past the pressure seat of the wire they will burn the wire away in 100 or 200 miles, after which it may be necessary to fit a new bush as well as a fresh wire. Drivers frequently have a tendency to hang on to the top gear too long when hill-climbing. This is likely to prevent the car from climbing a hill on the second speed that it otherwise would climb on that gear, as keeping the top speed in slows the engine down to such an extent that when the gear is changed the motor does not pick up speed again, and the driver in consequence has to drop to the lowest speed. Driving on the top gear at too slow a speed also causes excessive wear on the suspension links and joints. When using the reverse, a frequent fault is that the driver accelerates the engine and moderates his speed by slipping the friction blocks on the gear drum. This causes rapid wear on the blocks, which entails frequent adjustment, or else the driver finds that his reverse gear does not grip. Many drivers never give a thought to examine the running gear of their cars. If the front wheels are allowed to run when out of adjustment, the life of the ball bearing may be very short. This bearing should not be kept absolutely tight, but the amount of play should be only just perceptible. It is advisable now and again to test the back wheels on the live axles and see that they are tight. This applies particularly to a new car after it has been running 400 or 500 miles.

### The National Car.

"To answer your question," remarks Mr. P. Lamb, "is rather difficult, but it may interest you to hear that I have some complaints against drivers of 'National' cars. This car has had considerable attention paid to its design, to entirely, if possible, eliminate troubles arising from either inexperience or carelessness on the part of the driver; but, however much one considers designing a "fool-proof" car, there are always those who, in spite of everything, will drive a car in anything but the right way. The use of the variable petrol jet seems to be a neglected feature, but why I cannot say, because it is conveniently controlled by a small lever on the face of the steering column. We hear some drivers say that their consumption is eighteen miles to the gallon, and others that it is twenty-two, as the case may be, but careful and considerate drivers accomplish a much more favourable average. Owners driving themselves seem to get the best results; in fact, quite recently Sir Charles Knox drove a distance of over sixty-three miles on two gallons of petrol with his car fully loaded; and I performed what I believe to be a record run, for a water-cooled engine, some few months ago, by driving a standard 18-22-h.p. three-cylinder car over seventy miles on two gallons of petrol. I mention these facts, as both instances can be proved, simply to illustrate that a careful driver ought to get good results from this small but somewhat often neglected petrol economiser, which is the only point that any complaint can be made, as a fault in handling a 'National' car and the trouble arising from this neglect might cause slight loss of power, and, what may be worse still, expensive running."

FIG. 1.

FIG. 2.

### The Hotchkiss Car.

The London and Parisian Motor Company, Ltd., write that a few of the troubles that we have had recently reported to us which have been the cause of Hotchkiss cars stopping are as follows:—"The driver, through not keeping the car very clean, got a lot of oil on the ground wire of the magneto. We sent a man to Yorkshire, and he disconnected the wire and cleaned it, and the car was again perfect. Another trouble was that the vent hole on the top of the petrol tank was blocked up, and the car would go for a little while when flooding the carburettor, and then suddenly stop, and then start again after waiting a short time. In one or two instances we have found that the gauze in front of the carburettor was blocked up, and the petrol could not get to the carburettor. If a client buys a Hotchkiss car we generally have his mechanic at our garage and give him full instructions, and this, we suppose, is why we do not have very much trouble."

### The Peugeot Car.

Mr. C. Friswell considers that with regard to Peugeot cars, like many other first-class vehicles, the greatest trouble comes about through the want of knowledge of the drivers. The machines to-day are so reliable, and they are driven for such long periods without trouble, that the drivers think it only a matter of course that they should run without attention, the result being that when some slight mechanical adjustment is necessary—although only a few minutes' work when diagnosed—often causes hours' delay on the road, simply because the drivers are so unfamiliar with their machine that they do not know how to diagnose the defect.

### The De Dietrich Car.

The only trouble which we find with the De Dietrich, writes Mr. W. M. Letts, is, that although the drivers handle and look after their cars very well, they are inclined, because everything seems to run right, to neglect lubrication, that is they leave too much to chance, imagining that because the lubricator is working right one day it is working the same next day. I would summarise my answer to your query by saying:—Carelessness in seeing that the car is properly lubricated.

### The Wolseley Car.

The most general cause of trouble with "Wolseley" cars is due to motorists running with the ignition set too early, thus putting an unduly heavy strain on the motor. We have also noticed a tendency to run the engine too slowly. Apart from these two points we have, state the Wolseley Tool and Motor-car Company, rarely had occasion to advise our clients in the proper care of their cars.

### The Speedwell Car.

Mr. Dew, of the Speedwell Motor and Engineering Company, Ltd., reports that the chief trouble, in a general kind of way, in the management of the Speedwell cars is that insufficient attention is paid to keeping the accumulators fully charged.

### The Brooke Car.

"Frankly, we do not get very much trouble," writes Mr. Mawdsley Brooke; "in fact very, very little, but if we do get trouble it is invariably from want of lubrication. We think this sums up the whole situation."

LADY ELLIOT has just ordered one of the new Sheffield-Simplex 45-h.p. six-cylinder cars, with a limousine body.

MESSRS. G. M. MONNET AND CO., who are agents for Messrs. Mestre and Blatge, have removed from Oxford Street, W., to 20, Store Street, Tottenham Court Road, London, W.C.

A NEW garage with accommodation for a dozen motor-cars has been opened in connection with the Hotel Burlington, Boscombe. It is in the hotel grounds opening on to the Sea Road near the Pier.

AMONGST recent purchasers of New Arrol-Johnston cars is the Marquis of Breadalbane, K.G., who has just been appointed Keeper of the Privy Seal of Scotland. Sir Francis Ley, Bart., has also ordered a 12-15-h.p. wagonette.

## A SIMPLE ACETYLENE GENERATOR AND LAMP.

THE following account of an acetylene lamp and generator I made last winter and have had in use for some time may be of interest. Acetylene lamps are expensive things, some costing £5 or £6. I had used acetylene for three or four years for the optical lantern, employing a generator of my own device, which was described in one or two photographic papers about three years ago, but as this had a rising gas holder it was not suitable for a car.

The accompanying diagram shows the car generator. The tank A is 5 in. square and 10 in. high; the top has a circular hole  $3\frac{1}{2}$  in. in diameter. The bell B, which contains the carbide holder, is open at the bottom, it is  $3\frac{1}{2}$  in. in diameter and reaches to within about  $\frac{1}{2}$  in. of the bottom of the tank. A tube fixed in the top, with a stop cock, takes the gas to the burner; a wire is soldered across this tube, on which rests a wad of cotton wool to prevent any water passing to the burner.

The carbide is placed in a tin cylinder C 3 in. diameter and 7 in. high. Three or four holes are pierced in the bottom of the tin to let the water in; the carbide is in layers with discs of wood intervening; this prevents all the carbide getting wet at once. The holder is fixed in the bell by a spring, shown at D, made of a strip of brass bent into a circle; by pinching the end with the fingers it is inserted in the bell. The carbide holder is really an old coffee tin; a second is kept in reserve in the car and

it can be put in in two or three minutes when the first charge is exhausted. The bell is kept in the tank by two screws and thumb nuts at opposite corners of the tank. This is not a tight joint, so that any superfluous acetylene thereby escapes. The tank is half filled with water; as gas is generated it forces the water out of the bell holding the carbide and gradually works up as the carbide is used. The lamp I use is an old oil one which cost 5s., but the glass, being too near the flame, continually broke, so a curved glass was placed further away and kept in position by a brass spring covered with asbestos yarn, which allows for expansion and contraction. The lamp acts well and gives but little trouble. The generator, including some alterations to fit it to my present car, only cost about 15s. It is made of galvanised iron, and, although it may not last as long as a brass generator, by the time it is worn out we may very likely have some improved light for motor-cars.

JOHN HENRY KNIGHT.

THE Manchester students' section of the Institution of Electrical Engineers have just paid a visit of inspection to the works of the Belsize Motor Car Company, at Clayton, Manchester.

WILLINGS' Press Guide is now in its thirty-fourth year—evidence of its worth, and, in these days of many papers, necessity. It is published by Messrs. James Willing, Junior, Ltd., and is both accurate in information and easy of reference.

## SOME NEW SELF-STARTING DEVICES.

A NOTEWORTHY and interesting feature of the recent Paris Salon were the self-starting devices exhibited by Renault, Fiat, Isotta-Fraschini, Cinogene, Saurer and other concerns, the first four of which have already been dealt with in these pages. The arrangement fitted to the Saurer cars consists of a small air compressor, having very much the appearance of a motor-cycle engine, and driven off the shaft between the clutch and gear-box. The compressor is in direct connection with a steel reservoir into which the air is driven. The engine is started by means of a lever which opens a valve admitting the compressed air to a rotary horizontal distributor situated in the centre of a hollow yoke pipe, connected with each exhaust valve cap. The distributor is driven by a vertical spindle operated by bevel gear off the camshaft. Of course a hand valve is also fitted to screw down and prevent any leakage after the engine has been started. In addition to starting the engine, the air compressor, which is driven through a clutch so that it is only worked as desired, can be employed to inflate the tyres and also to blow a syren.

Special interest centres in the Letombe device of Messrs. Torchon and Meunier, of Paris, in that not only is it being taken up by Messrs. De Dietrich and Co., but also that it took the first place in the recent competition of engine-starting devices held by the French Academie des Sports. As in most devices of the kind, the Letombe is one in which the engine is set in

Fig. 1.—The Letombe Self-starter as fitted to a De Dietrich car.

operation by means of compressed air, the latter being forced along the pipes E F and steel reservoir G (Fig. 2) at a pressure of about 400 lbs. per square inch by means of a small compressor driven by gearing or chain off one of the cam shafts. Within the distributing chamber, which is cast in one piece with the compressor, is a rotating disc pressed up against a fixed plate in which four ports are cut. The disc is allowed a small lateral movement, controlled by a light spring, in order to eliminate friction when the starting effort is not required. To start the motor a spring-controlled valve B on the dashboard is opened, thereby admitting the compressed air to the distributor box, and pressing the rotating disc against the distributor proper. The disc has a port cut in it, which passes in turn in front of each of the four ports in the distributor leading to the different cylinders. The ports are so arranged that the compressed air must enter one of the cylinders, no matter in which position the crankshaft may be, and no sooner is the air cut off from one cylinder than it enters another. Communication between the distributor and the cylinders is made by a copper tube L, enlarged to contain a check valve at the joint with the explosion chamber, in order to prevent the hot exploded gases passing into the distributor, provision being also made to automatically cut off the supply of compressed air as soon as the engine starts work. The air-compressor is also provided with a small piston in its cylinder

head which acts upon the air inlet valve so as to hold it open, and so cause the pump to work idly as soon as a given pressure is reached in the reservoir, leakage from the latter being prevented by a screw-down valve A on the dashboard. In the ordinary way the engine can be started by a single push on the

spring-controlled valve B, thus using but a small portion of the compressed air charge, the full capacity of which is equal to rotating the engine crank-shaft twenty-five times.

The Lemale automatic starter made by M. Lemale, of Suresnes, consists of a spring contained in a cylindrical box A

Fig. 3.—Sectional Elevation and Plan View of arrangement of Lemale Automatic Starter.

(Fig. 3) at the front of the engine crank-shaft, to which it is connected in a special way. To start the motor, a lever B on the dashboard is pulled forward, which allows the spring to unwind and give five sharp revolutions to the crank-shaft. Once the engine is running, it rewinds up the spring—when the lever

is returned to its normal position—provision being made that no overwinding can take place.

The Universelle engine starter of Messrs. Bossu, Erlotti and Co., of Courbevoie, consists of a dynamo driven off the crank-shaft of the engine. It is employed to keep a small battery of accumulators fully charged; the current of the latter being employed, when it is desired to start the engine, in driving the dynamo, which then acts as a motor. It is claimed for the Universelle arrangement that it not only also keeps the ignition accumulators fully charged, but that the lamps of the car can be lighted and the interior of the vehicle heated electrically.

The German Daimler Company have recently secured patents for an automatic motor starting arrangement, details of which are given in Fig. 4. The apparatus comprises a petrol sprayer, a distributing valve for supplying combustible mixture to the cylinder that may be in a position for firing at the moment, a commutator disc operated from the cam shaft of the motor, and an indicator disc connected to the commutator

Fig. 4.—Details of Mercedes Self-Starting Device.

disc, and showing the position in which the distributing valve must be placed, that is to say, into which cylinder the charge must be pumped. With this system it is important that the device should not be placed in communication with any cylinder the valves of which are open at the instant, and this end is attained by means of the distributor valve. A current of air under pressure, supplied by a hand pump, for instance, issues from the nozzle at the end of the tube A and enters the petrol reservoir B, which is provided with a sprayer or atomizer, and forces the combustible mixture into the distributing valve C, which is connected with each of the cylinders by the tubes D, F, G, H. The stem I of the distributor valve terminates in a handle K, by means of which the valve may be so set as to place it in communication with that cylinder in which the valves are closed. The ignition is then effected in that cylinder, the spark being "distributed" to it by means of the commutator disc M, which is operated from the cam shaft by means of

a chain wheel N and chain O. With the commutator disc turns the indicator disc P, which shows in an opening in the casing Q the number of the cylinder that should receive the charge. The handle K of the valve is then moved to the corresponding number on the case, for applying the charge to the desired cylinder, after which the spark is caused to pass. The charge enters the cylinder through a small valve, the spring of which is calculated to resist the greatest degree of vacuum existing in the cylinder. The sparking plug is placed in proximity to this valve, in order to facilitate ignition—in fact, both the valve and the plug are fixed in one of the cover plugs over the regular valves of the motor. The charge is ignited by a spark furnished either by an auxiliary accumulator and coil or by a hand-operated high tension magneto.

### SOME USEFUL NOTES.

THE distributor in high tension magnetos, or high tension systems where only one coil is used, occasionally needs attention. Dirt, bits of the brushes, &c., are liable to cause misfiring if the distributor is not occasionally wiped out.

AN ignition trouble not always immediately ascertained is the short-circuiting of high tension wires. This is particularly liable to happen when the four or six wires are packed tightly into a tube; in spite of the tube, wet and oil eventually destroy the insulation, and bad short-circuiting is the result.

SHACKLE-PLATES and bolts rarely come in for the attention they deserve. Most cars are now provided with either oilers or greasers for these bolts; but it is not enough to oil them only and never think any more about them. The plates and bolts should be examined, say, every six months, because wear takes place in both. It is sometimes scarcely understood that in a pair of shackle-plates the plate and bolts are to all intents and purposes one piece, as the bolts should not turn in the plates, the spring moving on the bolt only.

AFTER a long period of service the water circulation system of a car may require some looking over. It is a good plan to thoroughly wash out the same with water; by breaking a joint in the piping and attaching a hose to one end, water under pressure may be forced through the radiator and the engine jacket and piping. A considerable amount of rust and fine mud will usually be washed out. During this operation the draw-off cock in the bottom of the radiator and in the engine jacket or at the pump (if such are fitted) should be opened.

It should always be kept in mind that the distributor of a high tension magneto ignition can be easily coupled up to a single-trembler coil and accumulator in the case of a break down. Take the high tension wire from the coil and connect it to the centre (feed) terminal of the distributor. The positive wire of the battery goes, as usual, to the battery connection of the coil, the negative being earthed; earth also the remaining terminal of the coil. Of course this arrangement is not good for the coil, as the trembler is going all the time, but it is only intended to be used in the case of a breakage inside the magneto.

If there is a leak in the cylinder and there is no sound of hissing around the sparking plug when the starting handle is turned the leak is probably in the exhaust valve or in the piston rings. If examination shows the exhaust valve to be tight, probably the piston rings are at fault, either through being worn loose or through one of them having become broken. A broken ring will generally make itself heard by a distinct clicking noise when the motor is running. An effectual way to determine whether the leak is due simply to the rings being worn is to squirt a small quantity of oil on the piston, which, in the case of a vertical engine, is easily done, and makes the piston perfectly tight while it lasts. Too much oil must not be used or there will be trouble in getting rid of it when the engine is to be started and operated under its own power.

## CONTINENTAL NOTES.

### The Brussels Automobile Exhibition.

The fifth annual Belgian *Salon* was opened in the Palais du Cinquantenaire, Brussels, on Saturday last. Coming so quickly after the Paris show there are not many novelties on view, but the exhibition is by far the most important that has so far been held in the country and reflects the increasing importance of the industry in Belgium. Among the home concerns exhibiting cars are the Metallurgique, Pipe, Nagant, Vivinus, F. N., R. S. B. (Rochet-Schneider Belge), Dasse, Fondu, Germain, Linon, Minerva, Imperia, Saventhem, Royal Star, La Fleche, Excelsior and the Auto Mixte. Several of these firms are showing six-cylinder vehicles, among them being the Germain, an illustration of which has already been given in the *M.C.J.* The Metallurgique Co., in addition to touring vehicles, have on view a 12-h.p. delivery van, a 3-ton lorry, and a motor tower wagon for use in connection with the maintenance of the overhead conductors of electric tramways. French makers are well to the fore, among the types exhibited, either directly or through the Belgian agents, being the Berliet, Bolide, Brasier, Clement-Bayard, Delaunay-Belleville, Darracq,

has hitherto prevailed, the power of the cars will be restricted by the new rule which provides that the allowance of petrol shall be equal to 30 litres per 100 kilometres, or 9.47 miles to the gallon. No sooner did the authorisation of the race become known than the entries began to be sent in, among the first being three Clement-Bayards, three Darracqs, three Motoblocs, and a Corre. The Sporting Commission is now engaged in searching for a suitable circuit on which to hold the race, of which quite a number have been suggested. Perhaps the most important event of the week is, however, the decision of the Sporting Commission of the A.C.F. to organise a second race for cars which shall have a petrol allowance of only 15 litres per 100 kilometres—equal to just under 19 miles per gallon. The proposed distance of the new contest, which, as will be seen, is very closely on the lines of the British Tourist Trophy race, is 500 kilometres, over the course selected for the Grand Prix, and it is suggested that it shall be held next June, on the day preceding the latter event, providing, of course, that the necessary authorisation from the Government can be obtained. Each maker will be allowed to enter three cars for the event, which will be known as the Coupe de la Commission Sportive. Entries at £140 per vehicle will be received at the A.C.F. up to February 1st. Seeing that the fuel consumption limit fixed will allow cars

General View of the Brussels Salon.

De Dion, De Dietrich, Delahaye, Delage, Gobron, Hurtu, Mors, Panhard, Prima, Radia, Renault, Rochet-Schneider, Stella, Werner, and Weyer and Richmond. The Mercedes and N.A.G. cars represent the German motor industry; the Fiat, Itala, Isotta-Fraschini, and Hisa that of Italy; the Humber Company that of England; the Martini that of Switzerland; and the Ford that of the United States. Around the sides of the large hall is a big display of motor accessories, including tyres and non-skids. The show will remain open until the 27th inst.

### Forthcoming Automobile Races in France.

The past week has been an eventful one in the French automobile world, several important matters affecting future races and trials having been decided upon. In the first place, the rumours which gained ground about the time of the *Salon*, that the Government would not allow any more racing, have been proved unfounded by the fact that the proposed new rules under which the 1907 Grand Prix should be run have been considered by M. Clémenceau, the Minister of the Interior, as a result of which he has given the Automobile Club of France the necessary authorisation to hold the event. The race will be run on a closed circuit, and instead of the 1,000 kilog. weight limit, which

up to about 40-h.p. to be entered, the race promises to be a very popular one. In order, however, that the risk of accident shall not be increased by having too many cars on the road, the Committee has wisely decided to reserve the right to reduce the number of vehicles which each manufacturer may enter.

### More Trials in France.

Passing from races to trials, we have to record that at the meeting of the Competitions Committee of the A.C.F. last week the idea of organising a trial of touring cars from Paris to Madrid this year was abandoned. In its place it is proposed to hold two other trials in May next—one for industrial vehicles, and the other for light cars of about 12-h.p., both to be run over a minimum distance of 4,000 kilometres. It is suggested that the commercial car contest should be held in the northern and eastern environs of Paris, and the daily distance to be covered from 150 to 200 kilometres. The light car trial is intended as a means of developing motor-cars suitable for the use of doctors, travellers, and for similar professional and commercial requirements; the competing vehicles will cover the same course as the industrial machines, but the daily distance will be greater and an average speed of 30 kilometres per hour required.

### Some Useful Competitions.

The Association Generale Automobile, of Paris, a body which to some extent corresponds to the Motor Union of Great Britain and Ireland, has decided to organise four different competitions, all of which should serve a useful purpose. In the first place, it is proposed to hold a trial of apparatus to prevent cars being stolen. The second test will be of arrangements intended to permit of drivers seeing what is behind the car without having to look round. The third competition will deal with devices to enable drivers to hear sounds from the rear, while the fourth relates to apparatus designed to measure the consumption of fuel in petrol motors.

### Automobile Regulations in Sweden.

A new series of regulations with regard to motor traffic in Sweden came into operation on the 1st inst. They provide, among other things, that motor-cars can only be driven by persons over eighteen years of age; in towns and villages the maximum speed must not exceed 15 kilometres (9½ miles) per hour, and in the country 25 kilometres (15½ miles), while after dark cars must not travel at a greater speed than 10

### AUXILIARY EXHAUST PORTS.

THE importance of promptly relieving the cylinders of a high-speed internal-combustion engine of their hot gases as soon as their useful work has been accomplished is very generally recognised, and considerable attention is being paid by automobile engineers to the growing practice in America of employing an auxiliary side port exhaust in addition to the regular cam-actuated exhaust valve. Two-cycle engines have long been designed to exhaust in this manner through an opening in the cylinder wall, which is uncovered by the upper edge of the piston when at its extreme downward position on the power stroke, and now this method of exhausting the charge is being applied to four-cycle engines in order to secure increased celerity in freeing the cylinders of the burnt gases.

Air-cooled four-cycle engines have been the first to be provided with side port release, but now at least one well-known American builder of cars with water-cooled engines has adopted the method. The opening by the piston of a large annular port in the cylinder wall, extending around a fraction of the circular section of the cylinder and leading directly to the silencer by

The "Shamrock" Motor Coach, which is about to be put in service in the Dublin District. (See page 1033.)

kilometres (6½ miles). Some special rules are provided for Stockholm, owing to the numerous bridges and narrow streets.

### Vibration on Motor-Buses.

The Conseil d'Hygiene Publique de la Seine, of Paris, has been considering the question of vibration in motor-buses and its effect on the passengers, but more especially on the drivers and conductors, who, by reason of their work, are confined on the vehicles for long periods. It was stated that the vibration and shocks were mainly due to the use of wheels shod with non-continuous rubber blocks, and it has been decided that to remedy this state of affairs the suspension of the buses, more especially at the rear, must be improved by the introduction of rubber or pneumatic cushions in connection with the springs.

### Miscellaneous Items.

The exports of motor-cars from France during the eleven months ending with November last attained a value of £5,058,040, an increase of £1,353,640 over the corresponding period of 1905.—The Kaiser has just placed an order for a 45-h.p. N.A.G. car; it is to be provided with two bodies—a double phaeton for summer use and a limousine for winter service.

a special pipe of large bore, may, remarks an American contemporary, be expected to quickly reduce the terminal pressure in the cylinder at the close of the power stroke. This reduction of pressure results in a corresponding decrease of temperature of the remaining gases due to expansion, and by the time the regular exhaust valve is fairly open, the temperature of the gases may have fallen very materially below that at which they would have been had no auxiliary outlet been provided. The decrease of temperature of the gases passing the exhaust valve may, indeed, be sufficient to reduce the scaling, pitting and warping of the valve in a very noticeable degree, or perhaps to largely prevent these evidences of deterioration. Most of the heat damage to ordinary exhaust valves takes place during the first portion of their opening, when the "fire" is actually passing through them, but little deterioration being caused during the later portions of the stroke when the gases are relatively cool. By allowing the port to take the brunt of the very earliest and hottest portion of the exhaust, and timing the exhaust valve to open a little later than would otherwise be permissible, the life of the latter valve should be prolonged.

KING ALPHONSO of Spain has decided to use the Continental red rubber steel armoured non-skid tyres on his cars.

THE Riley Cycle Company, Ltd., have provided in their works at Coventry for turning out a large number of their de luxe tri-cars in the coming season.

MR. H. J. DOUGHTY, of the Granville Motor Garage, 205, Clapham Road, S.W., has issued a circular showing his terms of hire for motor-cars—a department in which he has attained considerable success.

THE Waterloo Motor Works, of Chicheley Street, Lambeth, S.E., are doing the garage work for the Junior Army and Navy Stores and also the proprietors of the "Evening News."

MESSRS. REID'S carriage works in Princes Street, Perth, have now accommodation for garaging motor-cars. The firm is also devoting attention to the construction of motor-car bodies.

THE Central Motor Garage Company, of which Messrs. A. W. Whaley and J. W. Morris are the proprietors, are letting out cars for hire from their garage in Sawley Road, Long Eaton.

EXTENSIONS are being made to the West End Cycle and Motor Engineering Works, of Dublin, in the garage of which Messrs. Eager and Dalton have been doing good business throughout the past year.

FOLLOWING the snow, the Parsons Non-Skid Company, Ltd., report that they have been overwhelmed with orders for non-skids, including an urgent command from Sandringham for four sets for H.M. the King's cars.

OPPOSITE the town clock at Shanklin Messrs. Bailey Bros. have increased their facilities for storing and repairing cars—a fact that will be of interest to motorists taking their vehicles to the Isle of Wight during the coming season.

MR. J. T. WHITEHEAD, of the Peel Park Ironworks and Garage, has a fully-equipped motor repair shop in Water Street, Accrington, where he keeps a large stock of accessories, &c. His garage will doubtless be of service to Lancashire motorists passing that way.

MR. W. V. J. TIMMS, motor-car engineer, has removed from Deodar Road to 3, High Street, Putney, S.W., where he will continue to repair motor-cars and stock accessories. A part of the premises thus converted to automobile uses were formerly occupied by a farrier.

AMONG the reminders of the New Year with which we have been favoured is the handy pocket-book published by the Continental Tyre and Rubber Company, which not only reminds its owner of the good points of the Continental tyres, but has the advantage of being of real service.

WHEN *en route* to Nottingham the other day we noticed that the A.C.G.B.I. caution-board, on the northern side of the village of Brixworth, Northamptonshire, had fallen down. Great care must be taken by motorists on approaching the place from either side. It lies in a hollow, and the main street is not only extremely narrow but comprises a couple of nasty turns.

A NEW garage, fully equipped with machinery and tools and manned by skilled mechanics, has been established on the main Coventry and Birmingham road by Mr. A. Burgess. This is located at Hay Mills, Birmingham, and Mr. Burgess, who has had a decade of practical experience in the motor trade, will stock accessories and execute all kinds of repairs to troubled cars.

THE new West End depot of Humber, Ltd., at 60-64, Brompton Road, London, S.W., is one of the handsomest of the modern motor depots which are now adding to the attractiveness of that part of London. The showroom has an area of about 3,000 square feet, where ten cars can be shown to advantage without over-crowding, and there is ample opportunity for investigating every part of any one of the famous models.

THE Reigate County Bench is reported to have granted a summons for assault against Inspector Jarrett, at the instance of Mr. W. G. Roberts, of Westminster Bridge Road, S.W. Mr. Roberts was one of three defendants summoned by Inspector Jarrett at the November sitting of the court, but after a lengthy hearing the summonses were dismissed. It is alleged that the inspector, after stopping Mr. Roberts, used threatening expressions, and twice thrust his fist into his face.

## HERE AND THERE.

NOTTINGHAM is a place near Beeston, is the way Mr. T. C. Pullinger, of the Humber Company, now describes the lace-manufacturing city!

A MOTORIST, fretting to himself, recently expressed this sentiment:—"I don't care whether I get a crankless automobile, or a joltless spring and a heatless motor, if I can only find a fineless chauffeur!"

THE Hon. Arthur Stanley, the Chairman of the A.C.G.B.I., left London for Egypt early this week.

MR. J. GIBSON, of 36, Lower Beechwood Avenue, Ranelagh, Dublin, is about to open an automobile depot in the Irish capital.

THE Orient-Royal Mail Line have made arrangements whereby motorists can take their cars at special rates to Marseilles or Naples.

WE illustrate herewith a new motor chain-cleaning and lubricating brush, which has been recently patented by Mr. H. Copeland, and which is about to be put on the market by the Motor Chain-cleaning and Lubricating Company, of Plantation Street, Accrington. The idea consists essentially in an adjustable bracket, a freely-rotatable brush carried by the same, and a piston or other suitable lubricator for supplying lubricants to the chain. The bracket A, which can be attached to any suitable

part of the car, is made in two parts, so as to be easily adjusted, the adjustment being carried out through the agency of one or more bolts D. The bracket is provided with a spindle C, upon which is mounted the rotating brush B, which is of suitable diameter and wider than the chain. Arranged above the latter is a piston lubricator F screwed to the bracket A. As will be seen, the outlet of the lubricator is extended so as to form a tube of the same width as the brush. The latter is adapted to come into contact with the chain so as to be rotated thereby, and, as it does so, dirt is removed from the chain and lubricant is transferred to it, so keeping the chain in good running condition.

ONE of the attractions of the motor show at Dublin last week was the "Shamrock" petrol motor coach, which is about to be put in service by the Motor Bus and Traction Company. The vehicle, of which an illustration is given on page 1032, is of the Lacoste and Battmann type, and was supplied by the Standard Steam Lorry and Omnibus Company, Ltd., of Rayleigh, Essex. As will be seen, it is of the single-deck type, with open front seats for smokers and enclosed rear, there being accommodation for twenty-two passengers and a driver and conductor. A service of these vehicles is contemplated between Dublin and Swords, Dublin and Bray, and Dublin and Lucan, as well as on several of the tourist routes.]

A WELL-EQUIPPED garage has been opened in Mill Street, Oakham, by Mr. J. E. Baines.

THE Cleveland Motor Company have established a garage in the Grange Road, Darlington.

LORD GRENFELL and Sir Wm. Goff were among the purchasers of Ford Junior cars at the Dublin Show.

A MOTOR-CAR is now on its way to Southern Nigeria, to the order of Sir Walter Egerton, the High Commissioner.

THE motor-car show at Bingley Hall, Birmingham, opens on the 18th, and will not close until Saturday, the 26th inst.

NEW members of the A.C.G.B.I. include the Duke of Rutland, Sir Gorell Barnes, Mr. C. B. Balfour, M.P., and Major-General W. F. Vetch.

MESSRS. R. REYNOLD JACKSON AND CO. have supplied a 30-h.p. single-deck motor-bus to the Woolton Motor Omnibus Company for service in Liverpool.

THE Harrogate Corporation is ascertaining from the local authorities adjoining the town their views with regard to the share of the cost each would bear in providing the district with a motor fire engine.

A NEW competition is likely to be set afoot by the A.C.G.B.I. in which each competing car will be allowed two gallons of petrol, the vehicle travelling the farthest on this allowance on a circular route to receive the prize.

The 30-h.p. Jackson Single-Deck Motor-Bus recently supplied by Messrs. R. Reynold Jackson and Co., Ltd., to the Woolton Motor Omnibus Company, Ltd., for service in Liverpool.

LADIES are among the ardent students at the Argyll School of Motoring in Newman Street, London, W., where there is also a ladies' waiting room for the convenience of ladies visiting the Argyll headquarters in town.

A SPECIAL sale of new and second-hand cars, as well as accessories, is now taking place at Automobilia, Ltd., nearly opposite the Marble Arch, in Oxford Street, London. This is to clear the way for the spring stocks.

MESSRS. DUCROS MERCEDES, LTD., ask us to mention that they have received a letter from Mr. C. L. Charley, stating that the Mercedes electric and "Mercedes" Mixte cars have no connection with the Mercedes petrol cars manufactured in Cannstatt and Unterturkheim.

THE Highways Committee of the Essex County Council has generally approved of the proposals of the Royal Commission on Motor Cars, but would seek to give powers to County Councils to establish a speed limit of twelve miles per hour in districts in the county under their administration.

DURING his recent trip to the Tropics, President Roosevelt took advantage of the ownership of a White steam car by one of the Government officials in Puerto Rico to drive the vehicle in the surrounding country. It is said that he found more interest in the management of the machine than in the scenery.

COUNT JOSEPH POTOCKI, of Vienna, has ordered an Itala six-cylinder car.

IN the Southern India reliability trials the first three cars to arrive were fitted with Continental tyres.

MESSRS. S. F. EDGE, LTD., send us a list of no less than 103 different firms in various parts of the world who are now building six-cylinder cars.

A NEW law has just come into force in the State of Iowa, U.S.A., which requires that all cans used in connection with petrol be painted a bright red colour.

THE L.C.C. is to be congratulated on its improved form of driving licence, which is now, at least, of a more convenient shape than was the case in the early part of 1906.

THE number of motor-car licences, which includes motor-bicycles, issued in the county of Stirling last year was 225. Over 300 licences were issued to drivers.

MR. T. MCKINNON WOOD, M.P., the leader of the Progressives on the L.C.C., has taken a house at Crowborough, and journeys to and from town on his 30-40-h.p. Daimler car.

A BRISTOL athlete has been attaining newspaper distinction by pitting himself against two 8-h.p. motor-cars, by sheer strength holding them when started at full speed in opposite directions.

A MOTOR-BOAT for the Victorian Mission to Seamen has been launched from the yard of Mr. Blunt, Geelong, Victoria. It is fitted with a 16-h.p. motor and will be employed to enable chaplains of the mission to board vessels in Hobson's Bay.

MESSRS. DENNIS BROS., LTD., have sent us a photograph showing the three new mail vans they have just delivered to Mr. Wright, of Dereham, the contractor for the carriage of mails in Norwich, Dereham, and Fakenham. The vehicles are fitted with 14-16-h.p. engines and worm-gear drive.

CHASED by the Berks and Bucks Stagounds, a deer which had been run from Easthampstead Park dashed along the central street of Wokingham in an exhausted condition. The terrified creature bolted into a garage and ran through several workshops, finally seeking shelter in the furthestmost.

MESSRS. CHARLES JARROTT AND LETTS, LTD., inform us that the engines of the 1907 De Dietrich car are all constructed so that they may be fitted with the Letsmob self-starting apparatus, but, of course, at an extra charge. A description of the arrangement, together with an illustration, appears elsewhere in the present issue.

FROM the Britannia Engineering Company, Ltd., Colchester, we have received a photo of a 55-ft. cruising motor-launch they have lately completed for Sir Thomas Lipton. The vessel is provided with two Britannia 45-h.p. six-cylinder engines, each driving its own screw, which enables an average speed of thirteen knots to be attained on a long run under ordinary conditions.

IN addition to the Winton car referred to in our last issue, Messrs. Turner Bros. had on view at the Dublin Show two of the well-known Star cars of the Star Engineering Company—a 7-9-h.p. two-cylinder vehicle, and a 10-h.p. four-cylinder. The latter is a new model, with cardan shaft transmission, although it is also made with side-chain drive. The moderate price of the Star cars has brought them into considerable favour in Ireland.

ALTHOUGH the mildness of the winter has made many motorists somewhat negligent in the matter of heating their motor-houses, they should not leave the subject wholly unconsidered—a reflection that occurs to us after perusing the admirable booklet issued by Messrs. Jones and Attwood, of Stourbridge, in which they give most potential reasons for preparation against frost and cold in the motor-house. Their "All Night" and Ascot boilers are specially designed for this purpose, and can be banked up to last fifteen hours without attention. The boiler itself can stand in an adjoining compartment, the pipes passing through the wall into the motor-house, there being thus no fear of fire from the apparatus. The experience of Messrs. Jones and Attwood in this class of work is at the disposal of motorists curious as to the cost of such apparatus, and intending inquirers should obtain a copy of the booklet referred to.

## EAST ANGLIAN CONTRASTS.

OUR two pictures—one representing a typical scene on a Suffolk highroad a century ago, and the other its modern prototype in the horsey town of Newmarket—show the contrast that has sprung up between old and new methods of locomotion. There is no need to linger on the subject; it is apparent to all who travel. Lovers of the picturesque may lament the fact, but the evolution is satisfactory from the sanitary point of view. The journey from the low-ceilinged inn, the odorous stable-yard, and all their associations, to the newer hotel side by side with the well-ordered garage, is along the line of improvement. There may be a want of the disorderly groups of men and things that some associate with the glories of the countryside; but there is something that saves time, temper, and worry in the modern methods of travel. All these are known to travellers, and receive their due meed of appreciation from the Order of those who Motor. Even Mr. Tom Browne, R.I., the well-known artist, who tells us that he does not motor now—after thanking heaven that he sold the only car he ever possessed—declares that “motor cars are fine things, if they belong to someone else.” There must be an absence of covetousness in the man who would make such a confession.

Mr. Rudyard Kipling goes even further, and declares that “a day in a motor-car in an English county is a day in some fairy museum where all the exhibits are alive and real.” There are many such “museums” in our land; one has been suggested by Messrs. Botwood and Egerton, of Ipswich, by whose favour we give the illustrations accompanying this reference. They suggest that the most picturesque parts of Suffolk are easily accessible to the motorist who makes their town the centre for his explorations. There is much to be said in support of this special pleading. The headquarters of the A.C.G.B.I. and of the Eastern Counties A.C. at Ipswich is the Great White Horse Hotel—the identical “hostelry in the main street, on the left-hand side of the way,” where Mr. Pickwick encountered the middle-aged lady in curl papers, to their mutual consternation. Ipswich is full of memories—recalled by the Elizabethan mansion in Christchurch Park, and Wolsey's Gate. Southward from Ipswich, through the woody lanes of East Bergholt, is Stratford and the Dedham valley, with Flatford and the villages immortalised in the pictures of Constable. In an easterly direction, by way of Woodbridge and Staverton Park (an untouched

In the Olden Days.

deer forest since the time of Henry VIII.), Orford is reached, with its grand Norman castle, and Framlingham, with its more extensive castle, is not far afield. Taking the coast line again, the old-world town of Aldeburgh is reached, whence a delightful spin across some miles of heath-land leads to all that is left of Dunwich, and away again north the ruins of Walberswick, and through sunny Southwold to the modern and rapidly-developing seaport of Lowestoft.

From thence, inland, Messrs. Botwood and Egerton suggest a run through the valley of the Waveney, by Bungay, with its remains of Bigod's old castle, by Harleston, Mendlesham and Debenham, and a score of other villages, deep hidden in rural surroundings peculiar to the county, through Stowmarket to Bury St. Edmunds, one of the richest relics of mediæval times. To the archæologist this place is of surpassing interest, its noble Norman tower, its Abbey ruins and grounds, its fine churches,

Newmarket—The Present Day.

and the old world stillness pervading its streets, seem to carry the visitor back for centuries. In the tide of progress Bury has been left behind, but therein lies its charm.

Not far from Bury, too, lie the quaint towns of Long Melford and Lavenham, containing the two finest churches in Suffolk, and the latter town some fine specimens of timbered houses and the ancient Guildhall familiar in many a picture. Sudbury and Clare, with its castle, are on the borders of the county, and then a glorious run over a great stretch of heath-land, and Newmarket, the great racing centre, is reached. Directly north lies the almost forgotten town of Mildenhall, nigh to the borders of the Fen country, and the Brandon Flats, with their flint mines, the oldest in the world, whence prehistoric man obtained the material for his first stone axes and arrow heads.

In so short a space it is impossible to more than indicate a few odd and out of the way places where the motorist may find scenery to charm the eye, and historical associations of the deepest interest. The roads throughout most of the county are good, and though here and there are a few hills which require careful negotiation, the country as a whole is flat. It is, however, richly wooded, and those who appreciate pure rural scenery, with its quiet repose, will find it has few equals.

FIAT MOTORS, LTD., have now received one of their latest design of double-deck motor-buses, in which the engine is not under the front seat but under a bonnet in the usual way.

WE learn that the Duke of Richmond and Gordon and Lord Hastings have both ordered 30-h.p. Daimler chassis, this being the former's second vehicle from the Daimler works at Coventry.

It has recently been announced that the Daimler Company are producing a small car, and many people thought that meant a new type would be turned out at Coventry; this, however, is not so, as these new cars will be of Italian construction and made by the Societa Officine De Luca-Daimler, whose works are still in the course of preparation in Naples.

MR. T. SPONG, who is well known in connection with the motor tyre business, is now extending his interests in automobilism, and is opening a large motor garage in the High Street, Shaftesbury Avenue, W.C., where he has three inspection pits, and excellent facilities for carrying a large stock of spare parts, &c. The garage will be a great convenience to motorists in the West End, and should be much appreciated by theatre-goers.

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

#### FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—After many months of argument, discussion and correspondence as to the relative efficiency of a four-cylinder and a six-cylinder engine, we at last have in print the admission of a manufacturer of six-cylinder cars that a six-cylinder engine is not as efficient as a four. Mr. F. H. Royce in his letter uses these words:—"The loss of efficiency by the employment of six cylinders instead of four." I congratulate Mr. Royce on giving his candid opinion, an opinion which I feel sure is based upon experiments in his shop. Mr. Royce is the first manufacturer of this particular type of engine who has had the courage to tell the truth. We have been informed month by month, week by week, and day by day, that the six-cylinder engine was more efficient than the four. But now we have the authority of Mr. Royce that a six-cylinder engine is less efficient than a four. Of course, all those who have studied the

"It's never too late to learn." An aged cab-driver at the wheel of an Argyll Motor-Cab. Reproduced from a photo taken at the Argyll School of Motoring in London.

question at all, or who have an elementary knowledge of the question, have been aware that theoretically six cylinders were worse than four, but what has the self-styled introducer to say to Mr. Royce's assurance that in practice it is less efficient than four? Mr. Royce has abstained from all these arguments in the past, and I am pleased to see that the first letter written by him is such a straightforward one, and I am equally somewhat flattered that the arguments I have raised for so many months with the object of trying to prevent the technically ignorant public from paying abnormal sums for an inefficient engine are backed up by so good an authority as Mr. Royce.

We have therefore the list comprising the undermentioned names of the men who have stated that the six-cylinder engine is inefficient:—Mons. Turcat, of Dietrich fame, Commandant Krebs, of Panhard and Levasseur, Herr Maybach, of the Mercedes Company, and several other well-known men, and, finally, we have a well-known British engineer, Mr. Royce, to follow suit.

There is only one thing that I cannot agree with Mr. Royce in, and that is, that a six-cylinder engine has less vibration than, or less noise than, or is more quickly able to pick up than a four-cylinder motor. Surely where practice has proved sound theory to be correct in one case, it must prove to be so in the second. The more efficient the engine is the more quickly it should pick up the load; the more efficient the engine, the less noisy it can be made, and the more efficient the engine, the less vibration it should have. I am sure Mr. Royce will agree with me

in theory. Is it so in practice? I would invite Mr. Royce to take a short run on a "Weigel" car, and I shall be most happy to be his driver and place myself entirely at his disposal, and he can give me any test he likes, and I believe I will convince him that the four-cylinder car bearing my name has less vibration standing still than any six-cylinder engine he can name, and that it will pick up quicker than any six-cylinder that he knows of, and that it is as noiseless as any six-cylinder car he has driven on. I promise Mr. Royce it will not be a "faked" car, and I am prepared to accept from him such tests as will prove that the four-cylinder car that I will drive him on is not a "faked" one. I will undertake that it is fitted with an ordinary touring body and that it shall attain a speed of sixty miles per hour upon the flat, that it will take Hand Cross on top speed, and will be driven on top speed without the use of clutch or brake, at a speed of less than five miles per hour.

After having read Mr. Royce's letter, I feel sure it is not his desire to foist upon the public six-cylinder engines, if he comes to the conclusion that four-cylinders are better. I am quite certain after his straightforward letter that he is prepared to advise the public in accordance with his true belief, and therefore I trust that he will see his way clear to accept my invitation, which is not tendered in the form of a challenge or a boastful suggestion as to the merits of the "Weigel" chassis, but purely an offer as from one manufacturer to another to try and prove a point, or, failing that, to be taught one, and not only in my own interests or in the interests of Mr. Royce, but in the interests of the motoring public who are our respective patrons.—Yours truly,

D. M. WEIGEL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You will no doubt be pleased to hear that the £1,000 challenge issued some time back by Mr. S. F. Edge to the builder of any four-cylinder car which will equal the six-cylinder Napier car is at last to be taken up. My company (the Motor Engine and Manufacturing Co., Ltd.), are now prepared to match their four-cylinder car, fitted with their Duplex engine, against his six-cylinder, upon the conditions that the total capacity of the four cylinders of our engine are to be equal to the total capacity of the six cylinders of the Napier engine, and that the ratio between the engines and the road wheels on both cars are to be the same.

If this match is arranged, I take it that the points upon which the cars will be judged would be as follows:—Speed in hill-climbing, economy in fuel consumption, absence of vibration, continuity of torque, silence, simplicity of construction and control, flexibility, i.e., variation obtainable in engine speed, and perfect combustion.

My company, in accepting Mr. Edge's challenge, contend that a four-cylinder two-stroke air scavenging engine of the Duplex type, with its absence of valve mechanism, secondary shafts, and gear wheels, is superior to any six-cylinder four-stroke engine having the same cylinder capacity, especially when it is remembered that the latter has nearly one hundred working parts as compared with the Duplex, which has only three working parts per cylinder, viz. piston, connecting rod, and crank, and which is not subject to the disadvantages of the Napier or other types of engines, with their multiplicity of parts, now in general use. The derangement of any one of the many parts of a six-cylinder four-stroke engine (even if it be but a key or a cotter becoming loose) often means a stoppage of the engine.

I therefore hope that Mr. Edge is ready to match his car against ours, the result to be left in the hands of two well-known experts acting as judges, who would be mutually agreed to between us.—Yours truly,  
THOS. D. KELLY.

#### THE TOURIST TROPHY RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Probably every thinking motorist will admit that the basis on which the Tourist Trophy is run, i.e., fuel consumption, is the best test of efficiency of contesting cars, but it cannot be overlooked that buyers of touring cars at the present day place far less importance on the fact of one car being slightly faster or slightly better in petrol consumption than the other than they do on the fact that one car is more silent and free from vibration than another. It appears to me, therefore, that the Automobile Club would be wise not to overlook this fact.

It is conceivable that a one-cylinder car might win the race for the Tourist Trophy, but a one-cylinder car giving between 20 and 30-h.p. would not be an article which would be purchased by the public, and such a freak car might be discouraged by requiring it to cover the distance on a smaller quantity of petrol than was allowed, for instance, to the smoother running four-cylinder car. In the same way no unprejudiced motorist would deny that the six-cylinder car is superior as regards silence and absence of vibration to the four-cylinder car, and its superiority as a touring car might well be recognised by the Club by allowing a greater quantity of fuel for the six-cylinder car than for the four-cylinder car in the race for the trophy. The loss of efficiency by the employment of six cylinders instead of four is so far outweighed by the consequent gain in silence and absence of vibration, that the Club would be short-sighted in overlooking the point in preparing regulations in a race which is to settle which is the best touring vehicle. Mr. Beaumont could, without doubt, calculate what would be the relative amounts of fuel allowed respectively to cars having one

cylinder, two cylinders, three cylinders, four cylinders, and six cylinders.

Unless some recognition is made by the Club in their rules of the fact that absence of vibration and silence are of vital importance, they will, in my opinion, not be encouraging the best form of motor, but will be encouraging a type which, although efficient, may not satisfy two of the principal requirements of the ordinary purchaser.—Yours truly  
F. H. ROYCE.

### THE "BROOKLANDS" RACING TRACK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. F. M. Young's letter appearing in your issue of January 12th, from his remarks he is evidently under the impression that I was responsible for the design of the "Napier" car, but this is incorrect. I did, however, carry out various improvements on the racing cars, and also carried into practice, and tested, improvements at different times which were originally introduced by Messrs. Napier's designers.

No doubt it would be very interesting, though very unsportsmanlike, for me to compete against Mr. Edge on his "Napier" car, owing to my having had an extensive experience in testing and driving his cars; and obviously, therefore, knowing all the virtues and good points of the "Napier," they are naturally embodied in my new production, with their attendant drawbacks, if any, carefully eliminated.

It is only necessary to study the "Thames" car for a few minutes in order to see where it differs from the "Napier"; but as Mr. Edge is not running in the present case on lines by which the public can judge the merits of his car, he having merely to carry out a programme which he has arranged to suit the particular car he is running, it would appear pretty obvious that he does not consider himself able to distinguish himself against me, as otherwise he might have directed his challenge in such a way that I should have been bound to accept.—Yours truly,

W. CLIFFORD-EARP.

### WANTED—A RED MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My favourite dog, a valuable bull-terrier, was killed about 3.45 p.m., December 21st, by a motor-car going west along the London road between Bagshot and Camberley.

The car, which was travelling so fast that bystanders were unable to read its number, hit the dog with a thud which was heard thirty yards away. The poor beast was practically disembowelled, and died in agony three or four minutes later. One of the occupants of the car stood up and looked back, but the car proceeded on its way without slackening speed. The car was a red one with a Cape cart hood; it was carrying two people, and its number is believed to begin with L.C. I trust, Sir, that you will give publicity to these facts, in the hope that some of your readers may be able to identify the car and send information to me at Pinewood, Bagshot. This should not be very difficult, as our motoring public cannot surely include many such inhuman wretches as the two cowards who occupied the red motor-car. I appeal to you, Sir, not so much on my own behalf, although I am distressed beyond words at the sudden loss of a faithful and gallant companion, as on behalf of my fellow-citizens who love their canine friends.—Yours truly,  
N. COWIE, Captain.

### SUBSTITUTES FOR THE HORN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having had a year's experience of the value of a foot gong upon a former car, and having on my present car no foot to spare, I have just fitted successfully an electric bell rung by a switch moved by a left hand finger. The gong is about six inches in diameter, and there are two connected batteries of four volts each. The sound can, at will, be small or great, short or long. If necessary, it can be heard a quarter of a mile away. At the same time it is musical, and neither exasperating nor monotonous.—Yours truly,

LEVESON SCARTH.

### PRE-IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the very interesting article on pre-ignition which appeared in your issue of December 29th last the writer states that "if the gas is too rare, it not only fails to produce power, but pops back into the inlet pipe and carburettor." I know one expert who contends that popping, due to a weak mixture, occurs in the exhaust pipe and not in the carburettor. Professor Spooner, in "Motors and Motoring," also holds that "the charge is not exploded in the cylinder, but passes out of the exhaust valve into the silencer." Personally, I disagree with them, though I do not pretend to be an expert, for, when riding a motor-bicycle at night, I have distinctly seen flame coming from the extra air inlet of the carburettor (a Longuemare) when it was opened too wide; when slightly closed the popping ceased and the engine fired perfectly, which proves that the popping was due to too weak a mixture.

I can understand that a weak inlet valve spring or pre-ignition might cause popping in the carburettor, but unless it is that when the

mixture is weak the explosion is so scattered that part of the charge is firing at the beginning of the next induction stroke, I cannot see how it is caused, and should be glad if some of your readers could enlighten me on the subject.—Yours truly,

E. T. W.

### WANTED, A PARAFFIN CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "Motorist's" letter in the correspondence columns of the *M.C.J.* of January 5th, asking for information about paraffin carburettors, has he tried the B.W.? A friend of mine has one of these fitted to his 10-12-h.p. two-cylinder car and finds it thoroughly satisfactory. He uses paraffin, which he is paying under 4d. per gallon for, and starts his engine with a few turns of the handle quite readily, without the use of petrol or previous heating of the carburettor. Combustion is apparently complete, as there is no clogging of the cylinders or valves with deposit and the exhaust is invisible and as odourless as if petrol were used. As regards cost, I believe the 8 to 10-h.p. size costs £7; the fitting is easy and should not be an expensive matter.—Yours truly,

SATISFIED.

### NON-SKID EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In regard to the letter in the *M.C.J.*, of the 29th ult. with reference to the fixing of non-skids, "Hillrosea" is decidedly wrong when he infers that it is better to have only one non-skid on the back wheels of a live axle car. The difference in the diameter of a non-skid and a plain treaded tyre is considerable, and the use of only one non-skid

One of the two identical cars which the Daimler Company are supplying to H.M. India Office. The vehicles are of 28-h.p. with 9 ft. wheelbase, and are fitted with the Kenilworth type of body.

means continual wear on the differential, which must be harmful to it. I hardly see why it is necessary to provide for the tyres slipping on the road at starting; an ordinary pair of plain tyres should not slip on a dry road if the clutch is allowed to engage gently.—Yours truly,

E. T. WRIGHT.

### RENOVATING CELLULOID WINDOWS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The celluloid windows on the side curtains of my Cape cart hood, as well as the celluloid front, have been cut and scratched and generally blurred by the action of sand and dust rubbing on the celluloid. I should be obliged if you or any reader of the *M.C.J.* could tell me of any preparation that will remove such blemishes from the windows.—Yours truly,

A. PRESTON.

[It is difficult to prevent celluloid from becoming scratched with use, and the only suggestion possible for restoring its surface somewhat is to carefully varnish it, after cleaning, with a thin solution of celluloid in acetone. It is, however, a fairly cheap material, a sheet 1-50 in. thick, about 2 ft. by 4 ft., costing about five shillings, so it would be less trouble to replace with a fresh piece.]

### PAYMENT FOR REFERENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For three years past, up to November, I had been in the employ of a professional man in South London. In November I gave him a week's notice, when I was promised a reference. The reference was applied for recently, and on not receiving an answer I wrote. This is part of reply:—"Why should I bother myself with giving a reference? As you said once you were within your rights (that referred to only

giving a week's notice) so shall I be when asking a fee for same. Why doctors should work for nothing I can't see at all." And this was the reply I received after having run his car and kept it in perfect condition for three years, during which time it was used on an average 320 days a year. So much for a doctor's place; no wonder drivers fight shy of them.

—Yours truly,

C. FOORD.

### A QUESTION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sorry that Mr. Hickman considers my suggestion that many accidents have been caused by nerve failure to be foolish. Perhaps it is; but one has only to read the newspapers to note many cases of sudden collapse of seemingly strong and healthy people, and I fail to observe why motor drivers should be in any way different to ordinary beings. Of course people can spend their money as they choose, but not to make themselves a nuisance and danger to others. If the legal limit were fifty miles per hour, many drivers would not be satisfied, and it is only the weight limit that prevents some ambitious motorists from driving a G.N.R. locomotive along the highways.—Yours truly,

A 1299.

### LAMPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There must be many of your readers who require their cars for short periods after dark, and who dislike the trouble of lighting oil lamps. The Osram lamps are excellent. They give a brilliant white light, and the 4-volt lamps take only 3 amperes, which is very economical as compared with the old carbon filament lamps giving the same candle power. What is more, I find that I can run a 4-volt and a 2-volt lamp in series off an ordinary 4-volt ignition cell, the 4-volt lamp being in my rear lamp and the 2-volt on my dashboard. The light of the 4-volt lamp is not

Frightened Passenger: "Do be careful, we are approaching a village."  
Driver: "Don't you worry, I never go through a village at more than fifty an hour."  
L'Omnia.

appreciably diminished whereas the 2-volt only glows a bright red, and this is exactly what one requires, as the latter is sufficient to indicate that the former is alight without distracting one's attention whilst driving.—Yours truly,

G. WASHINGTON ISAAC, M.B.

### INSURANCE CLAIMS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a motor-car insured against accidents up to £250. I had the misfortune to collide with a tramcar. My motor was considerably damaged, the large tool box on the step was smashed to splinters and the tools distributed all over the road. In the dark some of these were lost and others were picked up and kept as souvenirs by the crowd. I have put in a claim for the lost tools, being part of the car, but the insurance company are wishing to argue that the tools are not covered. I can only say that a complete kit of tools and a tyre repair outfit is included in the price of the chassis.

It is one of those irritating points which will cause all motorists to welcome the insurance scheme of the Motor Union. The idea, surely, in insuring one's car against accidents is to cover oneself against loss.—Yours truly,

C. D. L.

### LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 12-h.p. two-cylinder Darracq which has run about 5,000 miles without any trouble. Lately there has been a great want of power. I have to take all hills on second speed. I find there is very little working power in one of the cylinders when the engine is running in the stable; in fact, there is not power enough to keep the engine going if I cut out the other cylinder; it also misfires at times. The compression

is very good. I have tried new plugs, new platinum screws and springs. I have opened and closed the points at the plug, also at the make and break, but with no improvement. There is a good spark and a sharp click if the wire is detached and held near any part of the engine or plug. Do you think the trouble is caused by the cylinder being sooty? Perhaps you or some of your readers may be able to help me.—Yours truly,

X. X.

[We are inclined to think that our correspondent's trouble is due to carburation, this not being of the same proportion in each cylinder. We would advise trying each cylinder independently, varying the mixture to suit each, thereby determining if this be the case. If one were found to require more air than the other a small hole might be drilled in the inlet pipe close to the cylinders, to admit an extra supply to that cylinder. If the latter have not been cleaned lately, perhaps a better result would be obtained if this were done.]

### THE STEERING GEAR OF THE 10-14-H.P. CLEMENT BAYARD CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent "D," M. A. Clement has designed the 10-14-h.p. car specially for cab service. It is made with both right and left hand steering in order to suit either Continental or British driving practice.

May I say that Clement-Talbot, Ltd., are the owners of M. A. Clement's British patents, and are also his sole agents for Great Britain and Ireland?—Yours truly,

T. H. WOOLLEN.

### A PETROL MOTOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have often read that, owing to the heat to which they are subjected, exhaust valves and their springs are liable to breakage. I have not experienced this trouble as yet, but I should like to be prepared, and am anxious to know how I can determine the existence of a broken exhaust valve spring without exactly seeing it. If you, or any reader of the *M.C.J.*, can assist me in the matter, I shall be obliged.—Yours truly,

R. SALKELD.

[With reference to a broken exhaust valve spring, our correspondent may rest assured that it would not require a deal of finding, as naturally the cylinder containing the broken valve spring would cease to work, owing to the valve offering no resistance to the suction of the piston; it would be taking in a portion of the exhaust gases, and in all probability cause a loss of compression. A broken exhaust valve is, however, not a very frequent occurrence, unless materially weak.]

### HEAVY PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 10 to 12-h.p. car with two-cylinder motor 100 mm. bore by 120 mm. stroke, weight about 14 cwt. The only complaint I have to find with the vehicle is its large petrol consumption, viz., fifteen miles per gallon, "Shell" or "Pratt's." The car is fitted with ball bearings throughout (except engine), cardan shaft and live axle and all are in good order. The pistons and valves are all tight, but I think it is too large in compression space. When fitted with a steam gauge the compression registers about 35 lb. per sq. in. What I want to know is, should I get a better mileage per gallon by reducing the compression space, and, if so, how much?—Yours truly,

CONSTANT READER.

[The compression of "Constant Reader's" engine is without doubt much too low for economical running. This might be raised to 60 lb., if possible, when the consumption should be considerably reduced. If the compression space is in the cylinder itself, we would advise the fitting of longer pistons, as a block generally retains so much heat and causes overheating.]

### THE USE OF AIR VENTS ON ENGINE CRANK CASES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or some reader of the *M.C.J.* could give me an explanation of the purpose of air vents so generally applied to the crank cases of automobile engines. I am told that they are in some manner necessitated because of the pumping action of the underside of the piston, and can see how this would be so in the case of a single-cylinder engine, a double-cylinder motor with both connecting rods on opposite cranks, or with any analogous construction. But I do not see why they are applied to four-cylinder vertical motors, in which the displacement of the two downwardly-moving pistons is compensated for by the other two going up.—Yours truly,

H. PAULTON.

[We think our correspondent will find that on a great many of the new engines, where the displacement is equalised, that no air vents are now fitted, although they are in this case not absolutely essential. There is always the possibility of a leakage by the piston taking place, thereby giving rise to pressure in the crank case, when, of course, an air vent would be of service.]

## THE TOURIST TROPHY RACE.

SUPPLEMENTING the information with regard to the specifications of chassis, &c., for the cars permissible in the International Tourist Trophy Race, published in our issue of the 29th ult., we now give the minimum dimensions of body, fuel tanks, &c.

The car shall conform in all respects to the requirements of the British law. The chassis shall have not less than four road wheels, of which the driving wheels shall not be less than 32 in. in diameter. The track shall not be less than 4 ft. 6 in. The distance from the dashboard to the front edge of the back tyres shall not be less than 5 ft. 3 in. The platform behind the dashboard shall not be less than 7 in. 6 in. long, and the body shall cover this area. There shall be a clearance of at least 8 in. from the ground when the car is fully loaded. All steps, brackets, and other fittings shall be of requisite strength.

Fig. 1.

Figs. 1 and 2.—Diagram showing Minimum Body Dimensions for Tourist Trophy Cars.

The body shall be substantially constructed, and the dimensions shall not be less than those indicated in Figs. 1 and 2. The body shall be easily removable, by undoing not more than six bolts or hinges, and this removal of the body shall not entail disconnecting any part of the ignition apparatus, mudguards, lubricator connections, fuel pipe work, the fixings of any tank, or any pipe connection to the tank. Efficient mudguards shall be fitted to front and rear wheels, and shall be flat and set without splay. The steps must be continuous with the mudguards, and steps and mudguards must be attached to the chassis only. The width of the front mudguards shall not be less than 10 in., and at the back mudguards and footboard not less than 8 in. No part of any mudguard or footboard shall be less than 8 in. from the ground when the car is fully loaded.

With reference to the pressure tank specifications, the air vessel must be fixed as shown in Fig. 3, and may be formed of a piece of brass tube with thick ends sweated in and drilled to receive at the top end two pipes, not more than  $\frac{1}{8}$  in. and  $\frac{1}{4}$  in. bore, as shown, sweated in; at the bottom a  $\frac{1}{2}$  in. gas plug drilled for a sealing wire; sealing lugs shall be provided where shown. The air vessel is to be fixed in an accessible position either at one end or at one side of the tank. Although shown as made with a piece of brass tube, the air vessel may be otherwise made, provided the dimensions, strength, good attachment to tank, and the fittings be as shown. The tube X from air vessel E to the tank must not be more than  $\frac{1}{4}$  in. diameter, and must be sweated into place on the tank; there shall be formed two complete convolutions in the course of its length as shown. The coils may be oval, to reduce the height if necessary to, say, 1 in. The soldered tube Y, to which the pressure valve, pressure gauge, hand pump, &c., may be connected, may be  $\frac{1}{4}$  in. diameter, and may be provided with a union at about 12 in. from the air vessel. A filler  $4\frac{1}{2}$  in. clear diameter of open-

ing, as shown in the diagram, with removable gauze filter. A connection for the pressure supply with air vessel as shown at E. An outlet pipe for petrol to the carburettor, 13-16 in. above the bottom of a sump  $1\frac{1}{4}$  in. deep. (The pipe to carburettor is only indicated as to position in sump, the position of the upper part being to a very great extent at the discretion of the makers). A draw-off chamber with drain plug, with sealing lugs, draining from the bottom of the sump.

Fig. 3.—Details of Petrol Tank (Pressure Feed) for Tourist Trophy Cars.

The gravity tank specification includes a filler with two vent holes not exceeding 1-32 in. in diameter in the cover. A sump B  $1\frac{1}{4}$  in. deep by 4 in. dia., as shown below, provided with an outlet C to the carburettor for petrol. This shall have an inwardly projecting draw off pipe rising  $\frac{3}{4}$  in. above the bottom of the sump. A drain plug G combined with the outlet fitting with lug, as shown, and drilled for sealing wire. If a filter is placed over the outlet pipe in the sump it must be re-

Fig. 4.—Details of Petrol Tank (Gravity Feed) for Tourist Trophy Cars.

movable. The pipe from tank to carburettor must be continuous, without any kind of tap or valve.

M. V. VALLEE, of Paris, is making an acetylene lamp provided with an auxiliary burner, which can be brought into use when driving in town and the larger flame extinguished, the control being from the dashboard.

## CLUBS AND ASSOCIATIONS.

### NOTTINGHAM

THE annual dinner of the Nottinghamshire Automobile Club, which was held at the Victoria Station Hotel, Nottingham, on Friday last week, proved an entire success. Mr. C. Hardy, the President of the Club, was in the chair, and nearly 200 ladies and gentlemen attended, including the Hon. A. Stanley, M.P., chairman of the A.C.G.B.I., Mr. Arthur Richardson, M.P., Lieut. Col. R. L. Birkin, D.S.O., the Mayor of Nottingham (Ald. J. A. H. Green), the Chief Constable (Mr. P. S. Clay), the City Surveyor (Mr. J. E. Webb), the County Surveyor (Mr. E. P. Hooley), the Clerk to the County Council (Mr. H. H. Copnall), and Messrs. Julian Orde, Rees Jeffreys, F. Coleman, E. M. C. Instone, P. Richardson, C. E. Wells Lucas, Ross Browne, C. Edge, H. Bircumshaw, W. D. Wells, and Booth Granger, the hon. secretary of the club. Following the loyal toasts, Mr. A. R. Atkey proposed "The Parent Club, the Motor Union, and Automobilmism," and remarked that the parent Club, by virtue of its very designation,

spring. Amongst other things given over to the Club was that of conducting all foreign relations, and he was glad to assure them that their relations with all foreign powers were extremely friendly. They had twice during 1906 met all the foreign clubs in France, and it was found that they had very much in accord over all matters concerning automobilism. More especially they were all animated by the desire that they should tour in each other's country, and that facilities for touring should be made as easy as possible. The Club had but one aim, and that was to be as useful as it possibly could to the greatest number of people. Mr. E. M. C. Instone, responding for automobilism, gave some striking statistics as to the growth of that portion of Coventry in which the motor industry might be said to have its home. Whereas in 1898 the houses in the locality concerned totalled but thirty-two, with a gross rental of £1,784 and a rateable value of £1,484, in October last there were no fewer than 510 houses, the gross rental of which amounted to £9,677 and the rateable value stood at £7,986. These figures, he considered, afforded a lesson to all municipal authorities as illustrating the importance of welcoming and encouraging the development of the new industry.

Mr. A. Barlow, in submitting "The City and County Authorities," stated that they lived in a favoured, instead of in a benighted county, such as Surrey. They owed a great deal to the administration of the law by the police authorities of the city and county, and they owed, perhaps, more still to the splendid manner in which the roads of the county were kept in form. The Mayor (Ald. J. A. H. Green) responded in a felicitous and humorous speech. For a long time he had been filled with admiration of automobilists, and he thought he had ceased to wonder at any feats

The Annual Dinner of the Nottinghamshire Automobile Club.

might be considered the father, the Motor Union the son, and automobilism as the moving spirit that pervaded them all. At first it was thought that the two bodies might come into conflict, but there had been a cementing of ties between them that rendered their work harmonious.

The Hon. Arthur Stanley, M.P., responding to the toast on behalf of the Motor Union, remarked that one of the principal functions delegated to the Motor Union was that of preparing in every possible way for legislation with which they were always being threatened. He did not know whether this year they would get through without legislation. But whenever legislation did come forward he would have a list before him of all those members of Parliament who, at the time when they wanted the loan of motor-cars for the elections, pledged themselves to help them. He had not the slightest doubt that those pledges would be kept in the way a member of Parliament always does keep them. It was owing to the provincial clubs that the Motor Union gained a great part of their strength, and if they were successful in their efforts not only in legislation, but in other things, it would be by the support they received from all parts of the country; and in no part were they more kindly met than in Nottingham. Mr. J. W. Orde, on behalf of the A.C.G.B.I., said that the parent club was very proud of the 3,000 children of its own, and of the ten or twelve thousand more of which it was god-father, but probably the child of which it was most proud was the Motor Union, which did so much work for them all, and to which the Club subscribed largely in order that it might never be in want of funds. The Motor Union and the Club settled certain little differences they had last

they might perform. But finding that distinguished assembly of "the criminal class" afforded such a kindly welcome to the authorities he thought his powers of wonder were not exhausted. In the company of motorists one travelled quickly, and during the previous three hours he had been carried in his mind to the city of the future. In that city he saw nothing but dustless and noiseless streets, traversed by a multitude of motor-cars, whose occupants had their handsome visages all naked and unashamed. In this city the rates had retreated to vanishing point, for such small civic expenses that still existed were defrayed by contributions willingly paid by penitent motorists, who travelled at less than sixty miles an hour—and he thought they would agree that this was a reasonable penalty for the time that they wasted. Mr. H. H. Copnall, replying for the county authorities, said that that body had no desire to increase their funds by fines from the "criminal class" represented there that night, and he was pleased to see that the amount received in fines from Nottinghamshire motorists during the past year had been very small. If the Nottingham Club continued to recognise the comfort of people on the roads, and to carry out the requirements of the law to such an extent that there could be no reasonable objection to them, the friendly relations between motorists and the county authority would continue and increase.

Mr. F. Coleman submitted the toast of "The Nottingham Automobile Club," and spoke in terms of admiration of the way sporting matters were dealt with by the club. He was always sure when he came to take part in any of the Nottingham competitions of getting a perfectly "square deal," and a "run for his money." Responding to the toast, Mr. C. Hardy, the President, referred to the criticism they had

been subjected to in regard to the competitions, and said it was gratifying to hear Mr. Coleman's declaration. Mr. Hardy also announced that the committee had arranged an interesting programme to keep members together during the winter season. Mr. Booth Granger, the hon. secretary of the club, also replied, remarking that they were hoping to increase their membership amongst motorists outside the city, and that probably at a later date steps will be taken to form branches of the club in different parts of the county.

On the proposition of Dr. R. G. Hogarth "The Visitors" were toasted, the names of Mr. A. Richardson, M.P., Mr. P. S. Clay, the Chief Constable, and Mr. E. P. Hooley, the County Surveyor, being coupled, and each of those gentlemen responded. The speech of Mr. Clay was of an exceedingly humorous character and throughout showed a friendliness to motorists which was greatly appreciated. Mr. Hooley, as was to be expected, dealt with the subject of roads, and in the course of his instructive remarks stated that while the first cost of the dustless roads which it is now possible to construct is five times that of ordinary roads, yet their durability is so much greater that at the end of nine years the total outlay—first cost and maintenance—is greatly in favour of dustless roads. The programme was brought to a conclusion by the toast of "The Chairman," which was given with musical honours.

### NORTHAMPTON.

A MEETING of the committee of this club was held at the George Hotel, Northampton, last week, Major P. E. T. Hibbert presiding. The following were appointed official repairers to the club:—The Pychley Autocar Co., Ltd., Northampton; Messrs. Johnson and Wright, Ltd., Northampton; Messrs. Reynolds Bros., Daventry; and Mr. C. E. Robinson, Kettering.

It was resolved that a letter be sent to the members of Parliament for the county and borough of Northampton asking them to speak and vote in accordance with the important resolutions in respect of motor-car legislation that have been adopted after very careful consideration by the elected representatives of the automobile clubs of the United Kingdom.

Mr. C. W. Phipps proposed, and after discussion it was resolved, that the general committee of the Motor Union be asked to approach the Automobile Club with a view to getting them to revise the method now adopted when appointing official repairers with the object of dividing them into, say, three classes, according to their capacity for repairs, stock kept, &c., and to place in the published list of repairers a distinctive mark against those who have been recommended by local clubs. A letter from the A.C.G.B.I. was read, asking for particulars relating to the hills in this neighbourhood where hill-climbing competitions take place, and the hon. secretary was directed to write to the secretary of the Automobile Club saying that as this committee had not held any hill-climbing competitions they had no particulars to give. A letter from the Motor Union asking for the opinion of the committee with regard to holding some special demonstration in view of the legislation likely to take place in the early spring was read, and it was resolved that a letter be sent in reply stating that as the committee considered the Report of the Royal Commission on Motor Cars fairly satisfactory, especially if the suggestions of the National Conference of Motorists were adopted, they did not consider any further demonstration necessary unless in the event of legislation of a particularly hostile character being proposed.

### COVENTRY MOTOR CLUB.

COLONEL WYLEY, commandant of the 2nd Volunteer Battalion Royal Warwickshire Regiment, speaking at the Coventry Motor Club dinner on Saturday night, said he would be only too glad to form a motor-cyclist company, which he believed would be of immense value in an emergency in connecting the Midlands with the seaboard. He feared however, that the authorities would not give sufficient support, as he had already been twice refused permission to form an ordinary cyclist company.

### THE NORTH EASTERN AUTOMOBILE ASSOCIATION

THE monthly meeting of the above association was held at Newcastle, on the 10th inst., with an attendance of ten members. The matters discussed included the question of the present toll of 4d. charged on the High Level Bridge between Newcastle and Gateshead for all motor-cars; the election of new members and receipt of a few resignations from those who have given up motoring or have left the district. Letters from the Motor Union were read and considered with reference to the proposed demonstration in the spring, the support of the Motor Union scheme of legislation by approaching local members of Parliament, and the grant of a contribution towards the cost of the road-tarring competition. The last named matter was left over for the decision of the annual meeting, which will be held on February 15th. The draft annual report was considered, and, with a few slight alterations, was approved. It is expected that this will be sent out to members as soon as the accounts for the past year have been passed by the hon. auditor. Various matters in connection with the improvement of the roads and the fixing of additional warning posts at dangerous places, were considered.

### AUTOMOBILE ASSOCIATION.

IN consequence of numerous requests received from members of the Automobile Association, the Committee are considering the advisability of making arrangements for the provision of legal assistance to members. The scheme, which has been prepared with great care, will ensure the services of expert lawyers to deal with all legal difficulties concerned with motoring.

### NEWCASTLE MOTOR CLUB.

AT a meeting of the Newcastle Motor Club it has been decided to open the season at Belsay on Good Friday. A speed-judging competition will take place in the form of a run over a certain distance, the rider to do the journey in approximate time to a limit set by the committee, such limit necessarily being under the legal limit of twenty miles per hour. The committee intend issuing a monthly programme to keep members in touch with current events.

### MOTOR VAN TRIALS.

A MEETING of the Commercial Vehicle Committee of the Society of Motor Manufacturers and Traders was held last week, at which the chief matters under consideration were the regulations for the proposed van trials to be conducted by a joint committee of the Automobile Club and the Society.

MR. T. D. H. DACRES has been re-elected president of the Birmingham Association of Mechanical Engineers. In his presidential address he referred with satisfaction to the progress of the motor-car industry.

THE Society of Model Engineers held its eighth annual conversazione on Saturday at the Cripplegate Institute, London, E.C.

A Renault Car with Berline body—a type which is very popular among French touring motorists.

A MOTOR-CYCLE club is being formed at Colwyn Bay, Mr. Herbert Emmett, of Rhos-on-Sea, being actively interested in the matter.

THE Coventry Motor Club will hold two open competitions during the present year.

THE annual dinner of the Cardiff and District Mechanics' and Chauffeurs' Association has just been held at Cardiff.

### PUBLIC MOTOR SERVICES.

To a meeting of the Calverley District Council a proposal has been made by a Leeds firm of automobile engineers, who asked to be allowed to run motor-buses between Rodley and Greengates, thus joining up the tramways of Leeds and Bradford. There was a decided feeling against allowing the 'buses to be run on Sundays, and ultimately it was decided to refer the question to a committee to formulate conditions, &c., and examine the 'buses proposed to be engaged in the service.

BELIEVING that "the time has arrived when they should take steps to encourage the introduction of some means of locomotion for conveying the passengers to and from the various villages in the district and the city of Newcastle," the members of the Newburn District Council have appointed a committee, consisting of Major T. R. Rowell, Mr. H. C. McBeath, Mr. Ralph Lowes and Mr. J. Taggart, to wait upon the directors of the North Eastern Railway Company and the Newcastle Tramways Committee with a view to having motor-buses run between the outlying villages and the railway stations or the tram termini.

No motor-car competition can take place in or about Bombay with more than five competitors without the special permission of the Government.

## THE MOTOR-CAR ACT.

### FAILING TO NOTIFY APPROACH.

Arthur Carpmail, residing at Benhill Wood Road, Sutton, answered to a summons at the South Western Police Court, for that he, being in charge of a motor-car, did fail to signify his approach. The defendant, when driving his motor-car along Mitcham Lane, Streatham, collided with a little girl, when she was making her way to attend her school. The defendant, it was said, neglected to sound his horn, and in this way contributed to the accident. The defendant, giving evidence, said he sounded his horn. The girl ran into the car, and when he saw an accident was unavoidable, he pulled up as quickly as he could. Mr. Staplee Firth, defending, maintained that the accident was brought about by the girl's own carelessness and the additional fact that she was deserted by her elder sisters. The magistrate imposed a penalty of 20s. with 23s. costs.

### ROAD REPORTS.

**WILLESDEN.**—Mr. O. Claude Robson, M.I.C.E., the surveyor to the Willesden Urban District Council, in a report to that body, says:—"Even in my own time considerable improvements have been effected in road repair; the main roads of the country forty years since being in no way comparable to those of the present day, whilst in remoter times an even worse condition of affairs prevailed, notwithstanding the paucity of traffic then existing. It is rather the more sensitive character of the vehicle, and equally more sensitive character of the travellers in the present day, that prompt people to condemn the roads of this period and compare them unfavourably with those of Telford and Macadam, than a reliable knowledge of the method of road formation and repair now and in the past. Owing to the modern requirements, therefore, some of the best of the macadamised roads of the present day must give way to wood paving where much motor traffic exists."

**LINCOLNSHIRE.**—A proposal to build a new county bridge over the river Welland at Fosdyke, between Boston and Spalding, should be favourably supported by motorists. It has been approved by the Roads and Bridges Committee of the Holland County Council, and now only awaits the sanction of the County Council.

**REDBOURNE.**—Motorists travelling along the Great North Road will just now find a large number of unrolled stretches of new metal on the section between St. Albans, Redbourne, and Dunstable.

**EPSOM.**—Loop Road, between College Road and Burgh Heath Road, has been under repair. Headley Road is now being taken in hand by the staff of Mr. E. R. Capon, C.E., the Town Surveyor of Epsom.

**ISLINGTON.**—At the North London Police Court the Highgate Hill Tramway Company (Ltd.), has been summoned by the Islington Borough Council for not maintaining and keeping in good condition and repair that portion of Highgate Hill between the tram lines and the kerb, for which, under the Tramways Act of 1870, they were liable. The company agreed to comply with the Act of Parliament forthwith.

**PERTSHIRE.**—After three years' experience of motor traffic under existing regulations, the road authorities of Perthshire are not satisfied that the public interests are adequately conserved, and an application has been made to the Secretary for Scotland to grant a closing order for certain additional roads, and to restrict the speed on a number of others. Objections thereto have been made by the Automobile Club, who argue that there is no reason for departing from the well-considered judgment which was arrived at when the matter was last investigated. The reply of the County Council is that further experience has shown that the restrictions asked are necessary, and are only asked in cases where the roads are very narrow or for other specific cause, and after due consideration by the road authority, who are familiar with the character of the roads and the traffic thereon. The Secretary for Scotland has appointed Mr. Alex. Stuart, advocate, Edinburgh, to visit the several districts, and report on the application, after allowing the County Council and those who have objected to appear before him and state their views.

**BIRKENHEAD.**—Motorists have for many years been inconvenienced by the narrow portion of Bidston Road opposite St. Saviour's Church, and also by a length of road known as Mill Hill, leading from Talbot Road to Ingestre Road, Birkenhead. This latter portion of road is not sufficiently wide to permit of the formation of footpaths for the use of pedestrians, and, owing to the road being very narrow and forming a sharp curve, many narrow escapes have been experienced by motorists and pedestrians. These two points are on a line of road much frequented by motor-cars passing from the residential district of Bidston to the Chester roads. The Corporation have for many years been in negotiation with the Earl of Shrewsbury's agent for the acquisition of the necessary land and buildings for widening and improving these portions of road, and after protracted negotiations terms have now been arranged, and the necessary works will be put in hand forthwith under the direction of Mr. C. Brownridge, the Borough Engineer and Surveyor.

**STREET STANDARDS.**—The attention of the Local Government Board has been drawn to the electric standards that have been erected in Oxford Street between the Marble Arch and Oxford Circus by the Roads Improvement Association. Unfortunately the matter is not one in which the Board has any authority to intervene. The erection of standards in the middle of the street is a practice that has been condemned by the Royal Commission, and it is satisfactory to learn that other districts in London which have in years past erected such stand-

ards are now removing them. For example, the borough of St. Pancras has recently been at considerable expense in taking down the central electric standards which obstructed the Marylebone Road between Portland Road Station and Tottenham Court Road.

### COMPANY NEWS.

#### NEW COMPANIES.

**INVICTA MOTOR COMPANY.**—£500. Mr. G. Sproston is sole director. St. John's Road, Tunbridge Wells.

**HOOPER AND SONS.**—£17,000 (£10). To adopt an agreement with Mr. W. E. Hooper and to take over the business of a coach and motor-car builder, repairer, and agent, carried on by him at Liverpool and West Derby. Mr. Hooper is permanent director. 6, Slater Street, Liverpool.

**PATENT TYRE PROTECTOR SYNDICATE, LTD.**—Capital £7,000. To purchase the rights in an invention relating to improvements in wheels. 162, Buchanan Street, Glasgow.

**UNITED MOTOR-CAR COMPANY.**—Capital, £253,000. To adopt an agreement with the United Investment Corporation, Limited, and to carry on the business of proprietors of motor-cabs and other conveyances, &c.

**PERI TYRE COMPANY.**—Capital, £2,000. To adopt an agreement with J. T. Akerman and J. C. Akerman, 37 and 39, Essex Street, W.C.

**LINDSAY MOTOR MANUFACTURING COMPANY.**—Capital, £5,000. To take over the business of motor-car manufacturers carried on at Woodbridge, Suffolk, as the Lindsay Motor Car Company, and to adopt an agreement with Mr. J. L. Scott, who will be sole director and manager.

### MOTOR-CAR ACCIDENT.

THE circumstances of a motor-car accident at Manchester, which terminated fatally, were explained to the Manchester Deputy Coroner on the 9th inst., when he was inquiring into the death of a carter named Samuel Kelshaw. On New Year's Day Kelshaw, it was stated, had been working until late in the afternoon, and early in the evening he went out with a friend. Half an hour later he was at the corner of Liverpool Road, and was crossing the road, when he was knocked down by a motor-car, stated to belong to and being driven by Mr. Henry Hollindrake, of Edgeley, Stockport. After hearing the evidence of Mr. Hollindrake, the Coroner said the jury had nothing to do with any civil liability that may arise; what they had to say was whether or not there had been any criminal liability, and whether Mr. Hollindrake was to blame or not. The Coroner did not think he was criminally responsible. The accident may have been inevitable, or it may have been the man's own fault. After a brief retirement the jury returned a verdict of "Accidental death."

### CLAIMS BY MOTORISTS.

IN Greenock Sheriff Court, Sheriff Neish has given his decision in an action for damages by Edward Robert Budd, Eureka House, Dumbreck, against Daniel Cunningham and Sons, contractors, Kilmacolm. Pursuer asked for £207 in respect of personal injuries and damage to his motor-car. The condensation set forth that on or about July 3rd, 1906, the pursuer, in company with Mr. John Ritchie, was driving his motor-car from Largo to Glasgow. As he was motoring along the highway at or near Kilmacolm the car dashed into wires which had been stretched across the road by the defenders at a height of three feet six inches, by which the car was smashed and the occupants injured. The sheriff finds that the accident occurred through the fault of the defenders, and awarded pursuer £57 and expenses. In an action by John Ritchie, clerk, Ellimore House, Dumbreck, the other occupant of the car, the sheriff also found Messrs. Cunningham liable, and awarded pursuer £20.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

## COMMENTS.

IN the multitude of counsellors there may be wisdom, but in the multiplication of organisations of similar aims there is often overlapping. That is a fact which has now dawned upon those who have been associated with one or other of the efforts made during recent years to reduce the dust nuisance as it is aggravated by the presence of motor-cars on the road. Hence the suggestion that is now being realised for the formation of a national body to weld together the various bands of experts who are tackling the problem in different ways. Our readers are so well alive to the importance of studying the subject that they will welcome anything likely to secure experiments on a scale large enough to give value to their results. Mr. Julian Orde will act as secretary of the new National Dustless Roads Committee, upon which such bodies as the Royal Agricultural Society, the Coaching Club, the Sanitary Institute, and the Royal College of Physicians, as well as the recognised automobile organisations, are to be invited to be represented. Altogether nineteen societies of various kinds have been invited to participate in the new movement, which will be formally inaugurated at a meeting at the Automobile Club on the 7th prox.

### Cases Dismissed at Guildford.

STRANGE things have sometimes occurred at the Guildford Court, and one of the most curious is referred to in our report of a motor case recently heard there. Wonderful to relate, it was dismissed. The circumstances, however, were so typical of what occurs in this country that further reference to the matter may usefully be made. The steam roller was working on the road when the defendant drove his car for a few yards along a footpath where no one was walking. Consequently he was charged by the police with driving in a dangerous manner—a course which even the Guildford Bench saw was neither equitable nor desirable. This matter of road repair is one that should be considered by the local authorities with the view of ensuring room being left for motorists when roads are in course of renovation.

### The Supply of Petrol.

IN his evidence before the Fuels Committee of the Motor Union, Mr. Alexander Duckham emphasised the necessity for some official body to immediately carry out tests, and so convince the motorist that he can just as advantageously use a somewhat heavier petroleum spirit than the grade he now employs, without any alteration to the jet of his carburettor. Such alteration in the standard for petrol would immediately relieve the situation by increasing the available supply by perhaps 50 per cent. or to some 150 million gallons per annum. The price of petrol would be brought down if the market for the residual products could be increased. In fact, it would appear that our chief hope of moderate price and constant supply of motor spirit, in view of the great possible increase in the demand, consists in the extension of the use of heavier products keeping pace with the increasing

demand for motor-car purposes. Concerning the quantity of crude oil available in the crust of the earth, we may regard that as practically unlimited, but it is of the utmost importance to remember that the supply of spirit of the specific gravity commonly used at present, namely, from 700 to 720, only forms on the average about 10 per cent. of the crude oil from the fields. Hence it is extremely unlikely that at anything like the present price manufacturers will distil crude oil for the sole purpose of producing petrol, as they would have to dispose of the other 90 per cent.

### Scotch Law.

AN important appeal on the question of jurisdiction of Burgh Magistrates and Justices of the Peace in Scotland was concluded on Friday of last week, and is summarised on another page. The decision has made it absolutely clear that the J.P.'s have no authority, and that the Sheriff Court is the tribunal under the Act. The case is the most important yet heard in Scotland in connection with automobilism, and the Scottish Automobile Club, at whose instance the appeal has been taken, have rendered a valuable service to the whole motor-car community in securing this determination of the law, by which it is made clear that motor-car cases must be tried before the Sheriff Court, and that burgh police magistrates have no jurisdiction under the Motor Car Act, 1903.

### The Club for the Transvaal.

THE presence of more than 600 owners of motor-cars in Johannesburg should give full scope for the activities of the Transvaal Automobile Club. Mr. F. H. Davis is president and Mr. W. Wolstenholme is hon. secretary. The object of the organisation is to encourage and further the automobile interests of the Transvaal by means of lectures and discussions, arranging for the storing of members' vehicles, organising tours and generally performing the useful service associated with the careers of similar societies in this country. Mr. L. Reyersbach is the chairman of the club committee, upon which are Dr. Bensusan, Messrs. T. C. Dumat, W. H. Wood, H. Hellman, H. S. Stark, J. P. Engel and F. Whittaker. Mr. T. Greig is the secretary of the Transvaal A.C., to which we offer the congratulations of British motorists on the success of its early days.

### Motor-Car Wheels.

LAST week, under the chairmanship of Mr. Percy Martin, a meeting of the Coventry Engineering Society was held at the local Technical Institute, when Mr. Henry Sturmey opened a discussion on motor-car design. His remarks in regard to motor-cars concerned rather the general design of chassis than the consideration of any point in particular. Commencing with the wheels, he said he was very pleased to see that at last the value of large wheels was being appreciated. The Automobile Club, in the rules for the new heavy touring car race, stipulated for 36 in. wheels, and now 34 in. wheels were quite common, whereas until a year or so ago they were very much the exception, and quite the majority of the cars ran upon 30 in. rollers. If they looked at the wheel they would see that the larger the diameter the more readily would

distances be surmounted, hence the smoother and easier would be the running. As to the number of wheels to be used, he thought it might be taken as accepted that for all general purposes four wheels would be found to be best, but upon light cars, where accommodation for one or two passengers only was required, there was much to be said in favour of three. Accepting, then, four wheels as the number they had to deal with, and taking it for granted that they would act in pairs parallel to each other, but little observation would show that, considered solely from the point of view of the comfort of passengers, the further apart they were placed the better, and the smoother running they would get, though this would depend upon the nature and size of the load to be carried.

### Side Slip Competition.

THE examination of drawings submitted in connection with the side-slip and skid prevention competition of the Automobile Club has taken place under the guidance of the Expert and Technical Committee, assisted by representatives of leading motor-bus services in London. There were no fewer than forty-one entries, and only two were withdrawn before the inspection of drawings. Of those that remained twenty-seven

Mr. H. R. Dixon at the wheel of his 40-h.p. six-cylinder Napier Car, which he has just taken out to Sydney, after an extended tour in this country.

Mr. Dixon is one of the principal directors of the Dixon Tobacco Company, of Sydney, a branch of the American Tobacco Company, and has for a number of years taken an active interest in motoring. His firm used a motor-tricycle for opening up business in the back country of Australia over ten years ago, the little machine covering tens of thousands of miles with great success.

were rejected as impracticable, leaving twelve for the preliminary test, which will take place on the 5th prox. at the Clement-Talbot works in Ladbroke Grove, London, W. It is to be hoped that some really effective device may be brought into prominence by the competition.

### The Motor-Cycle.

ELSEWHERE we give some points from the speeches made at the annual dinner of the Auto Cycle Club, the organisation of which has been so successfully secured by Mr. F. Straight. It was generally agreed that the perfect machine had not yet been evolved, and that the silencer competition might be productive of a factor conducing to that state of finality. The motor-cyclist should remember that the public is somewhat critical with regard to the noisy progression of his slim machine on the roadway, and that the education of the present generation will be quickened in proportion to the silence of the cycle. Some remarks with regard to the machines likely to be popular aroused dissent from many of the experts present, one of whom will discuss the subject in our columns next week.

### Trams v. Buses.

FEAR of the competition of the electric tramways which are promised at Torquay led the shareholders of the Torquay Motor Omnibus Co. to agree, on Tuesday, to the sale of their eight omnibuses to the Harrogate Road Car Co. Doubtless those responsible for municipal traction schemes will rejoice at such a result, and some of the members of the London County Council may have been inclined to object to the regard with which many councillors treated the motor-bus at Tuesday's meeting of that body. The Highways Committee recommended that the Home Secretary be urged, having regard to the heavy wear caused to the public streets by motor-omnibuses plying for hire, to consider whether legislation should not be introduced requiring a proper contribution to be made by the owners of these vehicles towards the cost of maintaining the streets. Against this Mr. W. W. Bruce raised a question of inconsistency. Such an attitude was in opposition to the Council's policy of attempting to solve the housing problem by inducing the people to go out into the suburbs. He considered that the motor-omnibuses were doing a very useful work, although no doubt a good many people objected to the noise. He moved to omit the reference, and ultimately Captain Hemphill withdrew the report after Mr. Dickinson said it seemed to him that the Council would be making a very great mistake if they were to advocate a tax on motor-buses. That mode of locomotion was unpopular at present, but it would rapidly become popular, and what the Council should aim at was that the control over motor-omnibuses should be adequate and in proper hands.

### Level Crossings on Highways.

AN important test case has been argued before the Board of Trade as to the whole policy of light railways having the use of highways. The promoters of a light railway from Ripon to Kirkby Malzeard, in Yorkshire, had got a level crossing in the borough of Ripon passed by the Light Railway Commissioners, and the opponents took the view, not against the light railway as a scheme, but that no light railway should be allowed to have a level crossing where the line could be carried either over or under a public highway. They said when railways were allowed under the Act of 1845 to cross public roads it was thought that the roads in future would only be used by agriculturists, and the advent of the motorist was not dreamt of. Therefore the Board of Trade's policy should be to prevent the use of the highways in such a way as to cause danger or inconvenience to the travelling public. There was a cardinal distinction between tramways which were promoted for the benefit of the people living in the locality and light railways which were constructed by private enterprise for their own benefit. The Motor Union urged the great increase of motor traffic for pleasure, and also for industrial purposes, as a reason why the Board of Trade should prevent these light railways from crossing main roads in future. Sir Herbert Jekyll, representing the Board of Trade, said it was the duty of the Board to protect the public from danger, and they would see that that was carried out. As to the inconvenience of a level crossing, which was always more or less objectionable, considerations of public benefit must have due weight. The Board of Trade would carefully consider the arguments, and give decision to the parties in writing.

### The Fly in the Spider's Web.

MR. PLOWDEN is the witty wisacre of Metropolitan magistrates, and his judicial utterances are generally useful for the newspaper paragrapher. The other day, when some motor-bus drivers were summoned at Marylebone, they asserted that their pace was not nearly so great as alleged. "Your defence," remarked Mr. Plowden, "would be good if it stood by itself; but there is another side, which is supported by stop-watches. They may or may not be infallible, but they hold the field. Nothing better has been invented at present to take their place."

And so long as stop-watches hold the field it will be easier for a fly to break through the spider's web than for a motor-car to hope to escape when it once falls into a police trap. Therefore, though I don't withhold from you my sympathy, I must, under the spell of these watches from which there is no escape, fine you." We quite agree as to the absence of chances of escape for the motorist unfortunate enough to fall into a police trap.

#### Cordingley's Show.

PREPARATIONS are now well in hand for the twelfth of the annual series of Motor Car Exhibitions held at the Agricultural Hall, London, by Messrs. Charles Cordingley and Co. Coming so closely to the beginning of the selling

season of the year, it affords makers and agents a splendid opportunity to introduce their new models to the many prospective motorists who are delaying their plunge into automobilism till April in order to investigate the latest models before purchasing. This year, more than ever before, the capacity of the Hall, with all its galleries and subsidiary halls, will be taxed to the utmost, and the bookings from new

want of room. The Hall will become the largest exhibition building in the world, apart from the Grand Palais at Paris. In addition to the sites of the houses the areas of three streets will also be covered. This will be good news for the motor industry, which has come to regard the Agricultural Hall exhibitions with so much favour.

#### Yorkshire Opposition.

REALLY some of the active motor-car organisations in Yorkshire should keep a watchful eye on Alderman Milnes Gaskell, who generally takes advantage of every seasonable and unseasonable opportunity to deliver himself of a little

homily on motor-cars. He does not always treat them with the respect they deserve, and his review of the past year's work of the important body over which he presides contains the usual collection of smart sayings against the automobile, together with his own reflections thereon. He wants further powers against the motorist given to local authorities, and really believes that "in many cases the driver of a motor-

A Reminiscence of King Edward's Last Visit to Germany. His Majesty enjoying a Motor Trip with the Kaiser. *(L'Automobile, Milan.)*

firms, as well as from those long familiar to the trade, prove the continued popularity of the pioneer motor show in this country.

#### Extension of the Agricultural Hall.

THE difficulty of accommodating all the exhibitors who have sought admission to the Cordingley Motor-Car Shows at the Agricultural Hall, London, has been an increasing one, and bold steps have, at last, had to be taken to deal with the

matter. Consequently visitors to the famous venue at Islington will find many improvements by April. The Upper Street entrance has been greatly improved, while the reception yard in Barford Street is being covered with a glazed roof that will be found to considerably increase the capacity of the building. So much for the improvement practically completed. This, however, does not by any means exhaust the extensions that are in view, and all who recognise the accessibility of the Hall from every part of the Metropolis—by train, bus, tram, or tube—will be glad to know that the company has purchased nearly thirty houses adjoining the present Hall with the view of adding to the building, so that future exhibitions need not be cramped for

car is frankly unable to understand that the roads and lanes of the country and the fulness thereof do not belong exclusively to him. The nursery for the child, the stable for the horse, the kennel for the dog, the bed for the aged, is his cry." To the public at large he says: "Trespass on my highway at your peril; if you do I shall knock you down, maim you, it may be kill you, and if you remember my number the magistrate will let me off with a small fine, and the coroner will say that I cannot be expected to attend to my car and the public at the same time." Naturally the councillors assembled to hear the wisdom of their chairman punctuated his remarks with laughter. There were, however, one or two solid facts, and, dealing with the highways, the Alderman stated that there were 1,042 miles of main roads in the West Riding area, while the mileage of bridges not on main roads was 52 miles, and the total number of bridges and culverts repairable by the Council 800. The cost increased steadily; the total expense for the year ended March, 1903, was £159,399, and for the year ended last March, £182,150, an increase of £22 per mile, or 14 per cent. The urban district road increased £52 a mile and the rural district road £2 in that period. Of course he attributed the increased cost to his pet aversion.

### The Ameer's First Ride.

WITHOUT wishing to depose this worthy Alderman from his position of service in his country, we would suggest that the Ameer of Afghanistan is really more tolerant to modern advance than many of our own country wiseacres. Recently His Majesty had his first ride on a motor-car in the company of Lord Kitchener, with Captain Jenkins, of the Royal Artillery, as driver. The vehicle was a 24-h.p. Orleans, and so gratified was the Ameer that he requested an example of its full speed on the return journey.

### A Useful Speed Calculating Rule.

WHEN in Nottingham recently we had the pleasure of an interesting conversation with Mr. C. E. Wells Lucas, the solicitor to the Nottinghamshire Automobile Club. Although, owing to the friendly feelings which, as we recently pointed out, exist between the police authorities and motorists in that part of the country, he has relatively a small number of cases to defend for exceeding the legal limit, Mr. Lucas has worked out a very simple and useful rule for quickly checking the speed alleged by the police as a result of their taking the time the car occupies in covering a certain distance. Mr. Lucas' handy rule is simply this: divide the yards covered by the number of seconds occupied and multiply by two, the result being the approximate speed in miles per hour. Thus, taking a furlong—220 yards—and assuming the time occupied was 15 seconds this would give  $\frac{220}{15} \times 2 = 29\frac{1}{3}$  miles per hour, which is very close to the exact speed—30 miles per hour. The rule is one which motorists should make a note of, as, although police traps have, we are glad to say, not been so numerous lately, one never knows when it may prove handy.

### Motor Transit.

MR. E. A. HACKETT, the county surveyor of the South Riding of Tipperary, has been giving evidence before the Commission to inquire into the management of the Irish railway system, and was questioned somewhat closely with regard to the possible chance of the motor-car as a competitor with the railways of the country. He agreed that when the Iveagh-Pirie scheme was first promulgated the roads of Ireland were in a state that would have hazarded its prospects, but was also sure that many of the County Councils have since considerably improved their roads. The authorities are realising the loss their earlier attitude has entailed upon the country, and Mr. Hackett believes that if the scheme could now be revived the Councils would rise to the occasion and have the roads made suitable for the purpose of the new traffic.

### Touring in India.

MRS. HERBERT LLOYD is one of our enthusiastic lady motorists, and is now touring in India. She left England in the early part of last October with her 30-40-h.p. Daimler, with wheels fitted with interchangeable rims and the tyres filled with Elastas. A letter lately received from her, and written at Calcutta just before Christmas, gives an idea of the difficulties of the journey. "We have come two thousand miles over the worst roads in the world," she wrote, "with one set of tyres—three of them are still in excellent condition, and look as though they would last us another two thousand miles or more. The fourth is *hors de combat*, but simply and solely because over a most wicked Irish bridge in which we stuck we pulled out a lot of the studs, which in course of time allowed the rubber to disintegrate. However, this happened a thousand miles back, and it is not done for until now. The mistake was having studded tyres at all; they are not suitable for Indian roads, which are too abominable for words. If we had had plain tyres on all four wheels they would have lasted till every shred of rubber had worn away. These filled tyres do not heat so much as ordinary pneumatics; in fact, the unstudded ones

are generally quite cool, though the weather in the Bombay Presidency was most fearfully hot. We do not notice any difference to pneumatics in the running, the bumping and jarring being no greater, and no sort of test could be more severe than these two thousand miles. We have forded rivers, being hauled on and off ferries over mud and stones, and difficulties which sent my heart into my mouth; we have been over roads, miles of them on which we could go no faster than five miles an hour, and we have crossed bridges of boats and about 100 'Irish bridges,' which only by courtesy could be called bridges at all. And yet we have enjoyed it most thoroughly, and we are all very fit and well. Only two other cars have done the journey, and I do not know how much they did of it by train. We have done it all but thirty miles by road. One of these two cars used twelve sets of tyres. We are now off to Darjeeling, and from there to the Punjab."

### Long Distance Trials.

THE arbitrary nature of the fee hitherto charged for the Long Distance Trials of the A.C.G.B.I. is said to have a deterrent influence on many firms otherwise willing to submit their cars to official tests. In future this will be determined jointly by the Technical and Finance Committees, who have been instructed to keep the expenses as low as possible, so that makers shall be encouraged to undertake trials of this kind. There is a certain amount of boldness required in entering a vehicle for these long distance trials, for so many factors enter into the calculation that ill-luck may destroy the value of the effort. Still, the certificate obtained at the end of such a run is worth having as an assurance that the public will accept as to the reliability of the test and the car alike.

THE Maudslay Motor Company, Coventry, have lately completed a 30-40-h.p. motor-van for the G.P.O. Stores Department, Mount Pleasant, E.C.

MR. R. LAMB is about to start on an extended business tour throughout the country on a "West" car, with a view of appointing agents for its sale.

THE Liverpool Motor Show opens on the 25th inst. with the new firm of Argylls Liverpool, Ltd., among the largest exhibitors, their display including a 17-20-h.p. new type landaulet.

THE Renard road train, which was described in our columns at the time of its introduction at one of the Paris Motor Car Exhibitions, is likely to be seen on British roads ere long, a company being in course of formation to introduce it into England.

EXCITEMENT has been keen in Baldwin's Gardens owing to the capture, red-handed, of a couple of miscreants, who succeeded in raiding the premises of the E. M. Bowden's Patent Syndicate Ltd. Possibly they were tempted to the deed by the reported prosperity of the motor industry, and anticipated in consequence a hoard of wealth to reward their enterprise.

A SOMEWHAT amusing incident occurred at the recent Paris Show. Mr. Huntley Walker, Mr. Lee-Guinness, and Mr. W. Guinness, seeing a new 40-h.p. Weigel car standing outside the *Salon*, which they knew was the property of Mr. Weigel, thought that they would borrow it. Mr. Guinness started up the engine in the usual way, and then putting the first speed in, Mr. Walker started to mount the Champs Elysees. When getting on to "second," the engine showed signs of stopping. He immediately changed down again to the first speed, and proceeded on his way, amid the chaff of the two brothers Guinness and Mr. Warwick Wright, who was also one of the passengers. Mr. Walker did his best to explain what the trouble was, and the party finally arrived at the Elysee-Palace Hotel, where they discovered that the engine was running at half compression. Mr. Guinness had never started a Weigel before, and did not know that there was a half-compression device—a fact which also escaped the memory of Mr. Walker—which had been put in action at the end of the previous run. The fact that the car contained four world-renowned record breakers makes the incident very curious.

## A RUN ON A BROTHERHOOD CAR.

WE had a striking illustration a few days ago of the way in which the modern automobile is rapidly becoming a serious rival to railways by its ability to swiftly and reliably transport people from one part of the country to another. The occasion was the annual dinner of the Nottinghamshire Automobile Club, when, at the invitation of Mr. Percy Richardson, the managing director of the Sheffield Simplex Motor Co., we accepted a seat on a 20-h.p. Brotherhood car for a run down to the city of lace. It is seven years since we made this particular trip, and, curiously enough, Mr. Richardson was then our pilot. In those days there were always sufficient incidents on the journey to provide useful material for a good "story," whereas now the modern automobile swallows up the milestones with such a degree of regularity and reliability as to render the task of the motoring scribe anything but an easy one. Suffice it to say, therefore, that the only stop on the way down was that for lunch at Northampton; even the puncture demon for once looked the other way as we sped along, notwithstanding the fact that many uninviting patches of unrolled new metal had to be traversed. The return journey on the following day was equally devoid of incident, although in parts the roads were somewhat treacherous, and, consequent on a late start, the last thirty miles had to be done in the dark. Altogether the outing was a most enjoyable one, the more so in that it gave us an opportunity of noting the behaviour and efficiency of two radical departures from the standard practice which form the predominant features of the Brotherhood car—the automatically advanced and retarded ignition and the foot control of the engine, by means of which the steering wheel is rendered quite clear of levers, leaving the hands of the driver free for steering and for operating the change-speed and hand-brake levers. The pedal controlling the lift of the inlet valves is neither of the push nor press down type, but has a to-and-fro sliding movement, so that by slightly moving the sole of the foot to the right or left, without lifting the heel from the floor-board, the speed of the engine can be regulated as desired. After a spin of 250 miles on the vehicle, we are free to say that the system gives excellent results in practice; the automatic control of the ignition is such that the timing of the spark adjusts itself to the speed of the engine instantly and without any action on the part of the driver, and at no time, even when climbing a stiff hill, could we discern any sign of knocking. As for the sliding pedal, one quickly becomes accustomed to its movement and able to adjust the motor speed to a nicety with a minimum of exertion. Although, as has already been recorded in the *M.C.J.*, the name of the car is being changed from the Brotherhood to the Sheffield Simplex, the main points of the design, including the two above referred to, are being retained in the new models which will shortly emanate from the large new factory now approaching completion at Tinsley, near Sheffield.

SPECIAL provision is made in one of the large motor garages in New York for the chauffeurs when off duty. In the rooms devoted to them are not only comfortable chairs and lounges, lavatories and shower baths, but a billiard table and a barber with his chair and complete outfit. The latter is not only a great convenience to many of the drivers, but is an obvious suggestion to every one to look to his personal appearance, and leaves no excuse for not doing so.

THE quarterly issue of Departmental Decisions comes from the office of the "Local Government Journal." It is the only one of its kind published and gives over 142 decisions, by six Government departments, bearing upon administration. Every branch of local government is affected, and, inasmuch as such decisions are not only legal interpretations of law by the Departments concerned, but form precedents which govern similar cases wherever they occur, the use of the book by all engaged in the conduct of local government is a necessary part of office administration.

## IRISH DOCTORS AS MOTORISTS.

MANY medical men in Ireland have adopted the motor-car, and in a country so sparsely populated as is the Emerald Isle its advantages are even more readily recognisable than in lands more congested. Dr. Gerard J. Pierse, of Lixnaw, co. Kerry, has had an 8-h.p. three-seated Chambers car in constant service for nearly a year, and has driven it over 5,000 miles of the worst roads in Ireland during that time. To have covered that distance by ordinary methods of locomotion two horses would have been required, and their cost would have been considerably more than the maintenance of the car. Dr. Pierse calculates that his future expenses for running the vehicle will be less than £40 yearly, with a mileage of 6,000.

Another of the medical men who save time and gain pleasure from motoring in Ireland is Dr. J. M. Heron, of Downpatrick, who is to be seen in the accompanying illustration at the wheel of his two-cylinder Star upon which he recently travelled five hundred miles in fifteen days—by way of holiday. His route was from his home to Dublin, via the historical town of Drogheda, and then by way of Athlone and Ballinasloe to Galway and into

Dr. J. M. Heron on his Star Car.

the Connemara district, with its varieties of roads—a few good, some bad, and many indifferent. Thence the route was through Westport, Mullaranny, Sligo, Enniskillen, Dundalk, back to co. Down. Home again, Dr. Heron was able to contemplate the pleasure of a holiday with a well-behaved car that ran safely and reliably all the way.

It is a notable fact that both the gentlemen we have named have a mechanical aptitude and drive and look after the cars themselves. They are convinced that owners of automobiles can materially add to the pleasure of possession by taking an interest in their vehicles and being capable of effecting the little adjustments that are required from time to time to maintain the good character of their cars. It has often been noticed that doctors, who are accustomed to diagnosing cases, are frequently as expert in locating the complaints and troubles of their cars—a fact to which something of the popularity of the automobile among members of the medical profession may be attributed.

THE New Engine Company have lately completed a 30-h.p. N.E.C. car for Mr. T. W. Bacon, of Ramsden Hall, Billericay.

## SOME CURRENT TOPICS.

### The Institution of Automobile Engineers.

We are glad to be able to record that, now the headquarters have been moved to London, the Institution of Automobile Engineers appears to have at last entered on a career of activity and usefulness. The opening meeting of the session was held in the spacious lecture hall of the Institution of Mechanical Engineers, at Storey's Gate, Westminster, on Wednesday of last week, and it was exceedingly gratifying and decidedly encouraging to find an audience of at least 150 gathered together to hear the reading of Mr. F. L. Martineau's paper on "Accessibility and Cleanliness and the Best Means of Attaining Them." An abstract of the paper will be found elsewhere in the present issue, and although it will be seen from this that the author is a strong partisan of the horizontal type of motor, it will also be realised that he has given very close attention to the points he set forward for discussion. His conclusions are therefore well worthy of careful consideration.

circuitous streets of towns. In the case of town carriages the length of wheelbase was absolutely regulated by the condition of the streets. On the question of vertical *versus* horizontal engines, he considered that the attempts which had been made to obtain a short wheelbase by placing a vertical engine under the driver's seat were worse than putting a horizontal motor under the chassis. In regard to the question of casting cylinders separately or in pairs, he considered that the author's experience of having to replace only five cylinders rather proved that the question of being able to dismantle one cylinder without disturbing the others was not a very important one. There were substantial advantages in casting the whole of the cylinders in one or two pieces, while there was nothing very serious to urge against the practice in the way of replacements. Mr. A. Craig, of Coventry, proved a strenuous advocate of accessibility, the suggestion that parts should be made inaccessible so that incompetent people could not interfere with the adjustments being to his mind nothing less than ridiculous. The chief item in most repair bills was not for the repair itself but for taking the car down and putting it together again in order that the necessary work could be carried out. The business side of the motor movement would compel engineers to make things accessible, and if they realised the importance of this point in time they would have a chance of keeping the British industry a step in advance of foreign competitors. Mr. Legros spoke in favour of accessibility, but

Motor Lorry and Trailer Utilised in the Commissariat Department of the Swiss Army.

### Accessibility and Cleanliness.

At the same time many of the motor engineers present did not entirely agree with Mr. Martineau. Thus Mr. F. Lanchester, who Col. Crompton, the President, called upon to open the discussion, held that accessibility could be carried too far and considered it better to give more attention to reliability and to the reduction of the number of parts in a car. In regard to the question of horizontal *v.* vertical engines, the choice unfortunately lay not with the designer but with the public, whose wishes had to be observed. Mr. R. W. A. Brewer also thought that too much accessibility was a dangerous thing, seeing that the men who ordinarily had the care of motor-cars were not competent to make other than the most simple adjustments. It often happened that the most easily accessible parts were those which rarely required attention, while those portions which went wrong were awkward to get at. Many of the parts, such as pistons and cam shafts, which were with great pains made easily accessible, only needed looking at about once a year, provided they were properly designed.

### Short *v.* Long Chassis.

Mr. H. Austin agreed with the author that cars should be designed and built so as to accommodate themselves to narrow roads and sharp corners, especially as they not only had to be driven along wide country roads but through the narrow and

considered that the subject had to be looked at from two points of view: first, the accessibility of those parts requiring frequent attention and adjustment, and secondly, that of arranging the various parts so that they could be readily dismantled.

### The Standardisation of Nuts and Spanners.

Mr. Latham supported the author's suggestion as to the necessity for the standardisation of nuts and spanners, and referred to the work that was being done in this direction by the Engineering Standards Committee. He suggested the co-operation of the Institution of Automobile Engineers in this matter so far as related to nuts and spanners used on automobiles. Mr. Wilson put in a plea for visibility as well as accessibility, while Mr. T. C. Pullinger urged the universal adoption of the metric system as the best solution of the standardisation question. Mr. Martineau, in replying to the points raised in the discussion, stated that he advocated accessibility quite as much from the maker's and repairer's point of view as from that of the user, while, as regards the question of chassis length, he pointed out that long wheel bases generally meant additional weight and higher tyre costs, not to speak of the greater difficulty of manoeuvring in narrow lanes and thoroughfares. Although the discussion wandered considerably from the title of the paper, the points brought out were of interest not only to motor engineers but also to motorists generally.

## THE BRITANNIA CARS.

At the recent Olympia Show considerable interest was shown in the Britannia cars as being a noteworthy addition to the list of British-built vehicles. The manufacturers are a very old-established firm of engineers—the Britannia Engineering Company, of Colchester—who, before putting their machines publicly on the market, have subjected them to exhaustive trials. We have already briefly alluded to their principal features, but, as we are now able to give illustrations of the same, the more complete description of the 18–24-h.p. car now published may not be without interest.

No subsidiary frame is used, the engine and gear-box being bolted direct to the main pressed steel frame by means of side brackets. The four cylinders are cast in pairs, and the bore and stroke are respectively 104 mm. by 130 mm., and the normal speed 1,000 revolutions per minute. The valves are located on opposite sides, and are actuated by separate cam shafts, the

Fig. 1.—Details of Make and Break Mechanism of Low Tension Magneto Ignition of Britannia Cars.

driving gear of which is enclosed in the crank case, inspection covers being provided to admit of their easy examination. The lower half of the base-chamber is also so constructed that it can be disconnected without disturbing the crankshaft bearings. The water circulation is maintained by a gear-driven pump, which can be readily taken down. The radiator is of the honey-comb type, with air-inducing fan, the latter being supported on an eccentrically-mounted spindle, so that any slack in the driving belt may be readily taken up. Large plates are fitted on the tops of the cylinders, which allow the water jackets to be inspected and cleaned at any time. The carburettor, which is exhaust jacketed and is of the automatic air-regulating variety, is bolted direct to the aluminium collecting pipe to give the shortest possible distance between the jet and the inlet valves. Both the jet and float chamber are readily accessible; the latter is fed by gravity from a tank under the seat, and, as will be seen from the sectional view given in Fig. 2, the needle valve is operated direct by the float, so that the valve itself can be ground

on to its seating without removing any part of the carburettor. The sprayer is fitted just over the jet, and a special automatic piston valve with triangular slots admits the extra supply of air.

Fig. 2.—Section of Britannia Carburettor.

In addition to the main throttle, which is controlled from the steering column, an exhaust butterfly valve is provided, this being inter-connected with the clutch pedal; so that when the

Fig. 3.—Section of Britannian Clutch.

pedal is pushed forward to change gear or stop the car, the speed of the engine is automatically cut down.

Two systems of ignition, Simms-Bosch gear-driven low-tension magneto and accumulators, are provided. The tappets, which are located on the inlet side, are a special feature, as the

whole operating mechanism is lubricated by the oil in the crank chamber. The spark itself can be seen and adjusted by simply removing a cap similar to one of the valve caps. Besides this, there is a passage only one quarter of an inch in diameter between the tappet chamber and the inlet valve, which renders it possible to run the engine with any quantity of lubricating oil without it affecting the ignition. The make and break mechanism is illustrated in (Fig. 1, page 1049), from which it will be seen that a face cam K is mounted on the operating shaft I. As the cam rotates it operates the forked arm M, which in turn moves the arm E on the lower end of the vertical spindle O, which passes up through the cylinder casting at the side of the inlet valves. At the upper end of the latter is a cam which lifts the finger B off the insulated plug A, to which it returns quickly by means of the spring A. Lubrication is effected by means of a tank fixed to the side of the chassis, kept under pressure by means of the exhaust, and a 4-drip sight feed rack on the dash conveys the oil to each pair of cylinders, the crank case, and the bearings in the gear-box. The ignition and throttle levers work on a sector above the steering wheel, which does not rotate with the latter.

The clutch, of which a sectional view is given in Fig. 3, is of the leather faced cone type, fitted with flat expanding springs. A universal joint is provided between it and the gear-box, and the tension of the clutch spring can be adjusted by simply turning one split brass nut. The gear-box is provided with long bearings, and a cover practically as large as the whole of the

live axle. The cardan shaft is of solid steel with square ends, brazed solid to the universal joints. The back axle is fitted with Hoffman ball bearings. A feature of the transmission is that the engine, primary gear, and cardan shafts are all in the same horizontal plane.

The dashboard is clear of all mechanism, the lubricating rack and switch being the only fittings. A special gun metal tray is provided to prevent the possibility of any oil dripping on the sloping footboard. The steering gear, the column of which passes through the dashboard, is provided with a large inspection cover which enables the worm and nut to be readily adjusted. A novel fitment is seen in the heel plates fixed on the sloping footboard, below the pedals, so that the driver may have a firm control of the latter. The frame, which is adapted to receive any type of open or closed side-entrance body, is supported on five long springs, the shackles of which are fitted with lubricators. The brakes are all of the metal-to-metal type, and of heavy design; that operated by the pedal is located on the forward end of the cardan shaft, behind the gear-box, and the two rear brakes are compensated and operated by a hand lever, which, when applied, disconnects the clutch. The foot brake is arranged so that the

strain of applying it does not go through the gear-box; it is specially wide and is easily adjusted by two separate ways.

The Britannia Company are also building cars on similar lines of 12-h.p. and 40-h.p. with four-cylinder engines and 30 and 60-h.p. six-cylinder. In conclusion it may be stated that

Fig. 4.—View of Forward Portion of Britannia 18-24-h.p. Chassis, showing the Engine, the Change-Speed and Brake Levers, and the Novel Heel rests below the pedals.

Fig. 5.—General View of the Britannia 18-24-h.p. Car.

case, thereby facilitating the inspection of the gears. Three speeds and a reverse are controlled by a single lever, working in a "gate" quadrant; a safety catch is provided to prevent the reverse being inadvertently engaged. The transmission from the gear-box is by a cardan shaft and bevel gear to a well-supported

the selling rights in the Britannia vehicles have been secured by the Victoria Carriage Works, of Long Acre, London, W.C.

A QUARTETTE of depots—at Cardiff, Tenby, Swansea and Haverfordwest—are run by the South Wales Motor Company.

SIR BOVERTON REDWOOD has been appointed inspector of motor launches on the Thames by the Thames Conservancy. He has therefore resigned from the post of vice-commander of the Motor Yacht Club.

A TRIAL of an electrical carriage over a course of 6,000 miles, under the observation of the A.C.G.B.I., is in contemplation by the Electromobile Company.

M. G. FROISSARD, the English correspondent of "Les Sports" and also the agent for Messrs. Thevin and Company's "Annuaire General de l'Automobile," has removed his offices to 152, Fleet Street, London, E.C.

A FOLDING blotter and writing pad has been issued by the Shrewsbury and Challiner Tyre Company, Ltd., which they will be pleased to send to any motorist making postal application to their works at Kay Street, Ardwick Green, Manchester.

A NEW wind screen for use on motor-cars has recently been introduced by Messrs. Cooper, Webb Jones, and Co., of the Stockwell Works, Walsall. The device is made in two parts; a special joint enabling the upper portion to be set and secured at any convenient angle by the turning of a thumb-screw.

RECENTLY we referred to Mr. C. J. Glidden's motor run on a railway track to Mexico City. Five miles from his destination the car jumped the rails and overturned, the front wheels being smashed. At the time of the accident the total mileage of the car was 39,718, spread over thirty-six different countries.

IN connection with the construction of the Weybridge motor track, a conference of local authorities interested in footpaths proposed to be diverted has been held at Chertsey, when, after much discussion, the meeting came to the conclusion that the rights of the public would not be prejudicially affected by the proposals of Mr. Locke-King, who offered alternative routes which would materially shorten the journey for pedestrians.

To establish a centre for the sale of automobiles and accessories, Motor Auctions, Ltd., is being formed, with a share capital of £100,000, of which 60,000 ordinary shares of £1 each will shortly be issued for public subscription. The directors of the new enterprise will be Messrs. J. B. Martin, H. A. Arkwright, J. W. Davy, S. F. Edge, J. E. Hutton, and U. Stratton, with Mr. Percy W. Northey as the managing director. A site has been secured at 167-177, Shaftesbury Avenue, and 26-30, New Compton Street, London, W.C., on which a new building will be erected for the purpose of auctions. A further site for workshops and garage has been obtained at 412-432, Euston Road, N.W., where a repairing department will be maintained, which, according to the estimates, should return an annual profit of £2,500. It is calculated that the profit from the Sale Mart and Garage will reach £23,900, so that after deducting £13,000 for outgoings, depreciation, and contingencies, there should be sufficient to pay a dividend of 10 per cent. on the ordinary shares, leaving a still larger amount for further distribution between the ordinary and deferred shares. Mr. E. Keynes Purchase, F.R.I.B.A., who is well known in connection with the A.C.G.B.I., is preparing the plans of the new buildings.

WHEN in Nottingham recently we had an opportunity of going over the extensive motor body building works of Messrs. Stareys, Ltd., Parliament Street, and found them of a very complete character. They occupy the upper floor of the repository in which the cars which took part in the memorable 1,000 miles trial in 1900 were stored on the occasion of the visit to the lace city. Keeping pace with the times, Mr. C. E. Norris, the manager, informed us that they have decided to practically give up the horse stabling part of the business and convert the repository into a modern garage. The premises are well adapted for this purpose, and when the necessary alterations are carried out Stareys' Garage will be one of the largest and most complete in Nottingham, as it is intended to put down plant to enable all classes of repair work to be carried out.

## HERE AND THERE.

MR. GODFREY BARING, M.P., has become the possessor of a 30-h.p. Beeston-Humber car.

THE Rosse Motor Car and Cycle Company, Limited, have opened a garage in the Bingley Road, Saltaire.

ACCORDING to a local journal there are in the town of Selangor, in the Malay States, thirty-five motor-cars of French origin, sixteen of English and four of American make.

MR. EDGAR SMITH is the proprietor of the Halifax Motor Company's garage in Weymouth Street, Halifax. His practical knowledge of the motor-car is often placed at the service of local motorists troubled with refractory cars.

A SOMEWHAT novel form of horse-propelled vehicle has recently been devised by M. Bonmarchand, of Clamart (Seine), France. It is known as the Auto-Hippique, and, as will be seen from the accompanying illustration, the idea of the motor-car has been copied as far as possible. The horse is fixed between shafts at the rear of the vehicle instead of at the front, as usual, and has merely to exert its power to propel the vehicle, which is steered by mounting the front wheels automobile fashion and turning them, either to the right or left as desired. According to the circular which the inventor has sent us, the speed of the horse is varied by means of a lever which operates

couple of spurs suitably placed on the rear frame, while the brake consists of a pedal-controlled disc acting on the nose of the horse. The vehicle, which is made either as a two-seated, four-seated *vis a vis*—the latter being illustrated herewith—or as a delivery van, is built of steel, and the road wheels run on ball bearings and pneumatic tyres; its light weight—about 2 cwts.—enables a horse to cover, it is claimed, from forty to sixty miles per day without fatigue. M. Bonmarchand is anxious to dispose of his British patent in the novel vehicle.

THE new Public Vehicle order of the Home Secretary provides that every mechanically-propelled hackney carriage presented for licensing after July 1st, 1907, shall be fitted with an approved taximeter. In such cases the fare for a distance not exceeding one mile or for a period of time not exceeding ten minutes is to be eightpence, and twopence will be charged for each additional quarter mile or for a period of time or a journey not exceeding two and a half minutes.

THE County of Gloucester Garage is situated in the centre of the town of Cheltenham, with entrances from the High Street and Albion Street, and is owned by Messrs. H. E. Steel, Ltd., who supply all makes of cars to clients, teach driving, garage and repair vehicles, examine vehicles, and generally place themselves at the service of present and prospective motorists. They have issued a new price list for 1907, the value of which is increased by distance tables from Cheltenham to more than a hundred other places.

THE Motor Union of Western India has abandoned the Reliability Trials it had proposed to hold this month.

MESSRS. JARROTT AND LETTS have just delivered a 40-h.p. de Dietrich to Lord Armstrong, Cragside, Rothbury.

THE Car and General Insurance Corporation, Ltd., are quoting for the insurance of chauffeurs under the new Workmen's Compensation Act, 1906.

THE Jackson light cars were pioneers in automobiles of that class on the English market, and Messrs. A. Reynold Jackson and Co., Ltd., who are now supplying motor-buses, are still making a speciality of light cars for the man of moderate means.

THE Army Council has approved the scheme for the registration of a limited number of motor vehicles for purchase in time of war and for hire during peace. The form of agreement can be obtained from the Secretary of the War Office Mechanical Transport Committee, Whitehall, S.W.

MESSRS. J. AND R. OLDFIELD, Warwick Street, Birmingham, are placing on the market a garage safety wall oil lamp for lighting purposes, of which we give an illustration. It is a good size, and plenty of light can be secured by its means. In reference to their inspection hand lamp, which we noticed in a recent issue, we are now in a position to state that the heat given from this would also be sufficient to keep out a few degrees of frost in

a closed apartment. The chief claim of the makers, however, is that the lamp can be used for inspection purposes without the slightest fear of any petrol vapour becoming ignited.

A GENTLEMAN recently ordered a cake from a well-known West End firm. He said he would wire as to the form of the ornamental sugar top, and duly despatched the message. "I would like a motor." Unfortunately this got into the hands of a man who knew nothing of the order for the cake. He, wishing to please the firm's customer, rang up the Automobiles de Luxe, Ltd., asking them to send a car from their Regent Street depot to the gentleman in the country. Only when the chauffeur explained by whom he was sent did it dawn upon the buyer of the cake how his innocent message had been misunderstood.

WITH reference to the case recently tried in the Viennese courts, and reported in our columns, in which Mr. Higginbotham, of Macclesfield, recovered £600 deposit paid on account of the price of a racing car which was not delivered when it should have been, Messrs. Dierckx Mercedes, Ltd., of Long Acre, W.C., wish it made clear that they are sole importers and accredited agents for Mercedes cars for the British Empire. If they make a contract for a car of any type, they do so with the fullest responsibility and under a time limit. If this limit is exceeded, they are willing to return the deposit immediately.

MESSRS. WEIGEL MOTORS, LTD., inform us that they have entered two cars for the 1907 race for the A.C.F. Grand Prix.

IT is said that Chinese chauffeurs have become popular in Shanghai, rapidly becoming accustomed to the ways of the motor, and developing real mechanical aptitude.

WE learn by telegraph that the annual motor race meeting on the Ormond-Daytona Beach track, Florida, began on Tuesday. The five miles flying start race was won by Marriott on a Stanley steamer in 3 min. 44 sec., and the five miles standing start race by an American Mercedes in 4 min. 25 sec.

AN interesting discussion is taking place in France as to whether provision should be made to advance and retard the ignition, or whether it should be fixed. The point is an interesting one, and we should be glad to have the views of motor engineers and automobilists in this country on the subject.

READERS are reminded that all cars eligible for the Brooklands racecourse must have been in their owners' possession for at least ninety days previous to the holding of a meeting. As the first meeting takes place in the middle of May, this does not allow of much time in which to construct a car specially, and it is therefore interesting to note that The Motor House, of Euston Road, N.W., have several suitable vehicles, including a 120-h.p. Fiat, which ran second in the Gordon Bennett race; a 120-h.p. and a 90-h.p. Star car, and several other high-powered cars, including Darracqs, Mercedes, Panhards, &c.

OWING to the rapid extension of the demand for Iris cars, the manufacturers, Messrs. Legros and Knowles, Ltd., have found it necessary to divide their sales department from the manufacturing business. For this purpose a separate company, under the title of "Iris Cars, Limited," has been formed to control and facilitate the sale and delivery of these vehicles, and during the next few days show rooms and offices will be opened in the immediate vicinity of Piccadilly Circus, W., under the management of Mr. A. E. Perman. In addition to the cars themselves a stock of lamps, clothing and accessories will be kept on hand.

EUSTON ROAD, N.W., is a Mecca of motoring; the neighbourhood being dotted with a variety of establishments for supplying the requirements of those who motor. At No. 374 in that road some extensive alterations are still in progress which should be noted by all who are interested in the tyre question, for there the New Motor and General Rubber Company is preparing for a great trade in the coming season and getting ready for the orders for tyre repairs that are anticipated to follow the good work that has been done for motorists since Mr. Thomas Warwick became the proprietor. Mr. Warwick was a cycling champion in Australia and also in the South of France more than a dozen years ago, and his entry into the tyre trade will be welcomed by many old friends. The fact that "things are not always what they seem" is well exemplified at 374, which from the exterior is an ordinary six-storied building of rather good frontage. It requires a tour of inspection of the premises that go so far back from the street to gauge the capacity of the concern for re-treading work as well as for the fitting of non-skids of a really excellent type. Among the plant is a stud-making machine that can turn out 50,000 studs a day, and the fact that many other houses in the trade are supplied with studs by the New Motor and General Rubber Company should be assurance to motorists that they are able to deal satisfactorily with single orders from distant parts. In making the non-skid bands, which can be fitted to any tyres, all the studs are fixed by hand so as to give security when in use. The canvas bands are built up in an interesting way, five solutions of rubber being applied, each one being allowed to dry before the next is given, so that a splendid wearing body is secured and the durability of the device enhanced to a good degree. Throughout the establishment, with its conveniences for drying the goods and perfecting every step that is taken in repair, a spirit of enterprise is evinced, and we were struck by the thorough manner in which old tyre canvases are cleansed of all rubber before the work of rebuilding the tread is commenced, an essential feature that should greatly contribute towards the reputation that Mr. Warwick is creating for himself.

## CONTINENTAL NOTES.

## Removable and Detachable Rims.

There was quite a large selection of removable rims at the recent Paris *Salon*, the idea being that the spare tyre shall be carried ready inflated on a reserve rim, which can be rapidly fixed in position. Prominent amongst them were the Michelin, Vinet, and "M. L." In the latter arrangement, which is made by the Societe des Jantes Amovibles, "M. L." of Paris, the rim is held in position on the felloe by six bolts, which can be readily removed or replaced by means of a special brace, the nuts as they are withdrawn being held in a recess in the brace. The Samson Non-Skid Company have also introduced a removable rim, the locking device of which is on somewhat new lines. The cover is carried in the usual form of rim, which slides over the rim of the wheel. In depressions in the latter are fitted six clamps, which when the tyre rim is in position are turned upwards by a key spanner, and so lock it, together with the tyre, immovably on the wheel rim. Special locking studs are provided to take the driving thrust and to prevent the tyre rim creeping on the wheel. Messrs. Leger and Laillault, of Levallois-Perret, showed the Celer, in which the rim which carries the tyre is formed with a narrow ridge on its underside, which rests on the flat tyre of the wheel. The tyre rim is wedged tight and retained in position against the inclined left-hand edge of the wheel tyre by means of a hoop, which can be expanded and contracted by a bolt having right and left-handed threads. M. Jenatzy has also devised a removable rim, which is held in position by a series of wedges. Several rims with detachable flanges to facilitate the fitting and removal of the outer covers were also on view, among them being the Lacouture, made by Messrs. Le Play and Lacouture, of Saint Quentin (Aisne), the Vulcan of Messrs. Bachillet and Co., Paris, and the "V. M." of Messrs. Enfer and Fils, Paris. In the "L. S." detachable rim made by M. L. Stier, of Villers-sur-Marne, the tyre rim is formed in halves with deep webs, which are bolted to each side of the vertical portion of a J-shaped rim, which is part of the wheel. To replace a tyre the bolts are removed and one of the halves of the rim removed.

## The Nice Week.

The Nice automobile week is this year to be held from the 20th to the 27th March. From the preliminary programme just issued we learn that a motor paper-chase is to be held on the 20th, a series of kilometre speed trials on the 21st, a touring competition on the 22nd, a flower fete on the 23rd, and an elegance competition on the 24th. The speed trials, which are to be known as the "Kilometre Bull's Eye," are to be run on somewhat novel lines. The competitors will be divided into three categories, for each of which a certain time for the flying kilometre has been fixed, as follows:—Class A, 35 sec.; class B, 45 sec.; and class C, 55 sec. The winners will be the cars which cover the kilometre in the nearest time to that taken as a basis, only those being classified who are within 4 sec. of the allowance in class A, 5 sec. in B, and 7 sec. in C.

## The French Military Authorities and Motor Vehicles.

General Picquart, the French Minister of War, has decided to have an official census prepared of all motor-cars in France suitable for the transport of men or material in time of war. The heavy vehicles for goods transport will be divided into three classes—those capable of carrying from 1,500 to 2,250 lb., from 2,250 to 3,250 lb., and over 3,250 lb. A separate classification will be made of motor-omnibuses and cars capable of carrying fifteen people.

## A French Light Car Trial.

A somewhat novel competition for light cars is to be held by the Automobile Club of Marseilles on May 26th next. It is to be known as the "Circuit Provençal," and will be open for vehicles having single, double, and four-cylinder engines. The competing vehicles will be handicapped by having to carry

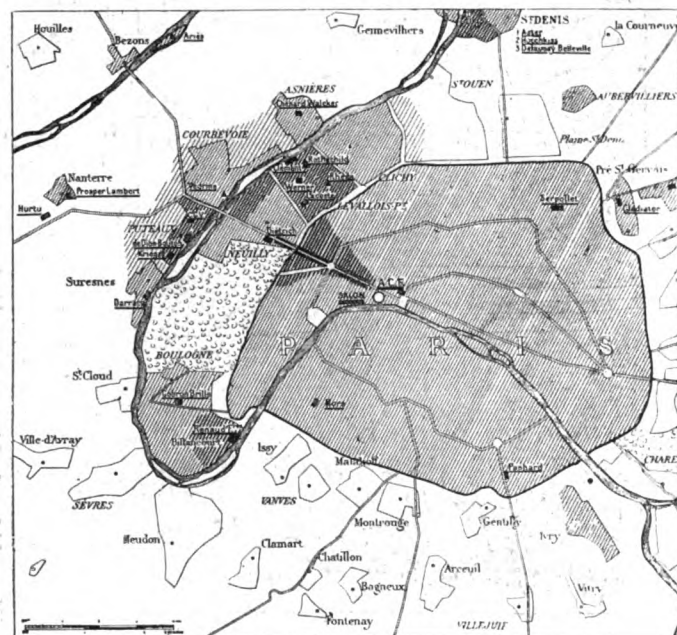

a load proportionate to the cylinder bore, and the test will consist of eight rounds of a 30 kilometre circuit. The position of the competitors at the completion of each lap will be recorded, and the winner will be not the first home, but he whose average in the eight rounds works out the best.

## British Motor-Cabs for Germany.

The municipal authorities of Nuremburg have just granted licences to a local motor agent to run a number of motor-cabs in the town. The service is interesting inasmuch as the vehicles to be used are of British construction, the chassis having been supplied by the Argyll Company.

## The A.C.F. Grand Prix Race.

The A.C.F. committee is still engaged on the question of selecting a suitable course on which to hold the Grand Prix and Commission Sportive races. The original list of about a dozen suggested circuits has been reduced to four, the respective merits of which are now being considered. These are:—(1) the Circuit de l'Aisne (80 kilometres), through Vervins, La Capelle, Guise and Marle; (2) the Circuit de la Seine-Inferieure, through Dieppe, Londinieres, Eu, and Toqueville (81 kilometres); (3) the

A Map of Paris and district, showing the location of the principal Motor-Car Factories.

(Motor Way.)

Circuit de l'Eure (about 86 kilometres), through Evreux, les Quatre-Routes, Conches, Breteuil, and Damville; and (4) Circuit de la Marne (about 83 kilometres), through Chalons, Chaintrix, Bergères-les-Vertus, Fère-Champenoise and Sommesous. So far twenty-two entries have been received for the Grand Prix event.

## Miscellaneous Items.

A twelve-seated shooting brake has been ordered for the Kaiser from the Sud-Deutsche Automobil Fabrik, of Gaggenau. —A company has just been formed in Marseilles to introduce a service of motor-cabs into the town.—The A.C.F. has appointed a special committee to study the best means of adapting motor-cars for the transport of wounded soldiers in time of war.—The "Auto" is organising a trial of motor-bicycles for the coming season. There will be two categories:—1, machines weighing under 55 lb. and in which the motor is an auxiliary, and 2, machines from 55 lb. to 88 lb.—A Darracq-Serpollot steam 'bus was last week put in operation between St. Raphael and Draguignan, in the south of France.—A special committee has been appointed by the French Automobile Club to report on the subject of the skidding of motor vehicles and the steps to be taken to overcome the difficulty.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue that Mr. T. D. Kelly is about to accept the challenge made on May 19th, 1906, on behalf of the six-cylinder Napier car, viz.—that my firm would pay £1,000 to the manufacturer or agent of any four-cylinder standard touring car which can equal the performance of the six-cylinder Napier car as follows:—(1) Flexibility.—30-h.p. six-cylinder Napier (four passengers) ran from Brighton to Edinburgh (including running from 5.32 to over 46 miles per hour) on top speed gear; (2) Petrol consumption.—The same six-cylinder Napier (four passengers) ran 200 miles, and recorded an average consumption of 18.78 miles per gallon of petrol; (3) Running in traffic.—A 40-h.p. six-cylinder Napier (four passengers) ran six hours continuously through London traffic the temperature of radiating water never

A Motor "Cow Catcher."

Mr. J. Ansell has invented a cow-catcher for automobiles. It is V shaped, sloping from top to bottom and projecting beyond the wheels and mudguards. It is made to open like a gate, so that access to the starting handle shall not be prevented, and a person struck by the device would roll off away from the vehicle.

higher than 47 deg. below boiling point. Petrol consumption, 1.84 pints per hour; (4) Gearless.—A gearless six-cylinder Napier (four passengers) ran 1,000 miles, including London to Edinburgh and back, and running from 4.4 to 59.3 miles per hour without slipping clutch. (5) Guarantee.—Three years' guarantee is given with every six-cylinder Napier. (6) Delivery.—£20 a week is paid if six-cylinder Napiers are not delivered to date. (7) £1,000 will be paid to the manufacturer or agent of any four-cylinder standard touring car which can equal the above, and that he wishes to make a match between a four-cylinder car and a six-cylinder Napier on some other points.

If Mr. Kelly can equal the six points mentioned above with a four-cylinder car during the next month, and produce official Automobile Club certificates similar to those awarded to the six-cylinder Napier as shown above, I shall be glad to arrange for a six-cylinder Napier car to meet his four-cylinder car in a competition.

Your readers will no doubt remember that Mr. Wellington has recently been somewhat anxious to challenge the original six-cylinder Napier, both as to its date of origin and as to its capabilities. When his challenge was first made I found a difficulty in getting all the information that was required right away, but I have been to some pains to hunt it up, and if Mr. Wellington is really serious for the match he can have one, both as to the date of the origin of the respective six-cylinder Napier and the Dutch vehicle, and also a match upon the open road or a track, or both, between the original Dutch vehicle and the first six-cylinder Napier, but it must be clearly under-

stood that the loser must lose not less than £1,000 (one thousand pounds), the money to be given to any hospital that the winner may think fit.

My proofs are ready, the car can be produced ready to run, and it now only rests with Mr. Wellington to deposit £1,000 with, say, the Secretary of the Automobile Club, and I will immediately do the same, and the competition shall be held, say, the first week in March.

It is only fair for me to add that the first six-cylinder Napier was rather a powerful engine, and I was mistaken in thinking it was only an 18-h.p.

Perhaps Mr. Wellington would kindly suggest one or two gentlemen who could act as arbitrators in the matter, and if he would kindly communicate direct with me, and not through the newspapers, I should very much prefer it, but I do not want to hear from him until he has deposited this £1,000 as a guarantee of good faith.—Yours truly,

S. F. EDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Edge having sent out a circular respecting his six-cylinder motors, in which he claims that 103 manufacturers are copying the Napier principle, will you allow me to call your attention to the enclosed letter that I have this day addressed to Mr. Edge on this subject?—Yours truly,

FOREST.

Ingenieur-Constructeur.

Alfort (Seine).

S. F. Edge, Esq.

January 21st, 1907.

Sir,—Your circular letter of January 11th has just been communicated to me by a friend. From this circular, which appears to have been sent round to the British and continental press, you make out, and which is most detrimental to me, that you are the first maker to turn out six-cylinder motors, and that your six-cylinder has been copied by 103, and even more, manufacturers—English, French and American.

I think it urgent to inform you that I brought out many six-cylinder motors when you were, perhaps, still a youth. There is now still at work since 1888, at Brest, one of my six-cylinder motors, which I am pleased to say has not once ceased working.—Your truly,

FOREST.

### THROUGH THE SNOW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As experience in the snow is rare among motorists in this country, the story of my recent battle with the snow and ice is not without interest. Many miles away from a railway station, at an old-fashioned gabled hostelry in the Fens of Lincolnshire, we awoke on Boxing Day to find ourselves snowed up. For three days we fought our way through snow drifts, along roads whose usual demarcations were hidden beneath many inches of snow, and thrice the car, Mr. W. E. Lord's 16-20-h.p. Argyll, had to be dug out. On one occasion a snow plough came to the rescue. Where the roads were hardened by the frost, we went gliding, sliding, skidding, and waltzing from side to side, as though the wheels had been fitted with skates, and the car was clumsily trying to do the "outside edge." One witty son of the soil cried out to us: "Take the right field, gents, that's softer. It's a ploughed 'un." But we showed a soul above the artistic, and managed to finish the journey to London, though our car had four up, and was heavily laden with luggage. Nowhere in England was the snow worse than in the Fens, and so I think we have cause to congratulate ourselves upon succeeding where so many others seem to have failed.—Yours truly,

HARRY WEYMOUTH.

### THE TOURIST TROPHY RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are glad to see that an engineer of so much importance as Mr. Royce has pointed out how unsatisfactory are the conditions of the above race. One has only to consider the type of 99 out of every 100 of the cars entered to see that, however interesting the race may be as a consumption test, it most certainly has nothing at all to do with touring. It is this which has hitherto kept us from entering a car, as we could never see how the genuine touring qualities of any car could have any effect but that of making a win an utter impossibility.

Petrol consumption appears to be such an extraordinary quality, capable of such freakish results, that the average buyer must feel rather bewildered; for instance, the makers of a well-known six-cylinder car advertise that one of their cars which has been in the hands of a private owner for some time, when carefully tested, gave twenty-two miles on one gallon. Then we see widely advertised that the little runabout 10-12-h.p. Humber is very economical in petrol and is capable of running twenty miles per gallon. Then the private owner of a big six-cylinder informs one that he can only do seven miles on one gallon. Then in the Rolls-Royce catalogue it is stated one of their 20-h.p. cars, on a fifty-five and a half miles run on the London-Oxford road, including Dashwood Hill, did twenty-seven and three-quarter miles to the gallon, carrying four heavy passengers, with a muddy road and heavy rain. If this is possible, why all the trouble about special carburettors, special cars, special expert drivers, to secure a miserable twenty-five miles to the gallon in the Tourist Trophy Race? All these

records mentioned may be absolutely correct, but if so which result is the owner going to secure, and if the little 10-12-h.p. Humber is only going to do twenty miles to the gallon, by what wonderful means is the huge six-cylinder going to do twenty-two miles? It is all so dreadfully bewildering.

Mr. Royce mentions two other interesting points. He states that the six cylinder, as regards silence and absence of vibration, is a great deal superior to the four-cylinder. We do not understand the silence. There are more moving parts on the six-cylinder, and we should consequently anticipate more noise; for instance, would Mr. Royce suggest that any six-cylinder yet on the road is quieter than a first-class Renault, and, if so, we should like to know exactly why. It would be most interesting to hear. With regard to vibration, it is of course obvious that a six-cylinder vertical is better than a four-cylinder vertical when the car is at rest, but the engine running sets up a most uncomfortable and rapid vibration throughout the whole of the car. However, as Mr. Royce is doubtless aware, it is possible to so design a four-cylinder horizontal engine that vibration is practically completely eliminated, and the results obtained in this respect are certainly as perfect as the results which can be obtained in a six-cylinder vertical engine. So far as vibration is concerned, the best four-cylinder horizontal is the equal of any six-cylinder vertical, and so far as noise is concerned we believe that the four-cylinder horizontal is the superior. Ignition troubles are certainly more frequent on the six-cylinder cars than on the four-cylinder cars.—Your truly,

NEW ENGINE COMPANY.

If we somewhat extend the theme of our subject, we see a great change in trades which have been compelled by force of circumstances to practically devote their entire interests to the motor industry. Look, for instance, at the coach-building trade. Whereas some of the progressive members of this trade looked to the motor industry for a portion of their business, many have now gone over to it entirely, becoming competitors, perhaps not in the manufacture of cars, but certainly as regards their sale, with firms long since well established.

And surely there is a note of encouragement to be found in the general strides ahead for the few firms whose business has not so far needed larger premises, giving them confidence in the early realization of their reasonable anticipations.

So far as the motor trader in a comparatively small way is concerned, we know from our experience and business dealings with him during 1906 that he also is making considerable headway. At one time rivalry was very keen between cycle agents in small towns, but the entry into the motor business of some cycle traders has caused a simmering down of local competition, leaving, in some cases, the purely cycle agent, or trader a free and unfettered hand, and giving the new motor trader an entirely new business environment to nurture and develop.

Thus it comes about that by the general creation of a motor trade connection, frequently started by the sale of petrol, the execution of motor tyre repairs, the charging of accumulators, the motor agent is getting an entirely new and highly remunerative business around him.

Going back, however, to the idea of simultaneous progression, [this

Mr. Guy Lewin at the wheel of one of the latest Standard 30-40-h.p. Six-Cylinder Cars.

## EXPANSION OF THE MOTOR INDUSTRY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Notwithstanding the usual alertness and resourcefulness of the motor Press, we have failed to find any comment regarding what seems to us a most interesting and noteworthy fact, viz., the general and simultaneous expansion of firms engaged in the motor industry—we write “simultaneous” because it is the simultaneity of the development which seems to call for some comment.

The motor Press has interestingly referred to, and given us pictorial illustrations of, the expansion of individual firms, pictures of new factories, and so on. We have studied all this material with interest, but in the interesting pictures and data published the important fact that so many firms are making strides in advance at the same time seems to have escaped the notice of our usually versatile and entertaining journalist friends of the motor Press.

For instance, we read of extensions among such well-known firms as the Daimler Company, S. F. Edge, Humber, Sheffield-Simplex, Brown Bros., Friswell, and many others, all stretching their tentacles in order to get a stronger grip of the increasing business that is coming along, yet the “oneness” of this expansion seems to have escaped notice. Were a carefully compiled list prepared of firms now engaged in building new factories, it would show, we think, how prosperous the motor trade is at the present time, in spite of friendly but keen competition from abroad. We are happy to say that we also have been compelled to extend in order to cope with the growing demand for our appliances, a demand which has necessitated the entire reorganisation of our business departments.

seems to us a most encouraging sign, indicating an advance in motor-business with something like military precision and uniformity, albeit without “command” but through the sheer stress of demand.

If we are not mistaken, this general advance points to a fine prosperous future for many motor firms. A new avenue of trade is also opened up for the cycle agent or trader who is making a bid for motor business, while leaving the purely cycle agent with a wider business environment, and an easier, because less competitive, business for him to carry on.

We firmly believe that were this subject of simultaneous expansion fully dealt with in the motor Press, and reliable statistics given of the extent of progression in each case, it would be extremely helpful to many small agents and traders in the country, now wishful of making a plunge into the motor business, but nervous of so doing lest the result should not turn out satisfactory. As a note of encouragement and help, nothing would be more acceptable than a few sound and timely criticisms from the motor Press on this subject.—Yours truly,

H. HARVEY FROST.

## OBSTRUCTION OF MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Willful obstruction of motorists by drivers of vans and other heavy vehicles has become so prevalent that the Automobile Association feel it is high time they should take steps to let it be understood that the motorist has rights on the highway which must be respected. Accordingly they instructed their counsel, Lord Russell, to prosecute in

a flagrant case of obstruction, with the result that the driver of an open wagon, who twice prevented a member of the Automobile Association from passing him by deliberately drawing his horse to the right, was sent to prison for seven days in default of paying the fine of 20s. and costs. It is hoped that obstructive van drivers will take warning in time, as the Automobile Association had far rather that such persons should abstain from their illegal practices than that intervention should become necessary. The Association, however, are fully determined to prosecute whenever such a course appears to them to be advisable. In the interests of van drivers who have been accustomed to annoy motorists, I trust that a very wide circulation will be given to the Automobile Association's determination, and therefore it is that I venture to encroach on your valuable space in this connection.—Yours truly,

W. J. BOSWORTH, Colonel,  
Chairman Automobile Association.

### ANOTHER IGNITION QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. C. Maw's letter in the *M.C.J.* of the 12th inst., the idea of fitting a supplementary high tension ignition to his car is, I believe, perfectly feasible, and should give good results. Although you say it would be useless if one spark occurred a fraction of a second after the other, my experience with a four-cylinder engine, fitted with both high tension magneto and accumulator ignition, each having its own set of plugs, is that if the battery was switched on when the engine was running on the magneto, a considerable increase of power was noticeable, and to my certain knowledge, the timing of the magneto was in advance of the coil, which proves that although the spark from the coil occurs after that at the magneto plug, yet it increases the power. Of course it would do the engine no harm. I should imagine that a six-volt current would be very like to strain a four-volt coil. I append a rough diagram of the connections which would ensure

the sparks occurring simultaneously. I have wired up an engine according to this diagram, and both the plugs sparked well. The "C" terminals might be connected by brass or copper rods, and a terminal made in the centre of each.—Yours truly,

E. T. WRIGHT.

### THE USE OF THE HORN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of much unpleasantness, not to mention accidents, which of late have happened in connection with motoring, especially in country districts, where men and horses are unaccustomed to these vehicles, it is a public duty to discover, if possible, a remedy, the introduction of which would induce people to assume a less hostile attitude to what they consider (and very often justly) a nuisance. Nothing can be more emblematic of the tendency of modern times than the motor-car; with it we readily associate all the discordant noises, the hurry and rush of modern life, together with an apparent want of sympathy and courtesy.

Now this apparent rudeness on the part of the motorists is seldom intentional, but may in great part be laid to the account of the motor-hooter; howbeit the inclination of man is always to regard anything causing fright and annoyance in a personified way, and thus the feeling of resentment is easily transferred to the occupants of the car. Indeed, the very sound of the motor hooter—aggressive and suggesting the bellowing of a bull—arouses a feeling of opposition.

The remedy, then, for this evil would consist in an abolition or modification of the horn or hooter. A suggestion is offered us by a comparison of the ways in which the old stage coach and the modern motor herald their approach. Now it is a well-known fact, which the old coaching days did not fail to recognise, that all horses love to hear a horn. Anyone who has the least acquaintance with horses, and especially with hunters, knows that the sound of a hunting horn instils new life and spirit into them. In other words, horses hate discordant sounds quite as much, if not more, than some men.

My suggestion, then, is that a knowledge of this fact should be utilised by the motorist, and that such a horn be affixed to the motor

instead of the present hooter, or, failing that, some other instrument giving forth a more musical sound than the hideous noise which frightens both man and beast. Or, indeed, among those motorists who could afford it, a most pleasing and popular innovation would be the installation of a special personage for blowing the horn, after the manner of people driving a tandem. This latter method would, perhaps, be more expensive, but my former suggestion of affixing a more musical horn would incur no appreciable extra expense. If such a horn could be universally adopted, it could not but very materially diminish the number of accidents, and would, in addition, secure a welcome to all motorists everywhere.—Yours truly,

ERNEST DAVIES.

### THE BROOKLANDS RACING TRACK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I do not think there is likely to be any dearth of support from the trade for the new Brooklands motor track. I believe there is enough of the true sporting spirit in it to ensure that; but, even if there were not, the fear of one maker reaping an advantage over others by the advertisement some startling performance would give them would ensure a very large entry for the events.

The public point of view is, I think, another thing; doubtless at first it will draw crowds, but it may soon lose interest, as I foresee too little variation in the running of modern cars to provide much element of uncertainty after the first few laps. Of course, short distance races will obviate that, and this is a point which might very well be borne in mind. It will doubtless be argued that track races are not tests of what a car will do under the different conditions of road driving, and that, in consequence, the buying public will not attach much importance to results obtained on this track, but I think this will prove to be a very erroneous idea. We have only to go back a few years to find that at that time cycle races made all the difference in the world to the sale of machines, and as so many motor-car makers have graduated from the cycle trade they will doubtless remember this and act accordingly. As long as the public interest can be kept up in motor racing so long will the winning of the races help the sales of the successful cars. Fortunately the thing which has killed the public interest in cycle racing is not likely to crop up with motors—loafing—as there would be no object in it with mechanical propulsion.

I daresay the speeds accomplished will give our friends the Highway Protection League something to waste more printers' ink about, as they will probably quote the figures and conveniently forget to state that it was done on a track.

Finally, I think it will benefit all motorists by providing a place where those speed enthusiasts who must have a "dust up" occasionally can go to let off steam, after which they will be able to drive at a reasonable speed in other places.—Yours truly,

W. W. WEBBER.

### A WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to write to you in the hope that this letter, if published, may meet the eyes of the occupants of the large car which passed up through Plympton (near Plymouth) on the night of Saturday, January 19th.

This car rounded the bend in the level road to the bridge by the church at an excessive speed, and, closely hugging the wrong side of the road, bore straight down on the horses of myself and friend, which were being ridden at a walk towards the car.

We both shouted as loudly as possible, and at the very last moment it made a sudden swerve towards its proper side, thus barely escaping our horses, which we had fortunately been able to press into the hedge. We were then returning home from a long day, so that neither of our mounts were as fresh or as spirited as they might have been; but, had this not been the case, I fail to see how we could have avoided a fatality, as, on closely examining the road, which is lighted just here by a gas lamp, we found that the wheels of the car had passed within inches of the narrow strip of mud-sweepings at the hedge-side on its right hand. The time was exactly 6.25 p.m.—Yours truly,

W. GILBERT POPPLESTONE.

### SPEED INDICATORS AND OTHER OPERATING MECHANISM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter signed "Brown," on the above subject, which appeared in the *M.C.J.* of the 24th ult., is one that merits the consideration of all manufacturers of speed indicators. It undoubtedly is a fact that the provision of more or less exposed gears, star wheels, strikers, &c., at so vulnerable a point as the neighbourhood of the steering pivots of front-wheel hubs is productive of more or less damage that cannot be avoided by good construction or careful operation. If some less exposed point of attachment for these devices could be utilised, their action would be rendered more reliable, and I would suggest that a suitable place would be on some portion of the transmission mechanism. The rotation of the differential shaft in a side-chain driven vehicle, or of the cardan shaft in a live axle machine, always bears a definite relation to the speed of the rear road wheels. The same usually holds good of

one or more of the shafts within the gear-box, so there evidently are several points from which an indicating device can be driven at a rate bearing an exact relation to the rear-wheel speed. The only ground for exception to this idea might be based upon some theory that there is more slip between the rear wheels and the road, due to the action of the propelling mechanism, than is the case with the front wheels. Against this, however, is the fact that even the front wheels are subject to more or less slip, making it possible to secure the best results only by gearing in accordance with averages obtained by counting the revolutions in going a given distance, rather than based arbitrarily upon wheel or tire sizes. By following the same plan of observing the actual rear-wheel revolutions during a test, and gearing in accordance with the result, a speed indicator attached as suggested should give readings fully as correct as those obtained by the present methods.—Yours truly,

J. TAYLOR.

## NON-FREEZING ENGINE COOLING SOLUTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR.—In connection with "New Brompton's" enquiry in a recent issue of the *M.C.J.*, there are several kinds of anti-freezing mixtures in general use, and all of them give more or less satisfaction. From the standpoint of cooling efficiency alone, no anti-freezing solution is as good as water. A solution of calcium chloride in water, the proportions being governed by the temperature likely to be encountered, is much approved, and does very well with copper tanks and radiators. It has, however, a markedly corrosive effect on galvanized iron tanks, making it unsuitable for use in cooling systems in which this material is employed. To maintain the car in good condition while using this solution, all losses

from evaporation should be made up by the addition of pure water, while losses through leakage should be made up by the addition of fresh solution. Glycerine and water in various proportions is very good, but will not stand as low temperatures as the calcium chloride solution unless the proportion of glycerine is so considerable as to make the mixture too thick to flow freely. Also, the glycerine exercises a destructive action upon rubber connections in the piping work. Alcohol and water—from 25 to 50 per cent. alcohol—constitutes one of the best anti-freezing solutions that can be had, and the only thing that has prevented it from coming into more extensive use has been its cost and ignorance of its advantages. It loses rapidly by evaporation, requiring more or less frequent replacement unless the cooling system is almost hermetically sealed.—Yours truly,

W. C. COUSENS.

INSPECTION PITS.—"Rotherham" writes:—"Being about to build an inspection pit in connection with my motor stable. I should be glad if any reader of the *M.C.J.* will give me the most suitable dimensions."

A PARAFFIN CARBURETTOR.—Replying to several correspondents, the address of the makers of the B. W. paraffin carburettor referred to in our Correspondence columns last week is the B. W. Start Cold Paraffin Carburettor Company, 9, Southampton Street, Holborn, London, W.C.

SIX-CYLINDER CARS.—The Daimler Motor Company write:—"It having been freely rumoured that we are constructing a six-cylinder car, we venture to trespass upon your columns in order to state positively that we never have, and are not making any vehicles of this description."

NUT FOUND.—On Saturday last a motorcar was travelling between Kingston Bridge and Hampton Court and dropped the large nut that screws into the hub of the wheel. The owner can have the same on giving the name of his car to Mr. F. C. White, 27, Fife Road, Kingston.

## THE BIRMINGHAM MOTOR SHOW.

ON Friday of last week the Midland Motor Show was opened at the Bingley Hall, Birmingham, by the Lord Mayor of the city, Mr. Hamilton Barnsley being in the chair at the opening ceremony, supported by many leading public men of the Midlands as well as by well-known motorists.

The Lord Mayor, in declaring the exhibition open, observed that engineering was one of the most important industries of Birmingham, and it should have been the seat of the motor industry. He thought in looking round the show they would agree with him that England had taken the lesson of their friends across the water very well to heart. The man of moderate means and the man who wanted a luxurious car need not go out of England to be satisfied. He thought all would agree that for excellence of workmanship, stability, beauty of finish, and reliability the English cars stood in the front rank.

On the motion of Mr. Ernest Wynn, seconded by Alderman Edwards, a vote of thanks was passed to the Lord Mayor. Mr. Wynn observed that the British makers had made remarkable progress in motor-car building, and the foreigners had to be very careful what they were doing. With acknowledgments to the chairman the ceremony terminated, and the company proceeded to an inspection of the exhibits.

One of the great attractions of the show is the 40-h.p. Hispano-Suiza chassis, seen on the stand of Barnett Motors, Ltd., Birmingham, this being the first time a Spanish-built car has been exhibited in this country. We described the vehicle in our report of the recent Paris Salon, but it may be mentioned the engine has the four cylinders cast in pairs, and that the crank-case and gear-box are joined together so as to form a single block. The transmission is by a cardan shaft to a live axle, which is provided with a triangular-shaped torsion rod and two side radius rods. There are other points of interest in the new car which

Fig. 1.—Chassis of Weigel 40-h.p. Car.

render it well worthy close inspection. In addition to the Spanish vehicle, Barnett Motors, Ltd., are showing a number of Germain, Renault, Gregoire, and Prunel cars. Great interest is centred in the chassis of the 40-h.p. Weigel car, which makes its first appearance at an exhibition. The vehicle (Fig. 1) is fitted with a four-cylinder engine, the bore being 130 mm. and the stroke 140 mm. A special type of automatic carburettor furnishes the mixture, and the ignition is by low-tension magneto. The transmission is through a disc clutch, cardan shaft and bevel gear to a well-supported live axle. Throughout the car bears evidence of being the result of careful thought. The new Westlake car, shown by Mr. H. B. Lyon, of Taplow, for the first time, is another notable exhibit. The vehicle, which is being made by the Westlake Motor Syndicate, Ltd., has been designed with the object of furnishing a low-powered six-cylinder light car at a moderate price. The vehicle on view comprises a six-cylinder air-cooled engine, rated at 24-h.p., and having automatic inlet valves and coil and accumulator ignition. The piston rods of the six-cylinder are connected up to a two-throw crank shaft. The transmission is by an epicyclic gear giving two forward speeds and a reverse, and a single chain. A 24-h.p. car on similar lines, but fitted with a water-cooled engine, is also being made.

The Pytchley Autocar Company, Ltd., Northampton, have a large stand on which are displayed a range of Fiat and Argyll cars. The former include a 14-16-h.p. double phaeton, an 18-24-h.p. side-entrance car, and a 30-40-h.p. four-cylinder chassis. Of the Argylls, specimens of both the 10-12-h.p. double-cylinder and 14-16-h.p. four-cylinder are shown. The Austin cars on view comprise a chassis of the 18-24-h.p. live axle type, a 25-30-h.p. chain-driven double phaeton, and a 25-30-h.p. live axle car with Longbridge limousine body. One of the largest stands is that of the Newey Motor Company, Birmingham, who exhibit a range of Wolley-Siddeley, Star, De Dion, and Newey-Aster cars, the latter including 20-22-h.p. and 24-30-h.p. models. Mr. F. W. Baker, of Spourbridge, occupies a good position with a couple of Napier

six-cylinder cars, 40-h.p. and 60-h.p., as well as examples of the Belsize 60-h.p. six-cylinder and 20-h.p. four-cylinder cars. The Humber exhibit is a noteworthy one, consisting of three 30-h.p. Beeston-Humber cars, one of which is fitted with a handsome double landaulet body and another with a limousine; two 15-h.p. Coventry-built cars, one fitted up as a double phaeton and the other as a landaulet, as also two examples of the 10-12 h.p. type. The exhibit of the Premier Motor Company, Birmingham, is of a varied character, including as it does a 30-h.p. Marchard, a 10-12-h.p. Premier, a 30-h.p. Humber, a 9-h.p. twin-cylinder Riley, and a 12-h.p. car of the same make with a four-cylinder V type engine.

Messrs. Lowe and Wood, Birmingham, the Midland agents for the Spyker cars, display a series of these well-known vehicles, ranging from 10-15-h.p. to 40-h.p. The Peugeot cars are to be found on the stand of Messrs. C. Healey and Sons, Ltd., Gloucester. Two cars are shown, both of 10-12-h.p., one being fitted with a double phaeton and the other with a landaulet of Messrs. Healey's construction. The Heron Motor Company, Ltd., Birmingham, in addition to examples of the 15-h.p. and 22-h.p. West cars, stage a range of the latest types of Singer cars, including the 9-h.p., 10-h.p. and 14-h.p. models. The Standard Motor Co., Ltd., Coventry, are present with a 30-h.p. six-cylinder Standard car, fitted with a handsome seven-seated phaeton body by Messrs. J. Shepherd and Co., Birmingham. The exhibit of the Birmingham Garage includes two excellent specimens of the well-known 28-36-h.p. Daimler vehicles, and also examples of the 10-12-h.p. and 18-22-h.p. Leader cars, both having four-cylinder engines. A chassis and a double-phaeton of the latest type of 12-15-h.p. Arrol-Johnston car is staged by Messrs. Jarvis, Millership and Co., Birmingham. Heath's Garage show the Darracq, Minerva, and Clement-Talbot, the latter including examples of the 15 h.p. and 20-24-h.p. models. The Woodstock-

Fig. 2.—The Mullett Convertible Body, on a 28-36 h.p. Daimler Chassis.

Manufacturing Company are present with a 12-14-h.p. Clyde car, a 7-8-h.p. Swift, a 9-10-h.p. of the same make, and a 24-h.p. Gracile landaulet. Other cars on view include a 9-h.p. Airex side-entrance double-phaeton shown by the Rex Motor Manufacturing Company, the 14-h.p. Quadrant with Lloyd's cross-roller change-speed gear, the Martini, Bell, Alldays, the 20-h.p. four-cylinder and 28-h.p. six-cylinder Lanchesters, and the Mercedes "mixte" and electrical vehicles. A new two-cycle engine designed for use on motor-cycles is attracting attention at the stand of the Broadway and Croft Motor Co., Birmingham.

As regards carriage work, the principal exhibit of interest is that of Messrs. Mullett and Co., of Bristol, who show a 28-36-h.p. Daimler chassis, fitted with their "All Weathers Quick Change" body (Fig. 2), a novel design which can be used in six different ways, viz., (1) as an open carriage, (2) with the front and half-rear seats enclosed, (3) canopy in position, but otherwise open car, (4) front seats open, rear seats enclosed, (5) front seat covered, rear seats open, and (6) all seats enclosed. The design is undoubtedly an ingenious one, as it would seem that no variation in the weather could find the driver without a suitable combination of windows and roofs to meet the emergency. Some excellent specimens of body work are also displayed by Messrs. McNaught and Co., Worcester, whose exhibit comprises a limousine mounted on a Belsize chassis and a double landaulet.

In the heavy vehicle section Messrs. Wood and Company, Birmingham, are showing a five-ton St. Pancras steam wagon, Mr. C. L. Wells, of Kingwinford, one of the five-ton Sentinel wagons of Messrs. Alley and MacLellan, and Manns Patent Steam Cart and Wagon Company, Ltd., a five-ton lorry.

In the accessory department Muntz's Metal Company, Ltd., of French Walls, Birmingham, have a fine display of aluminium castings, which is well worth the attention of trade visitors. A novelty is seen at the stand of Messrs. Seymour, Humphreys and Co., Birmingham, in

the Certus emergency brake, which consists of a set of four slippers operated by a single lever. Should the brakes fail in going downhill the idea is that one pair of the slippers can be thrown under both rear wheels, whilst should the vehicle start to run backwards the other pair can be thrown under the front wheels. A new glass screen for motor-cars is exhibited by Messrs. R. Disturnal and Co., Wednesbury. It is known as the Ideal, and is made in two parts, so arranged that the upper one can be set at any desired angle. An exceedingly wide range of accessories is shown by Mr. J. A. Riley, Birmingham, including among other things the Gibson power indicator, the Henriche high-tension magneto, Amac distributors, Southall's tyre gauge, Sthenos carburettors, &c. Several useful motor houses are displayed by Harrison Smith Buildings, Ltd., Birmingham. A safety filler for transferring petrol from tins to reservoirs without waste or danger forms the exhibit of Pettett's Patent Safety Filler Company, Brighton, while Messrs. F. S. Nickells and Co., of Blackheath, are present with a display of their instantaneous connectors for tyre inflators and a new pump with self-registering pressure gauge. Ignition batteries form the speciality of the Premier Accumulator Company, Northampton. Messrs. S. Smith and Sons, London, have on view an interesting display of their speed and mileage indicators. The Auto-adjustable box spanner recently illustrated in the *M.C.J.* is displayed by Messrs. Avery and Roberts, Ltd., Liverpool, while the Valor Co., Ltd., Aston Cross, draw attention to their fire extinguishers. The exhibitors of motor tyres include the Clincher, Continental, Dunlop, and Michelin. Considerable interest is also being displayed in the specimens of Elastex filled tyres to be seen on the stand of the Elastex Co., Ltd. The Shaw Motor Tyre Tread Company show their non-skids and tyre tester as well as the Stepney spare wheel. The Roberts tyre gauge is exhibited on several stands, while other non-skids on view include the Parsons, the Desclee, the Economy of Mr. W. S. Cort, Market Harborough, and the Rub Metal of the New Motor and General Rubber Company, London. The Show closes to-day (Saturday).

## ROAD REPORTS.

**SURBITON.**—Mainly in consequence of the difficulty and expense in adequately watering the Portsmouth road and other highways in Surbiton, that are much used by motor-cars in the summer, the Surbiton District Council has debated a proposal that a motor water-van should be purchased at an estimated cost of £800, which, it is believed would do the work of nearly four of the horsed water-carts at present in use. The proposal was favourably received, but as there was an inclination to introduce motor-haulage into other departments of the council's work, the consideration of the question was deferred pending a further report.

**BUCKINGHAMSHIRE.**—The London and Bath road, according to the report for the past year of Mr. R. J. Thomas, county surveyor for Buckinghamshire, is probably the most used by light motor-cars in the kingdom. During the year there has been an increase in road maintenance in the county of nearly £1,200, and the main cause for this is stated to be the increase in the number of heavy traction engines, as well as the motor-car traffic, combined with the bad season. A coating of granite now lasts only twelve months, whereas it had at least three years' life. In several cases tarmac has been used with satisfactory results.

## SUBSTITUTES FOR PETROL.

In thanking the *M.C.J.* for the assistance already rendered to the Fuels Committee of the Motor Union by giving publicity to their proceedings in our columns, the committee ask us to give prominence to the two questions below, inviting those of our readers who are in possession of the information therein asked for to communicate with Mr. Rees Jeffreys, the secretary.

The committee are aware that many private owners of cars have made experiments with various fuels and substitutes for petrol, and it is very desirable that the results of those experiments should be collected, collated, and included in the very full report dealing with the fuel question which the Motor Union is preparing.

**QUESTION 1.**—What do you know of the use of the following substitutes for ordinary petrol:—(1) Heavy mineral spirits distilling between 50 deg. C. and 190 deg. C. (2) Tar spirits, including benzol, benzene, and coal-tar naphtha. (3) Alcohol.

With special reference to the following points:—(1) Cost. (2) Convenience of supply for touring purposes. (3) Efficiency as a fuel for internal or external combustion. (By efficiency is meant the quantity necessary to develop a given power as compared with petrol.) (4) Smell, both in the burnt and unburnt state. (This includes the question of general cleanliness in using, and the impregnation of the upholstery of the car and the clothes of the driver, &c.) (5) Cleanliness in use so far as smoke and deposit in the cylinders are concerned. (6) Corrosion of cylinder by acid products of combustion?

**QUESTION 2.**—Can you make any suggestions on the following or any other points designed to reduce the cost of distribution:—(a) units of supply; (b) packing; (c) transit; (d) insurance; (e) legal restrictions?

## ACCESSIBILITY AND CLEANLINESS.\*

By F. L. MARTINEAU.

In preparing a paper on this subject I have endeavoured to show the ideal to be aimed at, and to indicate how this ideal may, in some degree, be attained. I have tried to consider each item from the standpoint both of the vertical and horizontal engined car; my difficulty usually has been that the horizontal type can be made so much more accessible in almost every detail that my remarks generally apply to that type. As regards the two points in the title "Accessibility and Cleanliness," they are so intimately connected the one with the other that I have had to consider them together. To begin with the ideal of cleanliness, it is, I think, that the whole exterior of the car should be smooth and easy to clean; that no mud or dust should be able to be thrown by the wheels on to any part of the mechanism, on to the steps or the carriage body; that all working parts should be thoroughly protected from grit; and that all oil drippings from the engine and gear should be caught and retained in a detachable receptacle easy to remove and clean out.

The great question on which the whole problem of accessibility hinges is this:—Why is it needful to be able to get at any parts of the mechanism? If it were not, the matter of cleanliness would be an easy one, as one could seal the whole mechanism up like sardines in oil and let it look after itself and yet always keep the exterior spick and span. Under these circumstances it would necessitate the designer so proportioning the various parts of the car that nothing ever wanted adjusting or replacing, and the end of the car would be like that of the one-horse shay, which collapsed into nothingness after its period of life was fulfilled. Unfortunately, it is impossible so to foresee the varied conditions of working and the attention, or, rather, lack of it, bestowed upon motor-cars by those responsible for the running of them, nor is it possible to provide absolutely against accidental breakages. This being so, it may be necessary to remove or adjust any part, and so, to obtain the ideal of accessibility, we may lay it down as an axiom "that we ought to be able to remove any one part without disturbing any other." This ideal is practically impossible of attainment; to approach within reasonable distance of it would necessitate every part being exposed and in view, which would prevent us obtaining efficient means of protection, and jeopardise our ideal of cleanliness. The best we can do, therefore, is to study the easy removal of those parts liable to wear.

The first thing to consider, therefore, is the general scheme of the whole car, and in this the body which is to be used is the item of greatest importance. What is the use of having an engine nicely housed in a bonnet in front, easily opened and inspected, if the gear-box and other vital parts are covered up and made inaccessible by the carriage body? The latter, undoubtedly, should be capable of being easily raised or moved so that all running gear can be efficiently inspected. The position of the carriage body depends principally upon the permissible wheel base. What is the maximum wheel base which is easily handled and utilised in all districts? I have come to the conclusion that 9ft. is the maximum. Having the size of a suitable carriage body, we can ascertain the amount of available space for engine, &c. Take a landaulet body, the type most in vogue; this to be really comfortable must have a total length from dash to back of 108 in., which, it will be noticed, is the same as the wheel base. As it should not project behind the centre of the rear wheels to give absolute comfort to the passengers on the back seats, the dash will come level with the centre of the front wheels. This does not give enough room for an engine of the ordinary accepted vertical type in a bonnet in front; it is thus imperative to adopt some other position for the motor or curtail the seating accommodation. If the engine is a vertical one it can be placed in a bonnet between the driver and passenger in front, or it can be arranged under the driver's seat. Another way out of the difficulty is to utilise a horizontal engine, as by so doing an absolutely flat surface is left for the carriage builder to work upon and every part can be made very easily accessible.

To render every part accessible the body can be made to rise on hinges at the back. To inspect the engine and gear-box separately the front and back floor boards can be removed, the former for the motor and the latter for the gear. I am making them to slide out of the way under the seats and yet arranging them so that they lift up with the body. These few remarks indicate how the latter may be made so as to minimise its interference with the accessibility of any part. As a general practice, it may be laid down that the whole of the chassis should be erected and every part should be accessible from above. With a car so designed a pit is no longer a necessity, and the most perfect cleanliness can be arranged for, as the undershield can be made absolutely continuous and permanent.

There are certain items which at first sight appear to have no part in the making of accessibility, but in reality do so. One of these is the method employed of locking nuts, and another is their size and position. Dealing with the latter point first, it should not be necessary to use special spanners for any nuts. They should be arranged so that they can be got at either with an ordinary tubular box spanner or an ordinary flat one. Personally, I favour making all possible nuts to be done up with a tubular box spanner, as this tends to lessen the weight by curtailing the size of boss necessary, and also, by preventing damage to the nuts, makes them easier to handle after much use.

\* Extract of paper read before the Institution of Automobile Engineers on January 16th.

The number of sizes of nuts used in a car should be reduced to a minimum. I am now using only five sizes on the whole car, which means that the total number of spanners necessary to undo any nut is greatly reduced. To deal with the nuts requires only three tubular box spanners, two double-ended and one single-ended, and three ordinary flat spanners, two double-ended and one single. It would be a good work if the Institution were to go into the matter with a view to the reduction in the number of sizes of hexagon nuts used. Of the spanners I have mentioned as necessary for my car, that for the jet is the smallest, and this is now being made to fit all nuts on the ignition parts. All screws on the carburettor, &c., are also being made with hexagon heads to fit this spanner as well as a screwdriver slot.

As regards the method employed of locking nuts I divide the bolts up under two heads, namely:—(1) Those used for construction, which seldom or never require removing. (2) Those which require removing to make adjustments or for cleaning. For No. 1, as a general rule, I prefer to use Castle nuts with spring washers under, and for No. 2 ordinary nuts and spring washers. A Castle nut, in my opinion, should never be used without a spring washer, as it requires such care in tightening so as to fit the cotter, if it is to be done without either straining the bolt or leaving it too loose.

(To be concluded.)

## OIL ENGINES FOR AUTOMOBILES\*

By J. D. ROOTS.

THERE have been numerous attempts to produce a satisfactory oil engine for use with an automobile since the first engine made for this purpose by the writer in 1892, which was fitted to a Coventry Machinist's tricycle and propelled by gear wheels, in a similar manner

A short time ago the "Glasgow Evening News" placed an order with the Argyll Company for seven 10-12-h.p. cars, specially designed for the conveyance of newspapers. The first of the vehicles, of which we give an illustration above, has just been put in operation. The body has been constructed with a view to carrying a big load of newspapers, and has a canvas cover for use in wet weather.

to that afterwards employed so successfully by De Dion and Bouton in their motor-tricycle, the only difference being that in the Roots tricycle bevel wheels were used, whereas De Dion used ordinary spur pinions. This Roots engine was a two-stroke-cycle engine, and the vaporiser was on the same system or principle as was afterwards successfully employed in the car engines.

The engine made by the writer for automobile purposes in 1893 and 1894, and exhibited at the Stanley Show, was a four-stroke engine, and showed considerable advance in the method of oil feeding and in vaporisation. But both these vaporisers were badly throttled, and the oil feed was variable. In both these engines, also, no attempt was made to control by a governor, and a form of throttle to control the speed of the engine was fitted to vary the air inlet on a similar method to that subsequently employed so successfully on petrol motors.

To design a successful oil engine for automobiles, it is not the vaporiser only that has to be considered, but the method of oil feed, and the latter is of equal importance with the former.

Many of the attempts which have been made to make an automobile oil engine have been based on the idea that the method of feed is of no more importance than it is in a petrol engine, and that the fuel feed which is good enough for the one engine is necessarily good enough for the other. In the spray carburettor, in spite of all attempts to improve this

\* From a memorandum prepared for the Fuels Committee of the Motor Union.

type of fuel feed by additional devices to control the air supply, automatic and otherwise, there will, and must necessarily be, a considerable variation in the feed. This variation will occur not only for those working strokes in which the volume of air drawn in is reduced or varied by the throttle, but also in those working strokes in which the air supply is unrestrained and the maximum volume of air is drawn in every working stroke. The very nature of the jet nozzle fuel feed, in which a spray is induced by suction, is indeterminate and other than positive.

In a petrol engine a little more or less fuel than the volume of air which is permitted to enter the cylinder will be more or less effectively utilised; a mixture slightly too strong or slightly too weak does not produce a misfire, and if the mixture should be too "rich in petrol" to fire or too weak to fire, no great harm is done, because, if a little smell of petrol be made, there is generally nothing perceptible to the eye, as usually no smoke is made from this cause.

A rather greater variation of feed above and below the best mixture for complete combustion is possible with petrol than with oil, and a rather greater variation is permissible before the ignition limit is reached, both above and below the best and most ignitable mixture. On the other hand, when the limit of ignition is reached with oil both above and below the best ignition and combustion mixture, and a misfire occurs, smoke is given off, and, if the misfire is repeated a few times, so much smoke is given off as to render that engine impossible.

It is clear, therefore, that a successful engine for automobiles must necessarily have a positive and mechanical fuel feed, one that delivers an accurately measured feed of oil to the engine for every working stroke. It is also clear from the foregoing that the petrol spray or nozzle jet feed carburettor cannot be of use for supplying the oil fuel to a paraffin engine. A large majority of the attempts to use oil as the fuel for automobiles has been by either the application of heat to some form of jet-spray carburettor, or by the supply of heated air to such a carburettor. All attempts to produce a successful oil engine for automobiles by a jet spray or by any other than a device having a positive, and therefore a mechanical, fuel feed are foredoomed to failure.

## CASES UNDER THE MOTOR-CAR ACT.

### THE JURISDICTION OF POLICE MAGISTRATES IN SCOTLAND.

A point of great importance to automobilists has occupied the attention of a full bench of judges in the Scottish Justiciary Appeal Court. The complainant was David Macpherson, chauffeur, 38, East Argyle Street, Helensburgh, who was charged at the instance of the Procurator Fiscal of Ayr, in the Ayr Police Court, with having in May last driven a motor-car at 22½ miles an hour, contrary to the Motor Car Act, 1903. Bailie Morton fined complainant £3. The conviction was objected to on the ground that the magistrate in the police court had no jurisdiction to try the complaint, in respect that the contravention charged was a statutory offence created for the first time by the Motor Car Act, which conferred no jurisdiction on the magistrates of police burghs, but, indeed, excluded them. The point was raised at the last sitting of the Justiciary Appeal Court, but the Lord Justice-Clerk considered it too important to be decided by a small bench. After hearing counsel, the Lord President said that in cases where it had been wished to confer jurisdiction upon magistrates or justices, it was said so in so many words that the offences would be punishable on conviction before the magistrate or the justice, as the case might be. His Lordship had always understood it to be the law that in the case of statutory offences the jurisdiction must be specially conferred on any courts which had not universal jurisdiction, and the only courts that he knew that had universal jurisdiction in criminal matters were the Sheriff Court and the Court of Justiciary. He was, therefore, of opinion that the conviction could not stand. That opinion was concurred in by all the other judges, and the Court suspended the conviction, with twenty guineas expenses. Mr. G. H. Robb, of Glasgow, the solicitor to the Scottish Automobile Club, had charge of the case, and instructed the counsel who represented that body at the hearing.

### MOTOR CYLINDERS.

A MEETING of the Birmingham Branch of the British Foundrymen's Association was held at the Technical School, Birmingham, on Saturday evening. Mr. Hailstone read an interesting paper on the "Characteristics of Foundry Iron," illustrated by a number of micrographs, showing the proportion of the different elements in large, medium, and small castings made from the various qualities of iron. In the discussion which followed Mr. Hiorns, referring to motor-car castings, said he thought that the high proportion of phosphorus and sulphur shown was very dangerous, and held that it probably accounted for many of the accidents heard of from time to time. When he heard of a motor-car failing, he should be inclined to blame the ironfounder. Mr. Cook also thought the percentage of phosphorus in the composition of some motor cylinders too high, especially when it was a common occurrence with some engines, on a run of fifty miles, for the cylinder to become red-hot. Mr. Barker said that the phosphorus was necessary to make the metal "form," as some cylinders were so thin in their sections; it was a question of design.

## CLUBS AND ASSOCIATIONS.

### THE INSTITUTION OF AUTOMOBILE ENGINEERS.

A COUNCIL meeting of the Institution of Automobile Engineers was held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., on Wednesday of last week, when there were present:—Colonel R. E. Crompton (in the chair), Messrs. Chas. Wheeler, Dugald Clerk, M. O'Gorman, F. W. Lancaster, D. J. Smith, T. C. Pullinger, E. E. Baguley, F. L. Martineau, John S. Napier, Douglas Mackenzie, Douglas Leechman, Alex. Craig, and Rees Jeffreys (secretary). The following were elected members of the Institution:—Mr. W. P. Adams, London; Mr. T. B. Browne, London; Mr. R. W. Buttemer, Godalming; Mr. A. H. Dougill, Leeds; Mr. D. W. Gaw, Harrow; Mr. C. Leveson-Gower, Wolverhampton; Mr. D. H. Hamilton, London; Mr. W. M. Macfarlane, London; Mr. R. G. H. Markham, London; Mr. H. E. Morris, London; Mr. A. H. Niblett, Beeston; Mr. W. Norris, Blackpool; Mr. Ernest Talbot, Bedford; Mr. G. H. Wait, Leicester.

The secretary reported that a letter had been sent to all members inviting contributions to the Foundation Fund, and submitted a report showing that £51 3s. had already been subscribed.

It was reported that Mr. Percy Martin (managing director of the Daimler Motor Company, Ltd.) had promised to read a paper before the Institution on "Works Organisation," on Wednesday, 13th March, 1907.

### A.C.G.B.I.

"APPALLING" was the only word that an official of the A.C.G.B.I. could find to characterise the programme that is in contemplation for this year. It is hoped to hold both the Tourist Trophy Race and the Heavy Touring Car Race in the Isle of Man about the beginning of June. At Blackdown Park, Fernhurst, Sussex, an important meeting will be held on June 8th, when the Henry Edmunds Hill Climbing Challenge Trophy Race will be contested. On or about July 6th the South Harting Hill Climb will take place.

The "A.C. system of handicapping for hill climbing competitions is well on the road to publication and will be issued in booklet form with numerous pages for calculations and memoranda.

Negotiations have just been concluded with the Orient Royal Mail Line for the conveyance of cars at special rates to Marseilles and Naples. Over 2,500 interviews on touring matters were given during last year.

The Club has done a great deal to popularise Algeria as a motoring resort. Some time ago a motorist in Paris wrote to the Club for information about touring in Algeria, as he found it impossible to obtain any useful information in Paris, in spite of the fact that it is a French colony. Full particulars were sent to him, including road maps, route distances, hotels, petrol depots, &c., and he was evidently impressed by the work done, for a little later he wired from Madrid for information about the roads in Spain. As several intending visitors to Algeria have expressed a certain amount of timidity owing to the disturbed state of affairs in Morocco, information has been obtained by the Club from the Foreign Office and through correspondents abroad, with a perfectly reassuring result.

### MANCHESTER MOTOR CLUB.

THE third annual general meeting of the Manchester Motor Club was held in Manchester on Thursday of last week. The report and balance-sheet presented was adopted. The finances of the club are in a sound condition, and a balance of £130 is carried forward. The prizes for the competitions have been added to by the presentation to the club of six challenge trophies. The membership now stands at over 200. A new rule was passed with regard to the club subscriptions, which, in case of car and cycle members, include affiliation to the Motor Union. In future an entry fee will apply to applicants for membership.

The following officials were elected:—President, Mr. F. C. Hunt; vice-presidents, Messrs. Sawley Brown and A. R. Albert; captain, Mr. A. J. Moorhouse; hon. treasurer, Mr. T. Kilfoyle; hon. secretary, Mr. J. Fraser; committee, Messrs. P. H. T. Butler, T. Garner, H. W. Cranham, A. J. Bell, G. Richardson, J. T. Ward, E. J. Lowe, G. Spencer, and R. Fisher.

### THE MOTOR VAN, WAGON AND OMNIBUS USERS' ASSOCIATION.

A MEETING of the executive committee of the Association was held on the 18th inst. There were present:—Colonel R. E. Crompton (in the chair), Mr. S. D. Gilbert, Dr. H. S. Hele-Shaw, Messrs. W. G. Lobjoit, Douglas Mackenzie, J. C. Mitchell, E. Shrapnell Smith, and Rees Jeffreys (secretary).

The report of the sub-committee was received as to the conference of the Automobile Club, the Society of Motor Manufacturers and Traders,

and the Association, and it was resolved that Messrs. W. C. Lobjoit, L. H. Baxendale, and Dr. H. S. Hele-Shaw be the representatives of the Association on the Commercial Vehicle Trials Committee.

A letter was read from the Automobile Club asking the Association to nominate two gentlemen to attend the drawings sub-committee in connection with the motor-omnibus side-slip competition on behalf of the Association, and it was resolved that Mr. Daniel Duff, of the London Road Car Company, Ltd., and Mr. R. Bell, of the London Motor Omnibus Company, Ltd., be appointed.

The question raised by Messrs. Wordie and Co., of Glasgow, as to the arrangements for the periodical inspection of mechanical vehicles by authorised engineers of the Association was considered, and it was resolved to write them saying that such a scheme was contemplated by the Association.

A letter was read from the Metropolitan Water Board stating that the Board's engineer was now constructing a water post for the supply of motor-vehicles, and as soon as the work was far enough advanced, they would write again with a view to its inspection by the Association.

### NORTH LONDON.

THE annual general meeting of the North London A.C. has been held at the headquarters. The following gentlemen were elected on the committee:—Messrs. Graddon, Cannon, Lendrum, Paul, Cutler, and Smith. Mr. A. Hassall was elected chairman and Mr. W. Holmes vice-chairman. Mr. Charles Smith tendered his resignation as hon. secretary, which was accepted with much regret, and a special vote of thanks was passed for his past services. Mr. J. Thomas Barber was unanimously voted his successor. Dr. North, late chairman, was elected a vice-president, and Mr. Swinger one of the auditors.

Motorists in the North of London wishing to join and members having any suggestions with regard to future fixtures should communicate with the hon. secretary, Mr. J. Thomas Barber, Medina, Hardwicke Road, Palmer's Green.

### THE AUTO CYCLE CLUB.

At the Criterion Restaurant, London, on Friday of last week, the Auto Cycle Club held its fourth annual dinner, with Mr. Robert Todd in the chair, supported by the leading motor-cyclists in the country and many car enthusiasts who do not despise the automobile of smaller degree.

The loyal toasts having been honoured with heartiness, Col. H. C. Holden, in proposing the toast of "The Auto Cycle Club," referred to the early efforts of Daimler in connection with the motor-cycle, and said that now that the machine had become so practicable the public would like to become accustomed to a motor-bicycle that made less noise than that with which they were all familiar.

Mr. C. A. Smith, hon. treasurer, responded, and enumerated the many events that had constituted the club's programme during the past year. With reference to the protest they had lodged with regard to the International Cup, he regretted to say that nothing had been heard of the matter since it was lodged. He eulogised Col. Holden's efforts with the motor-bicycle, and congratulated the club on the outlook of the movement for the future.

To Mr. J. W. Orde was entrusted the toast of the affiliated clubs, which he said numbered twenty-two, with close upon 1,000 members. Six other clubs had also decided to enter the combination of clubs, and there were also present representatives of the Motor Cycle Club, the Guildford, Southend, and the Essex clubs. When a club joined the Auto Cycle Club it was really strengthening itself. There was no need to centralise too much, each club should do its own work, and do it thoroughly. They need not put all the work on the central body. It was easy to lose their individuality, and when it was lost interest waned. He reminded them of the motto of the United States as one worthy of adoption.

Mr. W. H. Bishop, of the Essex Motor Club, responded, giving testimony as to the useful work done for the organisation by Mr. F. Straight, the secretary.

Mr. M. O'Gorman proposed the toast of "The Visitors," pointing out that motor-cycling had suffered from insufficiency of capital and possible lack of judgment and want of unanimity. The latter point was now secured—a satisfactory state of things. There was an impression among the public that a man who rode a motor-bicycle received a series of strong kicks as he went along. That was the consequence of the noise. They ought to realise the importance of silence and the education of the public.

Mr. C. Jarrott responded to the toast. He had endeavoured to ride the Daimler machine to which Col. Holden had referred and was not surprised that the inventor had given it up. They had not yet got the right machine. In 1896-98, when motor-cycling commenced, he remembered the fun and amusement they had. The machines of 14-h.p. answered every ordinary purpose. Much of the fun he confessed arose from the fact that the machines went wrong. With the advance in the idea of speed the power of the motors increased bit by bit. Still there was a certain amount of amusement, and he remembered the excitement of the Paris-Bordeaux race of 1899, when Mr. Edge and himself were the only English competitors, riding "monsters" of 24-h.p. Personally he preferred the motor-bicycle to the motor-tricycle. The great future of the motor-cycle was in the direction of a machine which could be used by the ordinary individual. If they aimed at simplification, at reduction of weight and a decreased power of engine, the motor-bicycle would

have ten times as many patrons as now. He hoped well for the sport of motor-cycling and trusted the trade element would not become too powerful in connection therewith. In conclusion, Mr. Jarrott referred to the cups in front of the chairman on which his name was inscribed in 1901.

Messrs. Douglas Miller and S. J. Sewell also responded. The latter, as chairman of the Motor Cycling Club, was glad to announce that his club had decided to affiliate with the Auto Cycle Club, an intimation that elicited hearty applause.

At the conclusion of the speech-making the prizes won by members of the Club during 1906 were presented. These included medals to Messrs. C. R. and H. A. Collier for their performances in the International cup race selection trials, and to Messrs. D. R. Clarke, C. R. Collier, and A. Edmondson in connection with the M.C.J. challenge cup contested on the Canning Town track, and others for other sporting events organised by the club.

### MOTOR CYCLING CLUB.

At the annual general meeting of the Motor-Cycling Club, under the chairmanship of Mr. S. J. Sewell, the following officers were announced for the current year: President, Major-General Sir H. E. Colville; vice-presidents, Messrs. Albert Brown, S. F. Edge, E. Periman, S. J. Sewell, and J. A. Jackson; captain, W. H. Wells; hon. secretary, A. Candler; hon. solicitors, Messrs. E. K. and F. Purchase; hon. auditor, S. H. Pearce; hon. treasurer, R. C. Davis. Committee: Messrs. R. G. Booth, A. Candler, S. G. Frost, L. A. Baddeley, R. G. Davis, W. H. Wells, Dr. C. B. Moss-Blundell, J. Van Hooydonk, R. M. Brice, F. J. Jenkins, E. March, and R. H. Head.

MR. J. D. CRUICKSHANK, 27, Albert Street, Dundee, is endeavouring to start a motor-cycle club for that district.

THE Coventry Motor Club's open gymkhana has been fixed for June 1st; a hill climbing competition will be held on July 20th.

A CLUB which is being formed among the chauffeurs of Edinburgh held its inaugural dinner at the Imperial Hotel, Edinburgh, a few evenings ago.

THE secretary of the Motor Yacht Club is compiling a list of mechanics who are in want of situations on motor-boats.

### COMPANY NEWS.

#### NEW COMPANIES.

ACRE RUBBER COMPANY.—£6,000. To acquire the business carried on at 58, High Street, Bloomsbury, W.C., and 130, Steelhouse Lane Birmingham, as the Acre Rubber Company, &c.

MERCEDES PETROL-ELECTRIC CO., LTD.—This company has been registered with a capital of £1,000, to carry on the business of manufacturers of and dealers in motor-cars, whether propelled by petrol, electricity or other power.

THE STAR CYCLE CO. have issued their report showing a trading profit of £12,116, £5,000 of which is to be carried to the reserve fund.

### AERIAL NAVIGATION.

AN instructive lecture was given by Colonel Marsh at the Mechanics' Institute, Tunbridge Wells, last week, upon the subject of aeroplanes, kites, balloons, &c. The speaker explained the delicate construction of a kite and the many and varied forms of the kite which were in existence. He illustrated his remarks by exhibiting specimens of the different "paper birds" which had been made, and pointed out the marvellous possibilities which might be attained to in their construction, reminding his audience of the value which was already attached to them in military circles. The speaker proceeded to give a definition of aerial motion, and concluded with a reference to the flying machine and other methods of aerial flight.

Further interest in the subject will be created by the aeronautical section of Cordingley's forthcoming Motor-car Exhibition at the Agricultural Hall, London.

### MOTORIST AND POLICE.

AN interesting case has been heard at Cambridge Assizes, before Mr. Justice Ridley and a special jury. Archibald Canty, a motor tester, sought to recover damages from Inspector Griffen and Police-constable Beecham, of the St. Neots police force, for false imprisonment. Canty was summoned and convicted for driving a motor-car furiously on the Great North Road, to the danger of the public, and fined £10 and ordered to have his licence suspended for three months. He was unable to produce his licence for endorsement, and he alleged that the police kept him in custody until a friend in London, to whom he telephoned, came with the licence. He called witnesses to support his statement, but the police gave it an emphatic denial, and the magistrate's clerk affirmed that he told the plaintiff a fortnight would be allowed. The jury found that there was restraint up to the time of the sending of the telephone message, and awarded the plaintiff 12s. 3d., the cost of message and the railway fare. It then appeared that this did not carry costs or justify a special jury, and judgment was given for the defendants.

### THE HEAVY TOURING CAR RACE.

THE accompanying diagrams give the dimensions of the bodies and of the wind screen which must be fitted on cars entered for the Heavy Touring Car Race, to be held, probably, in the beginning of June.

THE specification of the wind screen is as follows:—The wind screen shall be fitted behind the front seats, not less than six nor more than twelve inches from the back of the seats, and must be securely fixed and stayed. The screen shall be windproof, vertical and flat, and shall be made of 3-ply wood board. The top of the screen shall not be less than 8 ft. from the ground, and the width of the screen shall not be less than 5 ft 3 in. Two holes may be cut in the screen for sight holes, but these holes shall not be more than 6 in. in diameter, and must be filled in with glass not less than  $\frac{1}{8}$  in. thick, securely fixed. An entrant may enter a car with a covered body, but in this case the cross-section offered to the wind shall not be less than that presented by the wind screen above mentioned. If the wind screen or any part of it becomes

Diagrams showing Minimum Body and Wind-screen Dimensions for Vehicles in the Heavy Touring Car Race.

displaced during the race the car will be liable to disqualification. The specifications of the fuel tanks are the same as those for the Tourist Trophy reproduced on page 1,039 of our last issue.

### PUBLIC MOTOR SERVICES.

THE eight Chelmsford steam omnibuses that have been in successful service at Torquay are being transferred to a Harrogate company, of which the Lord Mayor of Leeds is chairman.

ON Sunday a motor-omnibus belonging to the London General Omnibus Company ran into the Thames at Barnes. About a quarter past eight the vehicle was travelling along the Terrace at about eight miles an hour. When within thirty yards of the journey's end, and at a part of the Terrace where the bank inside the railing slopes at an angle of about thirty degrees to the river, the steering gear is alleged to have broken, and the vehicle slewed from side to side and finally struck the railing. This was carried bodily away and flung down the slope, the bus following. At the time of the impact the brakes had almost brought the vehicle to a standstill, but, happening to get the front wheels on the mud inside the railing, it commenced to slide, and, gathering momentum, glided down the bank and into the water twenty yards below. The driver stuck to his post until the omnibus touched the

water, when the engine was completely submerged. The driver floated off and climbed over the top of the omnibus, where he lay exhausted. The conductor was shot head over heels inside. The two passengers on the top were unhurt. At a late hour at night a traction-engine arrived, and at midnight attempts were made to haul the heavy vehicle back to the roadway, which was successfully done on Monday.

An electrobuss, L.C. 5768, has been assayed by the Metropolitan police authorities, and will shortly be put in service by the London Electrobuss Company.

THE Kintyre Motor Company, Ltd., of which Mr. C. T. Wakeham is the managing director, and which has headquarters in Campbeltown, intends to maintain a motor service for goods and passengers in Argyllshire, and on May 1st a regular system of motor-cars will be commenced. In addition to these services there will be a large garage at Ardrishaig, where there will be a number of cars kept in reserve for the main routes, and for hire. There will also be garages and spare cars at Oban, Inveraray, Arrochar and Campbeltown. These garages will be extremely useful and convenient for owners of private cars. Drivers will also be trained at these garages. Petrol and oils will be kept at all the branches, and also a considerable amount of car furnishings, such as lamps, accumulators, horns, and spares of all kinds. It is also intended to develop the goods carrying trade by motor lorry and delivery vans, and so at each of the stations of the company there will be a car for this purpose, according to the requirements of the district.

### MOTOR CAR ATTACKED BY A HORSE.

A MOTOR CAR belonging to Mr. Chalmers, of Redhill, after conveying Lady Henry Somerset to Duxhurst, was returning when it met with a serious and remarkable accident. A horse attached to a trap bolted from a public-house at Iron's Bottom and galloped along the high road. The animal suddenly came upon the motor before the chauffeur could turn the car to the side of the road. The runaway leapt over the bonnet through the screen on to the hood of the car. The chauffeur, who had a miraculous escape, was pitched into a ditch, but not seriously injured, while the car and trap were smashed to pieces.

### MOTOR-CAR ACCIDENTS.

A SINGULAR accident occurred at Morecambe on Monday to a motor-car, the property of Mr. David Read, cotton manufacturer, of Burnley. The vehicle was being driven on the sea front when it suddenly got out of control, and, dashing across the roadway over the promenade, knocked down the cast-iron railings and leapt down the sea wall. The occupants were pitched out, and the car ran on to the water's edge. One of the passengers, Mrs. Goodall, of Leeds, was badly injured. Her husband and Mr. Read's chauffeur escaped with some bruises and a shaking. The promenade railings were torn away for many yards.

A FATAL motor-car accident occurred at Cheam on Friday night. The vehicle, containing several ladies, was being driven along the London Road, when, owing, it is supposed, to the fog, the car collided with a carriage and a cart going in the opposite direction. A lady named Miss Catherine Taylor, of Streatham, was thrown out, and killed almost instantaneously.

THE story of the fatal motor accident at Cheam was told on Tuesday at the inquest on Catherine Margaret Taylor, of Streatham. The chauffeur admitted that though there was a fog he was going at fifteen miles an hour. The deceased was pitched out of the car into the road, and a coachman declined to take her to the hospital on the ground that his horses were hurt. The jury returned a verdict of "Accidental death," censured the coachman for his lack of humanity, and expressed the opinion that the chauffeur drove at too high a speed in the fog.

### AN INSURANCE CLAIM.

AT Clerkenwell, the Sporting Newspaper Company, which a witness said consisted of Ralph Russell, of 98, High Holborn, sued the International Motor Insurance Company, Ltd., 2, Haymarket, S.W., for £21 6s. in respect of repairs to a motor-car. Plaintiff's counsel said the claim was under a policy of insurance made by the plaintiffs with the defendant company, who insured against accidents to motor-cars. An accident to plaintiff's car occurred on June 6th last, and when a claim was made defendants said they did not cover damage for mechanical breakdowns, but only accidental damage, and in this case it would only apply to the mudguard, panel, and back lamp. This damage amounted to £5 7s., which they offered to pay. For the defence witnesses who investigated the case said that none of the railings near the Spaniards had suffered damage, nor had there been a new railing added during the whole of the year. The London manager of the defendant company said that after they forwarded a claim to be filled up in respect of the accident Russell took the matter into his own hands and had the car repaired. Altogether six claims had been made in respect of the car. A list of convictions against plaintiffs having been read, it was stated that Russell insured the car on May 3rd. A month afterwards he met with the first of a series of accidents.

Mr. Staplee Firth submitted that the damage was deliberately done by Russell to get money from the insurance company, and by means of fraud.

Deputy-Judge Edge found for the defendants.

## COMMENTS.

HAVING regard to the feeling that was evoked in the Isle of Man last year owing to the disregard of insular prejudices and regulations by a small minority of motorists, it is but natural to expect that the authorities will on this occasion insist upon the enforcement of all rules and mandates on the competitors for the Tourist Trophy. And, so far as the organisers of the event are concerned, the people of Manxland may be assured of the desire to faithfully observe the conditions they may impose. These were duly considered on Tuesday, when the Governor of the Isle of Man and the Highway Board met to discuss the request of the Automobile Club for permission to hold races for the Tourist Trophy, and also for heavy touring cars on Manx roads. It was decided to offer the club Tuesday, May 28th, and Thursday, May 30th, on the understanding that practice must be effected between 4.30 and 7 a.m., and that Sunday practising is prohibited under penalty of disqualification. So far sixteen entries have been received for the Tourist Trophy Race, and three for the International Heavy Touring Car Race, the regulations and drawings for both of which have already appeared in our columns.

### The Scottish Trials.

THE Trials Committee of the Scottish Automobile Club have held numerous meetings themselves and in conjunction with the Technical and Industrial Committees of the Club relative to the rules and conditions of the Scottish Reliability Trial to be held from the 25th to the 29th June next, both inclusive, and they expect to be in a position to issue the preliminary prospectus in the course of a few weeks, when it will be found that only slight deviations from previous routes have been made. Much interest is already being taken in the trial throughout Scotland, and the well-known firm of Pullars, of Perth, have offered, free of expense to the Club, to erect a capacious storehouse for the cars on one of the nights of the trial.

### Traders in Sport.

REFERENCES to the presence of "amateurs" and "professionals" at the gathering of motorists for sporting purposes have been made at the festive board of the Derbyshire A.C., and also at the business table of the Nottinghamshire A.C. These, following upon the warning of Mr. Jarrott with regard to the inadvisability of allowing commercial interests to overshadow the purely sporting instincts in connection with that aspect of motoring, seem to show that the old difficulties are by no means entirely out of the way. The recrudescence of the conflict between "trade" and "amateur" is an annual incident in club life, and must not be lightly set aside. Much can be said for both parties in the matter. Gentlemen connected with the motor trade have, in some districts, been great supporters of local clubs, and naturally do not appreciate resolutions calculated to exclude them from participation in a sport they enjoy as much as those who are in no way associated with the industry. On the other hand, the

purely amateur driver and owner, whose experience is limited to his own car, feels that he is at a disadvantage when competing with a man whose daily pursuits are concerned with cars. The path of settlement is, we acknowledge, a thorny one, often bristling with personal points almost impossible of elimination; but some general agreement will have to be arrived at, and probably something of the subject will be heard at meetings of the Motor Union. So far, the general policy of Club members has been to relegate the subject to the consideration of their committees.

### Hackney Motors.

THOSE interested in "hackney carriages and hackney motors"—to quote the official designation of vehicles let on hire as given by the Inland Revenue authorities—should know that Thursday last was the end of the term of grace allowed by the Department for obtaining licences for such vehicles. Those who during the remainder of the year become liable to the duty must make the necessary declaration within twenty-one days of first incurring the liability. We would also remind those concerned in this matter that if, after making the first return, a person changes his hackney motor to one liable to a higher duty, or takes an additional hackney vehicle into use, new licences must be taken out within the same period of three weeks. The term "hackney motor" is used in connection with, say the authorities at Somerset House, "a motor standing or plying for hire, and includes any motor let for hire by a motor manufacturer or other person whose trade it is to sell motors, or to let motors for hire, provided that such motor is not let for a period amounting to three months or more." The duties charged in the case of a hackney motor exceeding one ton but not exceeding five tons, unladen, include those payable on a "light locomotive" as defined by the Locomotives on Highways Act of 1896. Thus if the motor vehicle to be let on hire exceeds one ton, but does not weigh more than two tons, the total duty payable is £2 17s., of which 15s. is for the carriage licence duty, and two guineas the light locomotive duty. For those above two but below five tons the licence is £3 18s., composed of three guineas for the light locomotive duty, and 15s. for the carriage duty. A hackney motor that weighs not more than one ton, or upwards of five tons unladen, is not chargeable with duty as a light locomotive.

### The Industry in Coventry.

ESTIMATES as to the actual value of the production of the British motor-car industry have been as various as "guesses at truth," and few have been generally accepted as other than approximate. The suggestion of a contemporary that about 3,000 people are at present employed in the business at Coventry has drawn a communication from the Daimler Company, which fixes the total at more than three times that number. In the Daimler works 2,500 hands are employed on motor work alone. Then there is the Humber Company, which employs 2,500, and in addition to these two prominent firms in Coventry there are others, such as the Swift, Rover, Maudslay, Singer, Deasy, Standard, Duryea, Rex, West, White and Poppe, besides many small firms who have not yet created large businesses, so that the total number of hands in Coventry can be

roughly estimated at a minimum of 10,000. In addition to these are a number of makers of accessories; hence this computation may be regarded as fairly accurate; certainly it is not exaggerated.

#### Motor Races on Road and River.

REPORTS of the annual meetings of the various provincial clubs that are now being held in all parts of the country give promise of activity throughout the country during the whole of the coming season. Many interesting gatherings have already been arranged, and others are in course of preparation. Possibly the most novel meet yet devised by a provincial club is that of the Nottingham organisation, which, as will be seen from our report of the seventh annual meeting on another page, intends to hold a combined motor-car and motor-boat carnival on the Trent Embankment. This may be developed into an event of more than usual importance, and, appealing to a wide section of people, secure good support from the public. It was generally felt at the time of the Brighton motor races that the inclusion of a few motor-boat competitions would have conducted to even greater success; the experiment of the Nottingham club in this direction will therefore be regarded with interest.

Touring in Italy.—A Snapshot at Terni.

#### "Use Your Judgment."

APART from its record of the cost of maintaining a motor-car in daily work over a long period, the letter from Mr. E. H. Watson in our Correspondence columns affords some useful hints which may be regarded as supplementary to the information given in our issue of the 19th ult. with reference to the way in which motorists may avoid trouble. The sum of all this advice may be found in the injunction to "use your judgment instead of"—well, a dozen other things that drivers may, and do, perform might be mentioned. Motor driving requires thought, and the head as well as the hand must be used in the work.

#### Alcohol.

AMONG the references to fuels other than petrol that have been made before the Special Committee of the Motor Union, now sitting, none have attracted so much general interest as the evidence with regard to alcohol. Mr. Alexander Duckham has been telling the committee that he considers when alcohol is bought the purchaser buys oxygen, which, when petrol is being made use of, is obtained for nothing from the air, and, further, the alcohol would always contain water, which is absent in petrol. Therefore, from a chemist's point of view, alcohol should be obtained at a somewhat lower price than petrol. He has good authority for stating that 90 per cent.

alcohol can be manufactured at a price of 3d. per gallon. The Revenue and Customs restrictions keep up the price to its present figure. A system of co-operation with the chemical manufacturers of the country and the Government departments might modify in an important manner the high price due to these causes. A rough estimate places the consumption of motor spirit as from five to ten times as great as the quantity of alcohol spirit used for manufacturing purposes in the country. At present ordinary alcohol cannot be used economically on ordinary motor-cars, but the difficulty could be overcome. It is possible to add a percentage of tar benzole to alcohol, and so obtain a mixture which could be used on ordinary cars without material alteration; such, at least, is the opinion of Mr. Duckham, which many would like to see put to the test.

#### The Price of Petrol.

MANY experts have been examined by the Fuels Committee of the Motor Union, and much useful information has been gleaned, but the question is assuming a broader aspect than that of motor-cars merely, and already it is apparent that a wider commission is needed to deal with the problem. The average yield of petrol from crude petroleum is about 10 per cent., the residual products being 90 per cent. of the whole. This aspect of the matter has to be considered by manufacturers, who have to dispose of that large proportion. To remove this great obstacle to the reduction of the price of petrol a carburettor is required to satisfactorily deal with the heavier fractions, up to, say, the boiling point of an ordinary paraffin lamp oil. When this is obtained the manufacturer will be able to rely on a market for 40 to 50 per cent. of his crude oil at remunerative prices. Until then, however, it would appear there will be no considerable weakening of prices—a serious matter when it is remembered that the advance during the last twelve months has added 1d. per mile to the running cost of the motor-buses now working in the metropolis.

#### Obstructing Motorists.

IN one of the suburbs of Newcastle-on-Tyne it has been the custom of the residents to dry their clothes in the public street, lines being hung across the roadway for that purpose. So long as garments waved in the breeze no great harm was likely to result, these acting as signals of danger to wayfarers by car and to those on foot. But when no clothes were out there was a risk, and the driver of the car belonging to the City Engineer of Newcastle has narrowly escaped a broken neck in consequence of this careless custom. Surely it should be the duty of local authorities to prevent such happenings within their area of influence. The regulation of such matters should not be left to bodies like the Motor Union and the automobile associations, which have enough to do in defending motorists, and which should not have to draw upon their resources in carrying the war into the camp of obstructive opponents. Still when, as in the case reported on another page, such associations take up such work, in the absence of a clear sense of duty on the part of the police, motorists should be grateful; and those, as yet, not in the ranks of any organisation should no longer tarry outside the membership of automobile clubs and societies.

#### Children as Motorists.

CHILDREN as motorists have scarcely received the attention they deserve, and many readers will turn to the article on another page in the hope of enlightenment as to the proper attire which is desirable for juvenile passengers in the car. It must not be overlooked that children are more susceptible to changes of temperature than adults, and that the air enters the lungs in too cold a condition when motoring to suit the delicate membrane of the child's throat. More than that the minute particles of dust with which the atmosphere is charged

are liable to enter the lungs and prove injurious to health. Consequently doubts have arisen as to the advisability of attempts to inure youngsters to motoring, and although all the directions given in Dr. Stapler's article may be complied with, the subject is one to be regarded from other aspects than that of dress alone. The matter seems well worthy of discussion, and the reference on another page may well inaugurate a correspondence in which our readers are invited to express their views.

### Motor Track Racing.

◆ THERE seems a fairly general feeling of satisfaction with regard to the prospects of the Brooklands motor racing track and the influence it may have in furthering the development of the motor-car. At the same time some of the men who may be regarded as authorities in the matter look a little askance at the outlook for motor racing, "the true sporting element in it being rapidly dying, and this is entirely due to the influence of commercialism." Mr. C. Jarrott, whose views we have quoted, believes that "the best remaining chance for motor racing in the future is the promotion of contests in which the conditions as to the power of the cars and so forth are exactly equal, so that all the competitors are put to a severe test." Sir Wroth Lethbridge, Bart., who is as enthusiastic in motoring as in many

repairers, with a view to their division into classes, according to capacity and equipment. This seems a good idea in theory, but it would be a bold club that would seek to carry it into practice. Of course, it would not be so difficult were it only a question of gauging stock and inspecting machinery, but the personal equation has to be considered—and there the difficulty of the division would be felt.

### Cabbies and Cars.

◆ THAT cabbies have tastes and inclinations varying with the quality of their fares is well known. But much also depends upon the place in which they happen to be. Thus a cabman giving evidence in the Shoreditch County Court on Monday declared he did not like motor-cars, "they're absolute murder." Wishing to tone down this terrible denunciation, counsel gently suggested that he hated cars. "Hate 'em? No, I don't 'ate 'em; its the drivers I 'ate." Such an attitude is in strange contrast to the utterances that came from the table a few evenings ago when the cabmen of Falmouth held their annual dinner. The chairman cheerfully mentioned that motor-cars had not done much damage to the trade in that town, the natural features of which—its hilly surroundings and narrow streets—seemed to protect it from any rapid innovations in traffic. But in responding to the toast of "The Carriage Proprietors of Fa l

Mr. Chas. J. Glidden, of Boston, and his Napier Car have now reached a total of 39,768 miles and travelled through 36 of the principal countries of the World.

The photographs from which the above illustrations were reproduced were taken during his recent drive on the railway from Chicago to Mexico. The picture on the left shows a Mexican horseman wearing the blanket which serves as an overcoat by day and for sleeping purposes at night. The one on the right depicts Mr. Glidden's car lying alongside the railway track with both front wheels broken. The accident was caused by a stone being wedged between the rails about 50 miles from Mexico City, and as the car was proceeding along the level at about 28 miles an hour it ploughed through the ballast for about 80 yards, and pulled up against the bank at the side of the track. Beyond the breakage of the wheels, the only damage was a slight bending of the axles and some injury to the body work.

other pastimes, expresses himself in favour of the Brooklands course if "motor track racing will tend to the further improvement of the motor-car." At the same time he is "opposed to the manufacture of the high-speed freak machines. Such, "he believes," should be discouraged as being inimical to the interests of the car and its owner. Altogether the subject is an interesting controversy, and one in which our correspondents are showing a lively concern.

### The Appointment of Repairers.

◆ A GREAT improvement has taken place within the last few years in the quality of motor-car repair work and the efficiency of the plant owned by local repairers. Finality, however, has not been reached in this matter, and in some districts the facilities for really good repair work being done are not of the best. In other places they are woefully inadequate for modern emergencies. Something of this kind is hinted in the resolution of the Northampton A.C. asking the central authority to revise the present plan of appointing official

mouth," Mr. W. Mortimer instanced the successful competition of motor-cars in taking away posting and long journey work.

THE experiences of well-known motorists with regard to the longevity of the steel studded Dunlop tyres are given in a new list issued by the Dunlop Pneumatic Tyre Company, Ltd., and serve to show that the day has gone by when the user of such devices could only rely upon 2,000 miles' running before his cover became disintegrated. Mr. S. F. Edge and Mr. D. M. Weigel agree in this, the latter having run a set of these tyres 4,630 miles with every likelihood of further good work, while the former, after running the tyres 3,960 miles, found the inside of the cover in the same condition as when new. In the construction of this studded tyre, the steel studs, instead of being riveted to a strip of leather stuck on to an existing tyre, are built into the fabric and form an inherent part of the tyre itself, thus preventing friction and doing nothing to decrease resiliency. As preventives of skidding the steel-studded Dunlop tyres have done good service, while their immunity from punctures is a point of merit.

## MOTERING DRESS FOR CHILDREN.

EVERY owner of a motor-car is proud to equip himself with the necessary articles of dress, and many enthusiasts even buy their garments before the ordered and long-expected car arrives. Ladies also have their special dresses for short drives or long tours. Only the children are usually forgotten. I often ask my friends, writes Dr. D. A. Stapler, in an American contemporary, why they do not take their children out with them in their car. "Oh, it is too cold for Freddy," or "My child is only three years old," and similar answers are given. I took my children out when they were only five months old, but they were properly dressed. Every motorist knows that water in a small body cools quicker than in the tank of large volume, and radiators are based on this principle. Thus a child may be compared to water in a radiator, which loses its heat very much quicker than water in a tank, here represented by a full-grown person. Therefore, if there is anyone who should be warmly dressed when going out in a motor-car, it is the child. Warm dresses, even on warm days, are, however, not sufficient; they must be suitable for motoring. The greater the velocity

The Author's Children in their Motoring Costume.

of the car the quicker the radiator cools, and, retaining the previous comparison, the dress of the child must be of such material that the heat cannot be lost too quickly. The wind must be kept from penetrating the clothes in order to prevent quick evaporation of perspiration, which would cool the child's body in such a short time that it would shiver. Therefore, the dress must be of leather, which is impermeable to wind. There must be an ample air space between the child's body and the dress to keep the temperature equally warm for a long period. This is best accomplished by a wide overcoat. I found that a long leather overcoat, which is quite loose, is sufficient to keep a child warm and does not require other garments than the ordinary ones of the season. For the child which sits on the front seat a pair of leggings are of good service, even if the legs are covered by a heavy rug. On cold days a muff keeps the children's hands warmer than any gloves could possibly do.

An important question is that of the hat. Ordinary hats, or even leather caps, for girls or boys are inadequate. They usually fly off, and, what is more important, they do not afford any protection for the face or the hair. The face must be protected against the wind, and the hair must be kept free from

dust. I designed a cap which was made by my wife (who also made the coats) after several experiments, and which fits snugly, covering hair and neck, leaving only the face free. No dust can pass under these leather caps, which are soft and cover the neck down to the shoulders. Three or four clasps, as used on gloves, keep the cap closed, and make it impossible for the wind or dust to pass, and are therefore better than buttons and button-holes. The coat covers the lower end of the cap, making it still more dustproof. Clasps are also used on the coat. The sleeves are wide, and tight only around the wrists, where they are closed by clasps.

To protect the child's face against dust and wind (children object to goggles) a shield of thin, transparent celluloid is attached to the cap by means of simple brass fasteners. I first tried mica, which proved unsatisfactory; it breaks easily and is readily scratched. Celluloid is elastic, very light, and cheap. This celluloid shield is kept by clasps in different positions. In fine weather or for city use it is usually kept up. If the wind annoys the child a downwardly inclined position of the shield prevents it from striking the child's eyes, and permits the child to look beneath the shield. It is put down only if the wind is strong, and the child looks through the celluloid, which, however, is transparent enough not to hurt the eyesight, even if worn for a long period. The shield must be of ample size so as to leave a considerable space between shield and nose.

It takes but a few minutes to dress the children, and, as said before, they do not wear any other dresses underneath the leather coat than those in season. I have taken my children on quite extensive tours, and upon arrival at my destination they are always warm, their hair free from dust and their faces free from sunburns and the ill effects of wind. I therefore consider these dresses proper, and warmly recommend them, especially as every mother can make them—not easily, it is true, because the leather is a tough material, but as they last a long time they are quite economical.

## THE COUPE DE LA COMMISSION SPORTIVE.

THE rules and regulations with regard to the race for the Coupe de la Commission Sportive, which is to be held in France in June next, either the day preceding or following the Grand Prix contest, have just been issued. Generally speaking they closely follow those for the Grand Prix, except that the quantity of petrol to be allowed is only 15 litres per 100 kilometres instead of 30, and the course will be 500 kilometres, instead of 800. There will be an entrance fee of £140 per car. Each manufacturer can enter three cars, although the Races Committee reserves to itself the right to reduce this number if necessary. Reservoir capacity for the whole 75 litres allowed for the 500 kilometres must be provided, as no re-filling will be allowed once the start is given. The quantity will be verified as follows:—The day before the race each competitor will be required to bring to the "controle" of the Sporting Commission the quantity of petrol allowed him for the race, which will then be officially measured, and afterwards put in the actual reservoir of the competing car. Eight days before the race models of the reservoir, carburettor, and pipe connections must be submitted to the committee, and must be used on the cars in the contest, after having been passed. All joints and caps are to be made after the model supplied by the committee. Each car must carry two persons—driver and mechanic by whom all necessary repairs must be effected. No change of driver will be allowed during the race except in the case of accident; the competing cars must not exceed an overall width of 5 ft. 9 in., and must be capable of reversing. An important clause in the rules is that which provides for the immediate withdrawal of the car, and the disqualification of the driver and mechanic should any attempt be made to wilfully evade the regulations, and if it can be proved that the manufacturer is a party to the evasion, the latter will render himself liable to a fine of £400 and to disqualification from future events. The entry list will close on the 15th inst.

## SOME CURRENT TOPICS.

### Tendencies in Petrol Motor Design.

Each year M. Lucien Perisse, the secretary of the Technical Committee of the French Automobile Club, prepares a census of the exhibits at the Paris *Salon*, which affords an interesting and useful indication of the tendencies in petrol motor and motor-car design in France. His observations at the show in December last were based on the exhibits of sixty-five automobile builders, and as regards the engines the figures obtained are as shown below:—

	1903. Per cent.	1904. Per cent.	1905. Per cent.	1906. Per cent.
Single-cylinder Engines ...	15	6	8	6.5
Twin-cylinder Engines ...	28	15	20	11
Four-cylinder Engines ...	55	76	71	75
Other Engines ...	4	3	1	7.5

It will be seen that there is a slight diminution in cars with single and twin-cylinder engines, and that four-cylinder cars show a small increase. "Other engines" include the six-cylinder type which is, of course, responsible for the relatively large increase recorded. In reference to the question of cylinder casting, singly, in pairs, or in one piece, we have already alluded to the notable increase of the latter as regards engines of about 10-12-h.p. This has brought about a slight change in the relative position, to the detriment of the cast-in-pairs variety, which, however, is still the most prevalent practice, as the appended table will make apparent:—

	1904. Per cent.	1905. Per cent.	1906. Per cent.
Engines with separate cylinders ...	35	33	33
Engines with cylinders cast in pairs ...	65	63	59
Four-cylinder in one casting ...	—	4	8

The position with regard to inlet valves remains unchanged from that recorded a year ago, only 6 per cent. of the engines displayed having atmospheric valves, as against 94 per cent. with the mechanically-operated type. Although these are the same figures as those given a year ago, there is at least one notable convert to mechanical valves—De Dion—the counterbalance being found in the appearance of the low-powered, one-piece, four-cylinder engine which is furnished with suction valves.

### Preparing for the Driving Season.

It may be useful to remind motorists that this time of the year is a very convenient one for having their cars overhauled and painted, if necessary, or any changes made that may be desired. At present the repair shops are not so crowded with work as they will be in a couple of months, when motorists generally begin driving again, and in consequence the work is likely to be done more carefully. It is, furthermore, a great satisfaction to the owner to have his car in perfect trim by the time spring comes round, so that he need not miss a run on early pleasant days. It is, of course, hardly possible to lay down any general rules as to the parts which should be specially attended to in such an overhauling. The bearings and all wearing parts are, of course, most likely to need attention, and they should be tested for the wear or play that has developed. The steering gear in particular should be made the object of special scrutiny, and if it is found that there is so much back-lash to the steering wheel that it seriously affects the control of the car, the necessary adjustments should be made.

### See to the Brakes.

In addition to the steering gear, the brakes deserve a special examination at the beginning of the season. It should not only be ascertained that they are so adjusted that they will not draw when released, and hold firmly when applied, but the state of their wear should be determined, and if they have already

been taken up almost to their limit, it is advisable to have them re-lined, or, if no lining is used, to have the bands renewed. There is the more reason for renewing or re-lining the brakes now, even though they may not yet be completely worn out, because if they reach this stage later in the season there is always a temptation to postpone the repair, thus courting serious accidents. If repairs and renewals are attended to now there will be fewer interruptions in the use of the car during the summer.

### A French Heavy Touring Car Reliability Trial and Race.

That French motor-car manufacturers are closely watching what is being done in England in the way of competitions and races for touring cars is evidenced by the announcement that, in addition to the events already decided upon, the Competitions Committee of the A.C.F., at the suggestion of the Marquis de Dion, is now drawing up the rules of another competition to be known as the Coupe de la Presse, which will be practically a combination of a Scottish reliability trial and the heavy tour-

Trans-shipping a Daimler Car at Folkestone.

ing car race in Great Britain. It is proposed that the trial shall be held in the Trouville district and be open to four-seated touring cars of a minimum weight of 1,250 kilog., for which the petrol allowance will be 16 litres per 100 kilometres, or about 17.8 miles to the gallon. The contest will be spread over a number of days and will consist of a run of 2,000 or 2,500 kilometres—the exact distance has not yet been decided. Those competitors who successfully survive this test of reliability and regularity will be eligible to take part in the final part of the programme—a 400 kilometre race.

MANY modifications and improvements have been made in the C.T.C. Year Book and Diary for 1907, which now embodies information not to be found in the handbook proper. Commencing with a calendar and lists of officers, it proceeds to give a *resumé* of the various cycle laws and by-laws in force in various parts of the United Kingdom, together with a table showing how local mean time can be readily computed; an article on the Physiology and Hygiene of Cycling; Hints on Touring, and a treatise on India-rubber tyres, all by well-known experts.

## THE BOWDEN MILEAGE RECORDER.

**T**HOUGH a distance recorder may not perhaps deserve to be classed as altogether indispensable to the motorist, it must at least be regarded as an extremely valuable and interesting addition to the car; and the many who are considering what form of recorder to favour for the ensuing season will doubtless be interested in the latest introduction in this line, emanating from the E. M. Bowden's Patents Syndicate, Limited, Baldwin's Gardens, E.C. The task the inventors of the Bowden Mileage Recorder set themselves was to abolish the old form of flexible shaft while retaining the dashboard position, the ubiquitous Bowden wire being requisitioned for this purpose. The general appearance of the recorder will be understood from the following description. That part of the instrument which fits on the dashboard only occupies a space of 3 in. square. The mechanism, which is of a simple and durable nature, is enclosed in a nickel-plated brass casing, and consists mainly of a hardened steel pawl and ratchet wheel with spring return. The spindle carrying the ratchet wheel is extended through the case and terminates in a toothed wheel carrying a pin which engages in the star wheel of the mileage recorder J. This apparatus, although attached to the same base plate as the rest of the mechanism, is entirely self-contained and can be removed from its fixings without interfering with any other part of the device. The fitments at the road wheel end

consist of a round rod of mild steel A, having a clip B at one extremity in order to fasten it to one of the steering arms of the car, and where it is necessary to bend this rod the work can easily be done by any motor repairer or blacksmith. The rod carries an adjustable arm C, which, by means of a set screw, can be fixed at any desired height. It is made to carry the "stop" D in which the outer member of the Bowden mechanism terminates, and also accommodates a bell-cranked lever E working on a hardened pivot. At one end of the bell-crank is a plunger F carrying a length of the inner member of flexible wire mechanism, the other end being made to take a fibre pad G. Screwed to the spokes of the road wheel, or fastened to the hub flange, is an eccentric drum H which imparts a rocking motion to the bell-crank, thus pulling on the inner member of the wire mechanism, and actuating the recorder J on the dashboard. Part of the mechanism has been purposely left exposed, so that one may readily see that the instrument is not "missing." Should this occur, the most likely reason is, the Bowden Co. inform us, the bedding down (not stretch) of the wires, and the remedy is to extend the adjustable "stop" found at either end of the encased wire. As some may doubt the capacity of the Bowden wire to withstand the frictional strain under quick reciprocal movement such as is here involved, it may be mentioned that the makers state the wire has been tested for the purpose to over eighty millions of movements at high speed before giving out, while of course the wire can be renewed at any time at a small cost.

## AUTOMATIC CARBURETTORS.

**C**ERTAINLY few parts of the motor-car are receiving more attention at the hands of designers and manufacturers than the carburettor. "Automatic" or "compensating" are expressions that are constantly on the lips of every salesman, but it is somewhat problematic what is the exact meaning intended to be conveyed by these terms, as the so-called automatic or compensating devices are so varied in their construction and operation as to demand a special explanation in each case.

The aim of all such devices is seemingly to prevent the engine drawing in an explosive mixture too rich in petrol vapour when running on high speeds. The reason for this is found in the fact that as the engine speed increases the suction drawing the mixture into the cylinders increases. The mixture consists of warmed air and petrol vapour which are united in the mixing chamber of the carburettor. In order that an efficient ignition may occur within the cylinders these two constituents must be mixed in certain proportions, and it is the aim of all "automatic" carburettors to maintain the correct proportion at all speeds of the engine. The result desired is commonly effected in either of two ways. One is to govern the supply of petrol through the spraying nozzle by automatically or otherwise controlling a needle valve in the nozzle, so that when the engine speed increases the flow will be restricted. The other is to control the air supply, admitting more when the engine speed increases and reducing it when the speed decreases. The latter method is, remarks an American writer, the more popular at present, though the adherents of the former are increasing rapidly and their efforts are in most cases successful. In regulating the air supply the object to be attained is the maintenance of a uniform degree of vacuum around the spraying nozzle, so that the flow of petrol will be commensurate with the engine speed. In accomplishing this, air is admitted at some point in the mixing chamber between the nozzle and the opening of the induction pipe to the engine. This opening is generally in the form of a valve under spring control, the tension of the spring being such that it is overcome by the suction of the motor. With increasing speed the valve is partially opened and air admitted. The tension of the spring has to be adjusted to each car, and when once properly set rarely needs attention afterwards, providing the strength of the spring remains constant. An objection to many of these auxiliary or compensating valves is the fluttering movement connected with their opening and closing, which is similar to that of a spring hinge door which moves backwards and forwards several times before finally coming to rest. In a rapidly running motor, increases and decreases in the speed follow each other in such quick succession as to require decided opening and closing of the valves. To attain this some makers have attached the valve stem to a dash pot which reduces the fluttering action and gives a rapid and definite opening and closing movement of the valve. In one or two new designs the use of an auxiliary valve is dispensed with, the main air valve being under spring or dash pot control and regulated for variable air entrance. In one make the movement of the air valve is controlled by a diaphragm which on one side presses against the valve stem and on the opposite side is subjected to water pressure from a pump gear driven from the motor. As the motor speed increases the flow of water increases as does also the pressure on the diaphragm, the air valve being proportionately opened. In a few new productions the air inlet are under governor control, but the results are not so successful as with engine suction control. The topic is an interesting and important one, as it bears directly upon the development of efficiency in variable motor speed, a feature of silent and flexible engine running of great consequence in motor vehicles.

A CORRESPONDENT writes:—"If the shoes of a foot-brake are worn out, and have to be renewed, have the new ones made of copper; they will last longer than the car"

## THE BEST ROADS FOR MOTORING.

BY COL. W. J. BOSWORTH.

THERE are two points of view to be considered in selecting the "best roads for motoring," viz.:—(1) that of the motorist whose first aim is to cover a long distance as quickly as possible, (2) that of the man who prefers an interesting and picturesque road to the long, straight and level stretches which are so beloved by the "speed-merchant."

In the former class the Great North road easily heads the list. It has a magnificent surface, no hills of any account, and abounds in long straight runs where one can see a row of telegraph poles stretching in a straight line away to the horizon, as for instance, between Boroughbridge and Catterick. For getting quickly from London to Edinburgh one could not choose a better route than this, but the surrounding country is very flat and devoid of interest, and even the interesting towns which one would expect to pass through from an inspection of the

interesting character of the country passed through. From Doncaster we proceed to Pontefract and Leeds (the part of the road between these two towns is the most unpleasant encountered on the journey, as it lies in a mining district), and thence to Skipton, Settle and Kendal, through one of the beautiful Yorkshire Dales. From Kendal we can go to Carlisle over Shap Fell, or as an alternative to Windermere, over Kirkstone Pass to Ullswater, and round the lake to Penrith, where the main road is rejoined. The road from Carlisle to Edinburgh is full of interest.

For the road to the New Forest we go through Guildford over the Hog's Back to Farnham, and on through Alton and Alresford to Winchester, thence to Romsey or Southampton, and through the New Forest to Ringwood. The road is generally in splendid condition, but loose flints are put down at certain seasons of the year in the Forest. From Ringwood we can continue our journey to Bournemouth, or by Poole and Wareham to Lulworth Cove or Weymouth. This is another road to Devonshire, but

Motoring in the Snow in the Austrian Tyrol.

[Allgemeine Automobil Zeitung.]

map seem mostly to be a mile or two to the right or left of the road, and so are missed. An alternative route, which is much more hilly but a great deal more interesting, will be described later.

The Bath road is another excellent, flat and uninteresting route for the greater part of the way, although the scenery improves a little beyond Marlborough.

The Holyhead road also affords some fine straight stretches, where good speed may be safely attained, although it is not quite so level as the two previously mentioned, and in its latter part (in Wales) is one of the most beautiful roads in the country.

In the second class of roads above enumerated, viz., those with a good surface, although hilly in parts, thus diminishing the speed, but rendering the scenery much more interesting, we will first take an alternative route to Scotland. If instead of going by the Great North road we turn off to St. Albans, and make our way through Northampton, Leicester, Nottingham and through the Dukeries to Worksop and Doncaster; the few extra miles of road will be well repaid by the much more

more difficult than the one first described, as the gradients are steeper.

The Brighton road is justly popular, on account of its being such an easy run from London to Brighton. There are two ways of going, viz., by Croydon and Redhill, or by Sutton and Reigate, the roads uniting for the last half of the journey. The surface is excellent, and there are only two stiff hills, Reigate and Handcross.

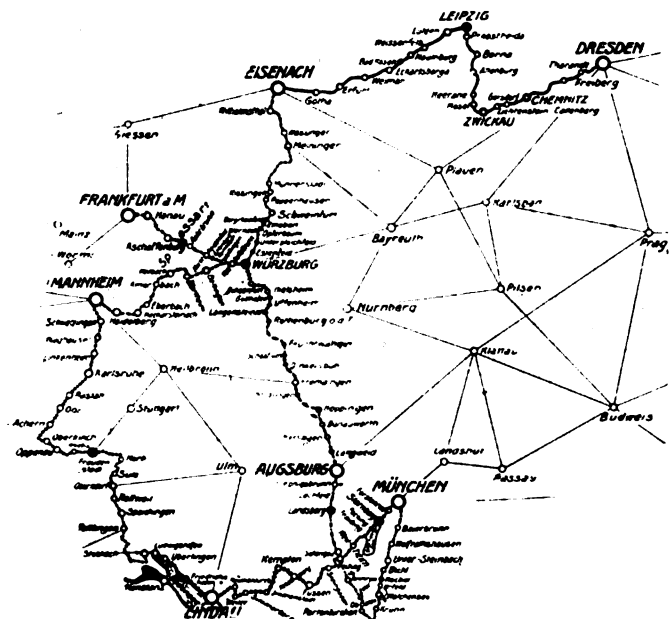

The Eastbourne road is not so good as the Brighton road, as it is very winding, and in places it is difficult to follow the right forks. The best way in my opinion is through Tunbridge Wells and Frant, though there is an alternative route via Westerham and Edenbridge.

The Worthing road is a very pretty one, and goes through Epsom, Leatherhead, Dorking and Horsham. The Hastings road via Tonbridge and Pembury is also quite a good one.

In going to Margate and Ramsgate it is best to go south to Riverhead and Maidstone, instead of keeping to the right bank of the Thames through Gravesend and Chatham.

## The Herkomer Touring Trophy Contest.

June 5th.—Dresden, Chemnitz, Zwickau, Leipzig, Weimar, Eisenach, 359 kilometres.

During the stay at Munich on June 9th an elegance competition is to be held, the maximum number of points to be gained being:—General appearance of car, 80 ; painting, 20 ; upholstery, 50 ; lamps, 10 ; protection against rain, dust and wind, 40 ; luggage-carrying arrangements, 40 ; ditto for tools, 30 ; and ditto for other accessories, 30. Entries at £18 per car.

The "Auto" proposes to hold a trial of "elastic" wheels for motor-cars from April 3rd to the 13th next.—A number of 16-18-h.p. eighteen-seated char-à-bancs have lately been supplied by the N.A.G. Co. of Berlin to the Societe des Tranways d'Alexandrie for service in Egypt.—Arrangements are in hand to hold a motor-car exhibition in St. Petersburg in June next.—The Archbishop of Malines is the latest addition to the ranks of Belgian motorists.—Pressed steel pistons for petrol motors are a recent introduction; they are being made by the Dyle-Bacalan Company, of Louvain, Belgium.—A movement is on foot in the Porte Maillot district of Paris to change the name of the Rue Poisson to Rue Marcel Renault, in memory of the motorist who lost his life in the Paris-Madrid race.

MR. RUFUS ISAACS, K.C., M.P., has, we hear, ordered a Delaunay-Belleville car.

It is reported that an application by the High Sheriff of a county in the Midlands for leave to substitute a motor-car for the horse-drawn vehicle in which the judges are usually conveyed when attending the assizes has been refused by the judge.

PROBABLY for the first time in the history of strikes the motor-car has been extensively used by pickets in the music-hall dispute.

THE Sheffield-Simplex Motor Works, Ltd., transferred their works and offices to the new factory at Tinsley, Sheffield, on the 28th ult.

REPAIR shops for dealing with De Dietrich, Crossley, and motor-cars of other makes, have been opened at Willesden Junction by Messrs. Jarrott and Letts, Ltd.

MR. A. M. THOMSON, A.M.I.M.E., read a paper a few evenings ago before the members of the Glasgow Corporation Car Works Mutual Improvement Association on the motor-car of to-day.

MR. GORDON USMAR is, we learn, severing his connection with Messrs. Harman and Co., the agents for the Vinot cars, and is joining Messrs. Huntley Walker and Co. as sales manager as from the 1st inst.

SOME idea of the progressive popularity of the "Continental" tyres is shown in a statement of the number of the staff of the Continental Tyre Company, which rose from 2,741 in 1903, to 5,716 at the end of December, 1906.

THE South Indian reliability trial, held on December 27th, 28th, and 29th last, was won by Captain Walker's 25-h.p. Peugeot. This trial was over exceedingly bad roads, and was won by a car that has been in use for two years or more.

MR. REGINALD LASSEN, of the firm of Messrs. Teste and Lassen, is leaving England for the United States to-day (Saturday), taking with him a 40-h.p. Weigel car, with the object of seeing what business there is to be done on the other side of the Atlantic.

MESSRS. PRESTWICH AND WARREN are opening a well-appointed garage at Hove. In addition to finding accommodation for the cars of visitors at that resort, they also hold agencies for various districts in connection with the Daimler, Humber, Rover and Climax cars.

THE Local Government Board have declined to accede to the request of the Winchester City Council for authority to close Worthy Lane, in the city, to motor-cars. They do not consider that "the circumstances are such as would justify them in acceding to the application."

A NUMBER of the local employees of Messrs. Mann, Egerton and Co., Ltd., were recently entertained by the directors, when more than eighty sat down to dinner at the Central Café, Norwich, under the chairmanship of the managing director, Mr. G. N. C. Mann, supported by Mr. H. W. Egerton and Mr. F. A. Jackson.

A NEW feature at examinations for the A.C.G.B.I. certificates is the presence of a photographer, engaged by the Club to photograph each candidate for a driving diploma. This system ensures uniformity in the size of the photographs—one of which has to be attached to the driving certificate—and saves a good deal of trouble to the candidates.

A NOVEL method of overcoming speed-changing difficulties has been invented by Capt. the Hon. F. William Stanley. The preliminary road trials have, we are informed, been entirely satisfactory, and, if the inventor's claims can be substantiated, there is no doubt that this method will prove a useful addition to many types of automobile, particularly those used for commercial purposes. The invention consists of a device which automatically changes the gears at the right moment, and without noise. The speed of the car is controlled by one pedal, thus leaving the driver's hands free for steering. We hope to give further particulars of the device when we have had an opportunity of examining the experimental car.

## HERE AND THERE.

THE Maharaja of Poonch has recently acquired a Brown 20-22-h.p. six-seated laudault.

THE Rev. James Corkey, of the Armagh Presbyterian Church, has written, for the benefit of the members of his

congregation who were unable to accompany him, an account of a 724 mile tour in a Humber car through Scotland.

ON the 12th inst. the Challenge Cycle Works at Coventry, which has a floor space of 20,690 square yards, will be offered for auction by Messrs. Loveitt and Sons, of Coventry.

APPLICATION is being made to the Local Government Board for the restriction of the speed of motor-cars through the main streets of Ilford (Essex) to ten miles per hour.

As mentioned in a recent issue, extensive alterations and improvements have recently been carried out at 14, New Burlington Street, London, W., the headquarters of S. F. Edge, Ltd., the premises now forming one of the most sumptuously equipped motor-car showrooms in the Metropolis. Passing through the main entrance the visitor finds himself in a large reception-room, the polished oak floor of which is covered with luxurious carpets. Comfortable lounges, chairs, and writing tables are distributed here and there, while telephones communicating with the various departments are provided. At the

end on the left is the entrance to an electric lift which conveys customers to the new showroom, which is located on the top floor, and of which an illustration is given herewith. The dimensions of the showroom are such as to enable examples of six-cylinder Napier chassis, fitted with all the most popular types of bodies, to be exhibited to the best advantage from the purchaser's point of view, as the light, whether by day or night, is brilliant and makes inspection of the details of the vehicles a simple matter. The chequered flooring, which is of green and white marble, forms an excellent setting for the cars. The basement underneath the reception-room is employed as a store for a few second-hand cars received on sale from customers. The testing of chassis and the storage of completed cars waiting delivery is now effected from the commodious premises recently acquired at 54, Sussex Place, South Kensington, and formerly occupied by the Locomobile Company.

MESSRS. BRANSOM, KENT AND Co., LTD., of 40, Great Eastern Street, E.C., have issued a new catalogue of the tools and machinery required in the motor trade which they supply. This will be of considerable service to automobile agents and repairers interested in maintaining their plant in modern condition. Drilling machines, enamelling ovens, grinding and polishing lathes, cone grinders, cutting lathes, screwing machines, tyre jacks, vulcanisers, &c., are enumerated in a comprehensive list of appliances in constant requirement by the motor trade.

A MOTOR-CAR exhibition is to be held in Prague, Austria, from March 24th to April 1st next.

VISCOUNT KELBOURNE has ordered a 28-h.p. Daimler car, and has also Lord Hawke, the popular Yorkshire cricketer.

MESSRS. TURNER BROS., of Great Brunswick Street, Dublin, have been appointed agents in Ireland for the Cadillac cars.

A CORRESPONDENT writes that common everyday sawdust will be found efficacious in removing grease from the hands.

MESSRS. ARGYLLS LONDON, LTD., have recently shipped a neat delivery van to Messrs. Murias and Co., of Buenos Ayres, Argentine Republic.

MESSRS. A. BINET AND CO., Great Eastern Street, London, E.C., are making a speciality of nickel steel inlet and exhaust

valves for petrol motors, and keep a stock of the sizes for a number of the leading makes of cars.

THE Ameer of Afghanistan is now using a motor-car on all public occasions, as he considers that to ride in a carriage drawn by horses is a waste of time.

THE Euston Motor Company, Ltd., of 124, Euston Road, N.W., agents for the Courier cars, ask us to state that they have no connection with any other firm of somewhat similar name.

THROUGHOUT South-East Lancashire on Tuesday a hurricane of snow and sleet raged for several hours. Several motor-cars were held up during these blizzards along the Bolton and Manchester high-roads.

PREMISES in Northumberland Street, Newcastle-on-Tyne, formerly occupied as a horse repository, are now being opened by the Percy Cycle Company, Ltd., as a motor garage. The firm will also undertake motor-car repairs.

WITH the title "A Successful Motor Trip," the Daimler Motor Co., Ltd., has issued an attractive booklet giving an interesting account of a tour from London to Neuchâtel and back on a Daimler car, made by one of their clients.

COLONIAL orders for six-cylinder Napiers continue to reach Messrs. S. F. Edge, Ltd., with regularity; last week's business included three of the 40-h.p. cars for Calcutta, and two 60-h.p. cars, one for South Africa and one for South Australia.

MESSRS. WARWICK WRIGHT, LTD., inform us that Mr. Lee Guinness has decided to drive a Minerva racing car in the forthcoming contest for the Kaiser's Cup in Germany. A second vehicle will be driven by Mr. Moore Brabazon, and the third by M. Guiot.

ON Monday night a special service of the Fiat motor-bus was run for Miss Lily Harold and her sixteen chorus ladies between the London Pavilion and the Granville at Walham Green. Miss Harold was thus enabled to leave the Granville at Walham Green at the close of her performance, and, changing on board, arrived at the Pavilion in time for her appearance there.

WE learn that a company is being formed to introduce the Renard motor road train into this country. The system, which has already been described and illustrated in the *M.C.J.*, is on novel lines; it comprises a steam or petrol tractor connected to a series of six-wheeled vehicles, having the centre pair of wheels in each case driven by the engine of the tractor through a differential gear and extended cardan shaft with flexible couplings. Thus each vehicle is self-propelled, although all are coupled together. The steering arrangements are such that each vehicle follows accurately in the track of the preceding one, and permits the train to pass round corners with the greatest ease. These road trains are well adapted for use in districts not provided with railway communication, and already quite a number are in use in different parts of the Continent, both for the transport of goods and passengers. We learn from Mr. A. T. Collier, the inventor of the Collier tyre, who is interested in the Renard system, that one of these trains is expected to reach England shortly, when there is little doubt it will attract considerable attention.

THE Central Cycle and Motor Works have a large place in Scotgate, and also the West Street, Stamford.

AN article by Mr. Arthur Candler on Motor Cycling is, unfortunately, crowded out this week owing to pressure on our space.

THE engine of the new Riley 12-h.p. car of the Riley Cycle Company, Ltd., Coventry, is of the two-cylinder type, the cylinders being set at an angle of 90 degrees one to the other.

MESSRS. ARGYLLS LIVERPOOL, LTD., have secured the agency for the Delaunay-Belleville cars for the whole of Lancashire and Cheshire, and have on view at the Liverpool Show a 28-h.p. chassis of this well-known vehicle.

AUTO-CAR AGENCIES, LTD., have been recently appointed sole agents for London and district for Messrs. Dean and Burden Bros., Ltd., of Salisbury, and will open new showrooms at 3, Hanover Court, Hanover Street, W., on Monday next.

MR. NEARING, of Messrs. Huntley Walker and Co., has just completed a business tour round Lancashire on a Weigel car. Altogether he has covered over 6,000 miles in all sorts and conditions of weather, and during that time claims that he has never had to use a tool or effected any repair. Furthermore, throughout the 6,000 miles he used the same set of tyres.

MESSRS. SANDERSON AND SANDERSON, of Percy Street, Newcastle-on-Tyne, have amalgamated with Messrs. Henry Angus and Co., of the same city, and the combined firm of Angus, Sanderson and Co. are erecting new works covering nearly an acre of ground for body building, as well as a fine garage for the accommodation of cars. The firm hold several important automobile agencies for the North of England.

THE Motor Union, upon the recommendation of the Southern Motor Club, has decided to take over the financial responsibility for the prosecution of Inspector Jarrett, of the Surrey Police Force, for an alleged assault upon one of the members of the Union, Mr. W. G. Roberts. A summons for assault has been issued by the Reigate County Bench. The case will be heard on the 9th inst., when Mr. Staples Firth will appear on behalf of the prosecution.

THE Parsons Non-Skid Company, Ltd., report that during the year 1906 the total number of non-skids sold by themselves and their licencees amounted to over sixty-six thousand. Since the new "Grippa" type was introduced in September last the home sales have been more than double those of the preceding nine months. Arrangements are being made for the immediate introduction of the "Grippa" type into several countries in Europe.

WE understand that arrangements are in course of completion for the formation of the British Metallurgique Car Company to manufacture vehicles under the Metallurgique patents in England. Mr. Oscar Cüpper, who will retain the selling agency for the United Kingdom, is also about to open more commodious and central showrooms in London, while repairs works and a garage have been established at Lorne Gardens, Park Road, Regent's Park, N.W.

DURING the recent spell of cold weather a stove-pipe set the building of Reo Motors, Ltd., in Broad Sanctuary, Westminster, S.W., on fire, and for a moment the premises appeared in great danger. Those in charge were in the act of pushing all the cars into the street for safety, when the fire in the most extraordinary manner extinguished itself. The flames went in the direction of the large cistern which was frozen nearly solid, melting the water and allowing it to escape through the burst pipes, and thus extinguishing a fire that was getting almost beyond control.

ELSEWHERE in the present issue we refer to the formation of a company at Legnano to manufacture Wolseley-Siddeley cars in Italy. In connection with this the Wolseley Company send us a photo of the design on the menu card of a dinner held in Milan on January 20th, at which Mr. J. D. Siddeley represented the English company. The allegorical design depicts the meeting of the English and Italian motor industries; in the distance is seen London across the Channel with wheel marks connecting it across Europe to Milan. The lower portion of the design is occupied by a laurel spray, on which the coats of arms of England and Italy are mounted side by side.

[Letters to the Editor should be addressed to the office, 27-33, Charing Cross Road, W.C.]

#### FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter from Mr. F. H. Royce in connection with the Tourist Trophy regulations, I must confess that I was somewhat amused at the latest attempt made by the disciples of six-cylinders to cover up the inefficiency of this particular type. Mr. Royce suggests that a six-cylinder car should receive a larger petrol allowance in the race for the Tourist Trophy than a four-cylinder, and he suggests this because, in his opinion, the six-cylinder car is superior as regards silence and absence of vibration to the four-cylinder, and generally that it is superior for touring purposes. I was very pleased to note that he

of the six cylinders, no doubt the point was one which had to be carefully considered. The net result of the competition was to prove beyond all question that the four-cylinder car from every point of view is preferable, more efficient, and as silent as the six, and yet, in spite of these results, certified by judges of the Automobile Club, Mr. Royce makes a suggestion which I venture to say is not justified in any measure by the situation.—Yours truly,

CHARLES JARROTT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to a letter from Mr. Jarrott in your issue of January 12th, in reference to six v. four cylinders, I am surprised at Mr. Jarrott asking an unsuccessful competitor in an event to make excuses for his non-success. I should have thought Mr. Jarrott was above this; at any rate I do not agree with the principle myself. I note that Mr. Jarrott has now commenced to sell a six-cylinder car, and I can hardly believe that he is doing this unless he believes in it. If, however, he is selling a six-cylinder car, and still contends that it is not as good as a four-cylinder, then he has either a very indifferent one, or, worse still, is selling customers something that he himself is not satisfied with. I do not believe any business will succeed unless what you sell is really

One of the proposed courses for the 1907 Grand Prix Race which is receiving considerable favour is that known as the Circuit de la Seine Inferieure. Our illustration gives a view on the suggested route near the village of Envermen.

admitted in the latter part of his letter that the six-cylinder car was less efficient than the four, and, personally, I should have thought that efficiency was one of the great points in connection with the building of any motor-car. A perambulator runs without vibration and without noise, but it would be a very poor vehicle from a touring point of view, and the same might be said of the inefficient (comparatively) six-cylinder car.

And now I would like to deal with Mr. Royce's assumption that the six-cylinder car is quieter and has less vibration than the four. I am surprised to see that he has not studied the results of the Town Carriage Competition, which is the only competition which has been held where the various characteristics of each particular type and make of car were carefully noted, and awards given according to their merit. In that competition one of the best known six-cylinder cars took part. So far as I can gather from reading the judges' report, it performed very creditably so far as its capabilities would permit it to do so, but on the points which Mr. Royce claims the six-cylinder scores over the four, actually, the four-cylinders beat the six, namely, silence and absence of vibration. In the competition in question, the only point on which the six-cylinder car scored over the four-cylinder vehicles was that it was more accessible to repair than most of the four-cylinder cars, and on this point I think the makers were very well advised, as, with the additional complication

satisfactory to yourself, as customers are bound to find out that you are deceiving them, and this will happen to Mr. Jarrott, I am sure, in due course, if he continues, as he says he does now, to sell something he does not believe in. Mr. Jarrott may as well remember that 104 manufacturers in different parts of the world have copied Mr. Napier's six-cylinder principle because it is the best, and not through any friendship to Mr. Napier or to myself.—Yours truly,

S. F. EDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the correspondence from Mr. Wellington and Mr. Edge which has appeared on the above question. I may say that my firm, the Elsworth Automobile Co., were the first in England to exhibit a six-cylinder car, namely, Spyker. This was shown on our stand in the Annexe at the Exhibition held at the Crystal Palace in February, 1904. It was certainly the only six-cylinder car in the building. The same vehicle in chassis form was exhibited at the Paris Salon on the Spyker stand in the previous December, 1904. At this time, also, it was certainly the only six-cylinder chassis exhibited, and excited very considerable attention from many of the well-known manufacturers of automobiles. I may also say that I saw this chassis

at the works of the Trompenburg Manufacturing Company in Amsterdam at least twelve months prior to the last-mentioned date.

As to the actual running of the six-cylinder Spyker car, I entered the vehicle in the Blackpool races in 1904, in several events, and it competed very creditably against several 60-h.p. Mercedes cars. If I remember correctly, the standing mile was covered at the rate of about fifty-seven miles an hour. I can again say that it was the only six-cylinder car on the course at Blackpool. Now, if Mr. Edge, who is usually to the front with his Napier products, had produced a six-cylinder car prior to December, 1903, why was he not in evidence on any of the three occasions above mentioned? I think it is safe to suggest that it must have been garaged in his brain at this time.

I have often heard of, and believed, in Mr. Edge's sportsmanlike methods, but am beginning to think very differently. Otherwise, instead of immediately and unconditionally accepting Mr. Wellington's challenge in order to uphold the reputation of the Napier cars, why should he loftily declare that he does not wish to hear further about this matter until Mr. Wellington has deposited £1,000 with the secretary of the Automobile Club? I think your readers will agree with me that most of us prefer to choose our own form of charity, and not endeavour to turn them into advertisements, either one way or another. As Mr. Jarrott very aptly remarks in a recent letter on the subject of four v. six cylinder cars, it is unsatisfactory to enter into a newspaper argument with Mr. Edge, since he endeavours to evade the main point at issue. I trust that Mr. Edge will see his way to accept Mr. Wellington's challenge without any unreasonable conditions, so that we all may know who really first constructed a six-cylinder motor-car.—Yours truly,

A. ELSWORTH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re the six-cylinder controversy, as it has now been proved that M. Forest built six-cylinder motors in 1888, although I am confident that the Spyker was previous to Mr. Edge's car, there can be no further use in discussing the matter, and we all now must bow to France, the leader of the motor industry.—Yours truly,

F. F. WELLINGTON.

### THE TOURIST TROPHY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There are two statements in the letter of Mr. F. H. Royce in your issue of January 19th, on the Tourist Trophy Race, which I very naturally hail with delight. They are:

"Buyers of touring cars at the present day place far less importance on the fact of one car being slightly faster or slightly better in petrol consumption than the other, than they do on the fact that one car is more silent and free from vibration than another."

(b). "Unless some recognition is made by the Club in their rules of the fact that silence and absence of vibration are of vital importance they will, in my opinion, not be encouraging the best form of motor."

Something in the neighbourhood of a year ago the Technical Committee of the Automobile Club—a body of gentlemen who I think it is generally recognised have no connection with the trade whatever—decided to allow a special petrol consumption to steam cars for the very reasons stated in Mr. Royce's letter. This decision of the Technical Committee was so frowned upon by manufacturers of petrol cars on the Committee of the Society of Motor Manufacturers and Traders and by manufacturers of petrol cars on the Committee of the Automobile Club of Great Britain and Ireland, that the idea was thrown out.

I think it is generally recognised as being an absolute fact that the White steam car is more silent and more free from vibration than any petrol car which has yet been manufactured. This is my belief and the belief of most people who know much about motor-cars. I may state in passing I am willing to back my belief on this particular point to a considerable amount.

If Mr. Beaumont could calculate, as Mr. Royce suggests, what should be the relative amounts of fuel allowed respectively to cars of different numbers of cylinders, surely it would not have been unwise to allow Mr. Beaumont and his fellow members on the Technical Committee to calculate what would be the respective amount of fuel to be allowed to steam and petrol cars.

I may further state I am under no misapprehension as to who voted at the meeting of the Club Committee for and against the allowance of a special amount of fuel for steam cars for the Tourist Trophy race. I quite appreciate the fact that others than those interested in petrol cars voted against such special allowance, but I am very much of the opinion, and I know others who hold the same view, that if manufacturers of petrol cars and other members of the Club Committee who are financially interested directly or indirectly in the petrol car trade had not voted on this subject a different result might have been obtained.

The long and short of the matter is that Mr. Royce's letter is an appeal for a special allowance of fuel for the six-cylinder car for the Tourist Trophy race, and is also, perhaps unconsciously, an appeal for the admission of the steam car in the Tourist Trophy race on a special fuel allowance. His appeal is based upon a consideration of points which are cardinal points indeed when considered by the buyer of a motor-car, points in which the steam car undeniably and signally excels the vehicle propelled by the internal combustion engine.—Yours truly,

FREDERIC COLEMAN.

### THE ECONOMICS OF MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Prevention is better than cure; it is quite possible to guard against expensive troubles in one's motoring career by the exercise of care, observation, and a deference to the experience of others. This subject, when every motorist is longing for the coming spring, is food for thought in season.

Most mechanical troubles are fundamentally the fault of over-confident drivers, or of owners over-confident in their drivers. The man, and not the motor-car, is often to blame. Recognising this, some time ago I offered a certificate of merit and a prize of £5 to drivers of all cars purchased direct from Argylls, London, 17, Newman Street, W., the condition being that the cost of running 5,000 miles, including tyre, petrol, oil, grease, repair and renewal accounts, should not exceed 10-12-h.p. £42, 12-14 or 14-16-h.p. £47, 16-20-h.p. £52, and 26-30-h.p. £62. Each driver was given a leather-bound pocket book in which a record of all runs was to be kept. This scheme, I felt, would help the owner and the honest driver, and would clearly show the dishonest driver that Argylls was no place for him.

The plan has worked admirably, and many a painstaking and enterprising young chauffeur has earned a £5 note and a certificate of merit which should be of material use to him should he ever require a situation. One of the most creditable records I have received came in last week from a Mr. J. E. S., who drove a 16-20 h.p. standard Argyll 5,000 miles at a total cost of only £20 4s. 6d., or less than a penny per mile,

The Argyll Delivery Van which was driven by Mr. A. Paterson 5,138 miles at a cost of £32 4s. 5d.

his petrol account working out at £13 17s. 6d., equal to 666 of a penny per mile. It was not until he had covered 5,211 miles that he had any tyre troubles, a fact that speaks volumes for the Continental tyres, with which the car was fitted.

Another interesting record was certified last Friday, when I had the pleasure of handing Mr. A. Paterson, who has been in charge of the Ivimy Tea Company's motor-van, £5 for having driven 5,138 miles at a cost of £32 4s. 5d. During the period this car has been running it has had to withstand the wear and tear of much town work, and has also accomplished a long tour amongst the worst roads and most hilly districts of South Wales. This record for a van should be hard to beat. Mr. Paterson's return, I may add, is confirmed by Messrs. Ivimy, Ltd.

My scheme for encouraging the honest and careful chauffeur is being continued, and I anticipate its future success being even greater than in the past. As a hint to motorists generally I may reiterate the advice given in the preface to the driver's pocket-book:—Avoid driving on the tram lines, drive slowly when turning corners, use your judgment instead of applying a brake harshly, start and stop your car gently, keep your tyres inflated to the proper pressure, fill up any cuts in tyres as soon as discovered, examine your car thoroughly at frequent intervals, keep the commutator full of oil, give a liberal supply of lubricant to the front wheels, remember that the lubricant for the gear-box must be liquid and not solid, pay particular attention to the brakes, greasing the rocking spindles frequently; keep the back wheels quite tight on the axle shafts, frequently oil the ends of the radius rods, keep all tools clean and have a place for everything, make a practice of screwing up all grease caps every morning, and not less than once a week inspect the gear-box and the

back axle to see if any more lubricant is required. If your car has a metal disc clutch, inspect it twice a week to see if more lubricant is required.—Yours truly,

E. H. WATSON.

### PROPOSED NEW CAR CLUB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you permit me to announce through your columns that a new car club is projected, and that I shall be pleased to hear from all motorists of good social standing who are willing to take part in the scheme. Our proposal is somewhat ambitious, and comprises not only social gatherings and contests but also the instruction of the members in all that appertains to the motor, and, when practicable, a club-house with storage for cars. We propose to fix the subscription at one guinea per annum, with no entrance fee for the first 250 members. Further details will be given at the inaugural meeting, which will shortly be held in London. In the meantime those who favour the scheme might address me at, 27, Chancery Lane, W.C.—Yours truly,

SAMUEL J. SEWELL.

### THE HEAVY TOURING CAR RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are keenly interested in the race for high powered touring cars, and should have been very glad to have entered one of our N.E.C. 30-h.p. cars for this event, but we fail to see how we could do it without going to prohibitive expense in turning out a car which we believe would be thoroughly unsatisfactory. There are quite a number

perature was somewhere about two degrees Fahrenheit at that time of the morning, and it may sound incredible, but within half a minute all the water that had fallen was transformed into icicles, and hung from all portions of the chassis; furthermore, during the whole of the time I was driving there was ice on the top of the bonnet.

About eighty miles from Paris I was held up by the petrol freezing in the pipes to the carburettor, and when we were attempting to thaw it the water froze in the engine and burst the pump.—Yours truly,

COLIN DEFRIES.

### ANOTHER IGNITION QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. C. Maw's letter in the *M.C.J.* of the 12th inst., and to your reply to the same, I tried the very same thing three months ago, and, just as you surmise, it was a failure. I found it practically impossible to get both sparks to occur at exactly the same time, and therefore I did as you now suggest, viz., switched on six volts when mounting hills.—Yours truly,

J. G. F.

### MOTOR LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A great many articles have recently appeared in technical and other journals by manufacturers and others, on the subject of lubrication. Many statements have been made, some good and many the opposite, but it appears to me that the one great point of friction reduction has been almost forgotten in the controversy, as to whether this or

Two of the Motor Mail Vans in use by the Postal Authorities at Baltimore, U.S.A.

of dimensions given which would not suit us at all and which we believe would only result in a car far removed from an ideal comfortable carriage. There is one dimension which particularly strikes us, and that is the high and quite extraordinary screen which is to be erected behind the driver. Why on earth should this be eight feet from the ground? Certainly 99 out of every 100 cars have the defect of passengers sitting at too great a height, and we suppose this must be the reason, but even then it seems to us too high. On the N.E.C. cars the highest we should ever think of fitting would be seven feet, but if eight feet is the usual height it is obvious we should be penalised if we did fit such a screen, for in practice there is nothing gained by the extra foot; therefore, why should our car in the race be penalised by this extra wind resistance when in normal use it would have this advantage over cars of more ordinary design?

To our mind the conditions make the race not one to encourage improvements but one arranged to give as fair a race as possible between cars of standard design, and while it is so the race can scarcely be considered as one tending to produce improvements in design.—Yours truly,

J. C. MORT.

### AN ADVENTURE DURING THE EXTREME COLD WEATHER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—An adventure which befell me on the 23rd ult. in France may be of interest to you and your readers. I left Paris at six in the morning to undertake a long test of one of the Porthos cars. The boy outside the Grand Hotel who filled the radiator, as is the wont of all small boys, dropped more over the radiator than he put in it. The tem-

perature of the oil does or does not carbonise, &c. The purpose of a lubricant should be to reduce friction. Some favour a thin oil, others a thick oil, generally without any special reason. That both kinds of oil carbonise is certain, but there is no doubt that there is a very great difference in the amount of carbonisation obtained from the various grades of motor oils.

I have been to some trouble to ascertain why such diverse results are obtained, and what class of oil does result in the development of the greatest power with the minimum of carbonisation. Taking an average from the numerous cases investigated, I have found the greatest development of power to result from the use of oils having a comparatively slight viscosity at low temperatures, usually termed thin oils. Previous to carrying out these researches I was a great believer in the heavy viscous oils, as I considered that these only could successfully resist the great heat of combustion, and that such oils would consequently diminish friction to a greater extent than the limpid or thin oils. The latter, I concluded, would carbonise almost as soon as they were subjected to the heat.

My experiments have now incontestably proved to me that the light-bodied oils, consistent with their being adapted for the purpose, provide superior lubrication and give off less carbon and smoke than the heavy grades of oil so often claimed to be the only satisfactory lubricating media. The reason of this is, that the thick oil when in contact with a very hot surface, instead of running off clean and making way for a fresh supply of new oil, only does so in so far as the top layer of oil is concerned, as that part of the film nearest the metal adheres, thickens and becomes carbonised. This process being constantly repeated, the deposit of carbon accumulates, and prevents that free and efficient lubrication of the frictional surfaces which is necessary to the perfect working of the engine. The thin oil, if possessing the necessary friction reducing qualities, is not subject to this drawback. Each film of oil, as it is

applied, does its work, and then makes way for another supply before it has time to thicken or carbonise. Thus there is a continuous circulation of fresh oil, which does not remain on the hot metal long enough to become spent or impair in quality, and the consequence is that, in addition to providing more perfect lubrication, it is cheaper by being more efficiently used. The experiments with the lubricant which gave such good results, and which have convinced me that thin oils are superior to thick ones, were made with Wakefield's motor oil. The heavy oils were well-known grades in regular use.—Yours truly,

J. S. CRITCHLEY.

[The subject raised by Mr. Critchley is an interesting one, and we should like to have the opinions of other motorists on the matter.—ED. M.C.J.]

### MOTOR CARS ON HIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad to know the licence fee to which my car will be liable if I let it out on hire in the ordinary way. I am told that it will be regarded as a hackney carriage and that no private motor-car is allowed to ply for hire. This seems a strange anomaly, when it is remembered that we motorists are already taxed.—Yours truly,

C. P. C.

[Such a vehicle will be regarded as a "hackney motor." Further reference to the subject is made in our Comments on another page.]

### THE CONSTRUCTION OF AN INSPECTION PIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to Rotherham's enquiry in the last issue of the *M.C.J.* as to suitable dimensions for an inspection pit, as we have made a speciality of metal inspection pits for the last two years, and have had considerable correspondence as to the most suitable sizes for general work, we would state as the result of our experience that for a single car a pit six feet long, three feet wide and four feet deep is the one that best meets the general requirements of our clients for an average size car, though for a smaller type of car a pit two feet six inches wide is at times asked for. The question of the correct depth for general convenience of working is a very important one, and we have for some time adopted four feet as a standard, and consider this is the best depth for all round work.

It is a matter of some surprise that although every detail and accessory of the motor-car has been improved in every conceivable way, the motoring world is still content to use the antiquated brick pit which has been in vogue for the last twelve years.—Yours truly,

F. W. BESANT AND CO.

### ACCESSIBILITY AND CLEANLINESS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If I may be allowed to express an opinion on the paper on accessibility, &c., by Mr. Martineau, I would say that I think it a pity that the dominating feature should have been the question of horizontal v. vertical motors, thus causing a considerable discussion anent the withdrawal of pistons, &c. Now I submit that in a well-made modern engine this is a point that, from a purchaser's view, is of infinitely less importance than the multitude of smaller details that require attention with very much greater frequency.

Col. Crompton has the sympathy of all designers when he remarks that it is they, and not the public, who should dictate the features of construction, but unfortunately designers are, in comparison to public opinion, like a fly on a rail in front of a locomotive, they stick bravely to their rail till the engine is about to crush them, when they, if wise, will simply skip on to the front buffer and ride in first. Casting four cylinders together is not in the least necessary if, because so doing "enables the whole of the valve stems and springs to be encased." Such casing in is perfectly simple with singly cast cylinders. Mr. Martineau recommends  $\frac{3}{4}$  in. nuts for keeping the road wheels on. Such a size, except for quite small cars, is certainly not safe practice.—Yours truly,

A. E. S. CRAIG.

### AERIAL NAVIGATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have studied aerial navigation for the past twenty years in my leisure time, but have never been fortunate enough to afford to do what I would like. I have had all the necessary machinery made ready to navigate a balloon for the past five years, but have not had the opportunity of completing the balloon portion of my aerial navigator, and as I now read in the various papers that a gas balloon, no matter how well navigated, is no use if one anticipates competing for the handsome prizes now offered, therefore I have for some time turned my attention upon doing the same thing in the shape of an aeroplane, and hope to have a model ready for the forthcoming exhibition at the Agricultural Hall. I find that my patent combined propeller and steerer is an excellent aid to me in the success of navigating the air. With my new invention without the aid of gas, and by the use of my patent device I can steer at the start, it not being necessary to get away on my machine

before I can steer, as would be necessary by the use of a rudder. I shall be able to raise or lower my position in the air without ballast or extra weight of any kind, and should my engine stop my aeroplane forms the same purpose as though it were a parachute, and will gradually lower me to the earth, and the weight of my person and the engine will answer the same as a man's weight hanging upon the end of a parachute. But I am meeting great difficulty in getting material light enough with the strength I require for the framework. I am having to apply to several of the firms abroad for what I require in the way of light steel and aluminium tube, and this takes a great deal of time. So far as a light engine is concerned I have made inquiries, but find that the price asked is very exorbitant, so I have been obliged to commence making one of my own pattern, owing to the lack of necessary funds to purchase a more expensive machine. It is a great pity that money should stand so much in the way of one's doing what he would like in this respect. I should be very pleased to know who to approach for aid with regard to funds, and who would be willing to join me in equal moieties in my invention, and what can be won with regard to prizes, &c. I claim to be the first engineer who has brought out anything worth protecting for the benefit of this country in aerial navigation, and hope to be well in front in time to come. I am also hoping to place a light and powerful engine, at a reasonable price, on the market this year.—Yours truly,

H. ADAMS.

### OVERHEATING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a small four-cylinder water-cooled car, the cylinders of which are commencing to show a great tendency to become overheated. The radiator is the usual honeycomb pattern, with fan behind, and the cooling system holds five gallons of water. Whenever the car is run hard for a short time the water boils and overflows, while the cylinders get so hot that I am afraid of the pistons seizing. I can find no obstruction in the cooling system, and the water seems to circulate freely, the pump being apparently in good order. I should be glad if you could render me any assistance in locating the cause of the trouble.—Yours truly,

T. MCKNIGHT.

[With reference to the above trouble, the radiator, if properly constructed, should be quite efficient for a small power engine, unless the car is run very hard on the low gear, when nearly all engines are liable to boil the water. We would advise our correspondent to use the top gear more and throttle down for slow work; but, failing this, the cylinders should be dismantled and thoroughly cleaned out, as, if the car has had a deal of running, the cylinder will be found to contain carbon deposit, which in most cases causes excessive overheating.]

### THE INSTITUTION OF AUTOMOBILE ENGINEERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one who attended the meeting of the Institution of Automobile Engineers on the occasion of Mr. Martineau's interesting paper on "Accessibility and Cleanliness," I venture to make a suggestion to the secretary, which if acted upon would, I think, be greatly appreciated, especially by the newer members. My suggestion is in connection with the discussion, and it is that the names of the speakers, in addition to being announced by the chairman, should be chalked up on a board so that everyone present may know to whom they are listening. On the occasion above referred to I failed to catch the names of several of the speakers, and I was not alone in this. Perhaps Mr. Rees Jeffreys will give the matter his consideration.—Yours truly,

W. J. C.

ROVER CARS.—A would-be motorist writes:—"I should be glad if those who own 8-h.p. Rover cars would give their experience of the same. What I would like to know is (1), whether they are reliable, (2) how many miles to the gallon of petrol can they run, and (3) what is their average speed."

ADDRESS WANTED.—We should be glad if Mr. A. J. McKinney would favour us with his address.

LOW FUEL CONSUMPTION.—In connection with the reference to low petrol consumption in our issue of the 19th ult., Mr. T. H. Woollen writes that Mr. C. D. Castell secured the first prize in the Ipswich and East Suffolk Automobile Club Petrol Consumption Trial, which was run on September 15th, 1906. Mr. Castell drove an 8-10-h.p. Clement-Talbot and did fifty-seven miles to a gallon of petrol.

DE DIETRICH CARS.—Messrs. Jarrott and Lettis write:—"A statement has appeared in a number of the motor papers to the effect that Messrs. De Dietrich are now building a six-cylinder car. Please take this as an official notification that Messrs. De Dietrich are not building a six-cylinder car."

THE DUST NUISANCE.—A Scottish correspondent who has been experimenting with a new device to minimise the dust nuisance is advised to communicate with Mr. J. W. Orde, the secretary of the National Dustless Roads Committee, 119, Piccadilly, W.

MR. E. J. CHAMBERS has opened a motor-car depot at 5, Deansgate, Manchester.

## CLUBS AND ASSOCIATIONS.

### NORTH-EAST LANCASHIRE.

NEARLY 100 members and friends of the North-East Lancashire Automobile Club assembled in Blackburn on the occasion of the fifth annual dinner of the club. As the night was fine and dry, several members from Preston, Accrington, and Darwen drove by car to the Exchange Assembly Rooms, where the dinner was held.

Mr. F. G. Hindle (Darwen), in proposing "The A.C.G.B.I. and the Motor Union," said that the sport or pastime, or should he say occupation? had already raised a number of enemies. This was one of the reasons why they should support a central body to defend their interests. The influence and power of the organisation came home to him some twelve months ago, when he was offered quite a host of cars to assist his electioneering work, and at the same time was charged with an array of questions as to his attitude on the motor movement. They as motorists had most to gain by showing the utmost consideration for other users of the highway. He had travelled on roads a good deal in England and France, and could say that there was no county where roads were in a worse condition than in that part of Lancashire.

The Start from Uxbridge of the Auto-Cycle Club's Quarterly Trial.

Mr. J. E. Baxter, in responding, referred to the high esteem in which the N.E.L. Automobile Club was held by the parent society. With a membership of 270 it ranked the fifth provincial club in England.

Mr. Malam Brothers, proposing "The N.E.L.A.C.," congratulated the club upon the conduct of automobilists in the district. The chief constable had no complaints to make, and he believed it was the influence of the club that had brought this about. Mr. A. Birtwistle, in responding, said he hoped the coming season of the club would be equally good and successful with the last, which was the best they had ever had. The membership was double that of twelve months ago, and he hoped that the present committee and members would not rest until the club was first instead of fifth on the list.

The Mayor (Mr. F. T. Thomas) presented the medals which had been won during the past season, and other toasts were honoured.

### LIVERPOOL.

THE annual general meeting of the Liverpool Automobile Club has been held in the Exchange Hotel, Liverpool. In presenting their report for the past year, the committee reported the resignation of their chairman, Mr. T. Thornycroft Vernon, who had acted for two years. They also recorded that in recognition of the services rendered by the Liverpool Club in the past to the cause of self-propelled traffic, the general committee of the Motor Union have voted a grant of £50 to the funds, to assist the liquidation of the balance of the debt incurred in the carrying out of the Heavy Trials of 1901-1902. The Club is thus able to start the year 1907 with a balance in its favour.

Mr. William Becket Hill has been elected chairman of the club for the year 1907. The retiring members of the committee, Messrs. John A. Brodie, Dr. H. S. Hele-Shaw, W. Becket Hill, Anthony G. Lyster, and E. Shrapnell Smith, were unanimously re-elected. Messrs. Walter K. Poulson and Gordon C. Chapman were elected members of the committee in the places of Messrs. A. Bromley Holmes (resigned) and Henry H. West (deceased). Messrs. Malcolm Blair and Vivian A. Simon were re-elected as hon. secretaries.

### YORKSHIRE.

THE annual general meeting of the Yorkshire Automobile Club was held in the Hotel Metropole, Leeds, on the 24th ult., Mr. E. H. Hepper presiding.

Mr. C. P. Wilson, the hon. secretary, presented the annual report, which recorded an excellent year's work. The membership at the end of the year was 260, as against 253 at its commencement. During the year Barnsley and Halifax had been affiliated, and the numerical strength of the club and its affiliated branches now amounted to over 600 members. There had been on the year's working a surplus of £105 12s. 8d., after carrying £30 to the reserve account. The capital account of the club now stood at £178. The speed trials on the sands at Saltburn had been the most successful since the club's formation, and it was anticipated that arrangements would be made during the year to hold another meeting at Saltburn. It was also hoped to hold during the summer a hill-climbing competition. Such a competition would have been held last year, but no satisfactory site could be obtained.

The adoption of the report and accounts for 1906 was moved by the chairman, seconded by Mr. W. Penrose-Green, and carried unanimously.

Mr. P. D. Thomas proposed a vote of thanks to the retiring officers, which proposition was seconded by Mr. C. F. Guest. Mr. E. H. Hepper responded on their behalf.

The following officers were elected to serve during the present year:—Earl Fitzwilliam, president; Messrs. A. W. M. Bosville, C. B. Crawshaw, W. Penrose-Green, H. R. Kirk, A. H. Briggs, vice-presidents; Messrs. A. W. Dougill, A. Exley, A. Farnell, E. Faiers, E. H. Hepper, H. A. Jones, J. L. Kirk, Dr. S. Rumbell, P. A. Stanier, P. D. Thomas, A. Towler, R. Winn, committee; Mr. C. P. Wilson (hon. secretary), Mr. L. Hey (hon. treasurer), Mr. Alf. Masser (hon. solicitor).

The affiliation of the Harrogate A.C. with the Yorkshire A.C. was confirmed. A sum of £5 5s. was voted to the fund in connection with the competition for the tar spreading machines.

A vote of thanks to the chairman, proposed by Mr. H. A. Jones, and seconded by Mr. A. Exley, was carried with acclamation and terminated the proceedings.

Free casual garage may be obtained by members upon production of their membership card at the following garages:—Rowland Winn, Albion Street, Leeds; Yorkshire Mutual Garage, Woodhouse Lane, Leeds; Bridge Garage, Leeds; Bert. Atkinson, Aire Street, Leeds; J. Wales Smith, Woodhouse, Leeds; George and Jobling, Trinity Street, Leeds; St. George's Motor Car Company, Great George Street, Leeds; J. J. Nicholson (on all days except when there are cricket matches at Headingley), Cardigan Road, Leeds; Netherwood Bros., Albion Street, Huddersfield; Edgar Smith, Weymouth Street, Halifax; Dixon and Pilling, Manningham Lane, Bradford; Reynolds Bros., Peel Street, Barnsley; Hull City Garage, North Street, Hull; T. Smurthwaite, Romandy Road, Northallerton; E. A. Colby, Trinity Yard, Dewsbury;

Hoyle Bros. and Co., 26, Police Street, Brighthouse; W. Sleightholme, Pickering Motor Garage, Pickering; and A. Farnell, Manningham Lane, Bradford.

### MANCHESTER.

THE annual general meeting of this club was held at the Midland Hotel, Manchester, when the report of a year's useful work was submitted. Founded in 1899 with thirty-eight members, the club has now a membership roll of 205 and is in a satisfactory financial position. During its summer session ten runs were organised and well attended. The question of dust preventives had had attention, and any complaints as to carelessness or inconsiderate driving were inquired into. A new rule was passed at the meeting entitling ladies to the privileges of membership.

The following officers were elected:—President, Mr. J. A. Morris; vice-presidents, Messrs. T. W. Grace and Frederic Smith; captain, Mr. A. E. Jones; hon. treasurer, Mr. J. Hoyle Smith; committee, Messrs. A. F. Crowdy, T. W. Grace, F. R. Hesse, G. B. Heywood, A. G. Hogg, N. Kilvert, V. F. O'Neill, D. A. Parkyn, Frederic Smith, and John Whitehead; secretary, Mr. J. B. Thistlewaite.

THE Manchester Automobile Club held its annual dinner on Monday at the Midland Hotel, Manchester. The President (Mr. J. S. Morris) presided, and the company included Mr. F. Smith (vice-president), Sir W. H. Bailey, Major Cardwell, Mr. R. Crossley, Mr. J. Hoyle Smith, Mr. R. Peacock (Chief Constable of Manchester), Mr. J. W. Hallam (Chief Constable of Salford), and Mr. J. W. Thistlewaite (hon. secretary). For the first time in the history of the club a number of ladies were present.

Sir W. H. Bailey, who proposed the toast of "Automobilism and the Motor Union," said the motor-car was a means by which one could enjoy the beautiful scenes and rural places of England, the sweetest spot in the world. He never knew England till he went upon a motor-car excursion with their president to the south of England. In connection with the motor-car there were stupid people who objected to speed, and there were other stupid people who objected to being run over. "In order that we may have a proper regard for our own rights," added Sir William, "I would fine anybody five shillings and costs for being run over, just as I would fine anybody ten shillings and costs for catching cold, both being evidences of neglect." If the Motor Union looked after its members in the proper way they would get the support and help of public opinion and would get new laws better adapted to conditions of motoring and of motor protection. He understood that there were some 16,000 members of the Union—a splendid constituency, that could do much to promote the interest of motoring. The motor-car industry in this country found employment for thousands of persons, and he believed that the English-made car was better than any other.

Mr. F. Smith, who responded, said no mechanical contrivance had so rapidly advanced from a state of crudity to one almost approaching perfection as the motor-car. Motorists had come into a great heritage in the roads of this country, not only the main roads, but an almost perfect network of fine roads running all over the country, taking the motorist to every village and small town, country house and park. The President, in the name of the club, made a presentation of plate to Mr. J. Hoyle Smith, who retired after a service of seven years from the position of hon. secretary of the club. In the course of his speech the President said he believed the motor-car in the near future would do much to relieve the congestion of towns. Mr. J. Hoyle Smith suitably acknowledged the presentation.

### DERBY AND DISTRICT.

THE fourth annual dinner of the members of the Derby and District Automobile Club was held at the Royal Hotel, Derby, on Thursday of last week, when between fifty and sixty members and friends partook of a repast, presided over by Mr. R. F. Ratcliff, M.P. for Burton-on-Trent.

After the loyal toasts had been duly honoured the Chairman proposed "Automobilism—the Automobile Club and Motor Union," and said he was sure they all regretted the absence of their president, Mr. G. A. Strutt, who had taken the greatest interest in the club. He believed the future of the manufacture of motor vehicles for commercial enterprise was very great. Their associations would do a great deal to help in that way, though at present among the chief things they devoted themselves to were bad roads and dust. They could all appreciate the feelings of those who had not got motor-cars when they saw a cloud of dust coming along, but he believed the Motor Union were now trying to find some solution to the difficulty. Their association in Derbyshire was one of about eighty local associations, which had joined together for the furtherance of the interests of motoring. They believed there was a great future before them, and it was only by joining together as they had done that they would realise their ambitions, and have perfectly dustless roads, and horseless cars, and glide about the country in a way some of them might dream of, but question whether they would ever realise.

Mr. Rees Jeffreys, in responding, stated that whatever the union had been able to achieve was due in a great measure to the loyalty and support of the various clubs in the country. They had eighty clubs connected with the union, with an aggregate membership of 14,000, and he should like to take the opportunity

of saying that the union had no more loyal or enthusiastic members than the Derby and District Automobile Club. They recognised the difficulty local authorities had in adapting roads to this new traffic, and they knew that the authorities were doing their utmost to help the movement in this way, and to improve their roads to meet motoring requirements. They as automobilists felt it was their duty to help the authorities in this matter, and with this object they had organised a competition in order to find some economical way of settling this question, and they hoped to find some means to make their roads practically dustless, and trusted that the authorities would be able to adopt it. He hoped that during the forthcoming session of Parliament automobilists would not be forgotten, and that it would be remembered that motorists themselves had at their own expense tried their utmost to solve this problem. The increase in the price of petrol was under consideration, and they were trying all they could to fathom the fuel question. It was one of their objects to reduce the price of motorism, and they wanted to bring motorism within the reach of as many people as possible.

Mr. Haywood next submitted "The Derby and District Automobile Club." He imagined that the toast had been entrusted to him because he was an outsider, in that it was very well known, at any rate locally, that the chief constable of a town like Derby could not boast of such a luxury as a motor-car—he ran so many risks. It had been said that the police had been vindictive in their proceedings, but he could assure them it was not so; on the contrary, the police rendered every assistance to motorists in the town. They had not adopted a motor fine in Derby and they did not intend to do anything of the kind at present. In connection with their club he was glad to find that they were moving very steadily and very successfully. He noticed also that they ranked sixth on the list of provincial clubs, and were one of the strongest and most successful as regarded membership and finance. As to the assistance of the police, he could assure them that where they could render it they would. With the toast, which was heartily honoured, was coupled the name of Mr. L. P. Mell.

The Chairman at this stage said it was now his pleasure to present medals to the successful competitors in the contests which had been held under the auspices of the club. Mr. Cyril Smith was presented with a medal in the hill climb. The Challenge Cup had been won by Mr. Spencer Downing, and Mr. L. P. Mell, who had taken great interest in the club, was again second.

Mr. Mell, in responding to the toast, said the club was started in December, 1902, and the first run took place just four years ago that day. The membership then was thirty; last year at that period it numbered 119, and he believed he was right in saying that to-day the members numbered 160. Their financial position, too, was very satisfactory. A year ago they had a balance in hand of £28; now they had £53 in the bank. He went on to refer to the club runs of the past season, and added that for three successive years he had been second in the challenge competition. He took his first two beatings with a good grace, as they were by amateurs, but he rather objected to the last, as it was by a professional, and if professionals were going to be allowed to compete he was afraid amateur competitors would gradually drop out, and the competition would be a ghastly failure, as no amateurs would take the slightest interest in them. However, he did not think the club would allow such a thing to continue.

Dr. St. John proposed "The Visitors," and Mr. Horton (county surveyor), in response, said the roads were not what he should like to see them, but there was no doubt they were improving, and he was watching the experiments which were being made by the Motor Union with great interest.

At the close of the evening Mr. C. J. Allin (hon. sec.) proposed a hearty vote of thanks to the chairman, stating that Mr. Ratcliff had again placed the club under a debt of gratitude by stepping into the breach caused by the unavoidable absence of Mr. G. A. Strutt (president).

### NOTTINGHAMSHIRE.

THE seventh annual meeting of the Nottinghamshire Automobile Club was held on the 25th ult., at the headquarters, the Black Boy Hotel, Nottingham. Mr. C. Hardy (president) occupied the chair, and the large attendance included Messrs. E. W. Wells, A. R. Atkey, B. W. Winter, G. H. Kirk, and G. Cowen (vice-presidents).

Mr. Booth Granger's (hon. sec.) report recorded the fact that the club had maintained a first-class position. They had worked most harmoniously throughout the year with the A.C.G.B.I., and were more closely in touch with the parent club than ever before. The club had also taken a great interest in the proceedings of the Motor Union, and the relations between the union and the club had been most cordial, with the exception of the formation of the Motor Union Insurance Company, which was discussed by the committee very carefully, and the delegates were instructed unanimously to object to the scheme when before the General Committee of the Motor Union. A meeting had been arranged and permission obtained for a carnival and competition on the Trent Embankment during the coming summer, with motor-boat races on the river at the same time, and it was the hope of the committee to make a great meeting of that. They would have to be guided by the conditions of the road in the arrangement of races, but there was no reason why a very interesting programme should not be arranged. They had permission for an enclosure, to which charges would be made, and it was the intention of the committee, if possible, to make a handsome profit,

which would all be devoted to the Nottingham charities. As regarded the membership, they started the year with 166 members, and had elected forty-five during the year. There had been nine resignations, which was more than counterbalanced by new members, the present membership being 205. The financial side of the club was in a very satisfactory condition, for while the balance on December 31st, 1905, after paying all liabilities, was £128 13s. 7d., the balance on December 31st, 1906, was £170 18s. 5d. No member had been reported to the select sub-committee for negligent or furious driving of a car during the year. He desired to thank the committee for the very generous support they had given him during the year. This could not be done without some assistance, and every member had most willingly assisted him at all times, Mr. Wilson Wells's assistance being especially valuable.

The Chairman, in moving the adoption of the report and accounts, said that the club was growing enormously, and there was no reason why it should not continue to increase. Mr. G. H. Kirk seconded, and the motion was agreed to. Mr. A. R. Atkey gave a report on the proceedings of the Motor Union during the year, which was accepted.

Certain resolutions bearing upon alterations in the rules were discussed, the most important of which was a suggestion from Mr. A. N. Lee that at all race or competition meetings of the club events should be divided into three separate classes—(a) closed to amateur members, (b) closed to trade members, and (c) open to all members. Mr. A. Barlow moved that the committee should arrange some fixtures to be confined solely to amateur members of the club. Exception was taken to the use of the word "amateur," and ultimately it was agreed that the committee should take the matter into consideration.

Proceeding to the election of officers, the meeting unanimously re-appointed Mr. Charles Hardy as president. Hearty tribute was paid by the president and Mr. A. Barlow to the untiring zeal of Mr. Booth Granger, on his re-election as hon. secretary. No man, said Mr. Hardy, had worked harder in the interests of the club. The following were elected vice-presidents:—Lieut.-Colonel R. L. Birkin, D.S.O., Messrs. E. W. Wells, A. R. Atkey, B. W. Winter, G. H. Kirk, and Dr. R. G. Hogarth. Messrs. C. Perry, A. Osborne, J. H. Scothern, and G. E. Butcher were re-elected as timekeepers. The following were elected on the committee:—Messrs. W. D. Wells, W. D. Foster, G. R. Cowen, H. Remington, J. J. Spencer, H. D. Snook, A. N. Lee, R. L. Jones, A. Barlow, and Dr. Buckley. Mr. C. E. W. Lucas was re-elected solicitor, and the auditors were Messrs. Williamson and C. L. Stevens.

#### SOCIETY OF AUTOMOBILE MECHANIC DRIVERS.

WE have received from Mr. G. T. Clarke, the Chairman of the Committee of the Society of Automobile Mechanic Drivers, a copy of the revised rules and bye-laws of this Association, which has just been re-organised. We understand that a representative of the society can be seen at any time during the day at Rawlin's Garage, Halkin Street, Belgrave Square, S.W., and that an endeavour is being made to place it on a more business-like footing than has hitherto been the case.

#### MOTOR UNION.

AT the January meeting of the general committee of the Motor Union, Mr. C. H. Dodd, vice-chairman, presided in the absence of the chairman, the Hon. Arthur Stanley, M.P., who is at present on a visit to Egypt. A large number of the delegates were present, representing thirty clubs in various parts of the country, the A.C.G.B.I., and the individual members.

The Legal Cases Committee reported that during the month thirty-eight members had been given legal advice and assistance. The Union decided to take up the case of an appeal to the Divisional Court upon the question of the emission of smoke. Financial grants were made in a number of cases. The aggregate expenditure on legal defence authorised amounted to 75 guineas.

It was reported that arrangements had been made for Motor Union members to be admitted free to the following exhibitions:—Dublin, Birmingham, Glasgow, Newcastle, Manchester, Edinburgh, Crystal Palace, and Liverpool.

Acting on the suggestion of Sir John MacDonald, the committee decided to offer two prizes for the best short essays on the "Preparation for the Forthcoming Parliamentary Struggle." It was also decided to hold a dinner and conference of the hon. secretaries of affiliated clubs on the evening of the same day as the annual meeting of the Union (March 20th), at which points of common interest to secretaries could be discussed.

The committee approved a letter which had been addressed to the National Cyclists' Union asking them to co-operate in observing the rule of the road, especially in using their influence with the cycling community using the Great North Road, numerous complaints having been received by the Union as to alleged obstruction by cyclists.

It was reported that the local clubs were heartily supporting the competition for a tar-spreading machine, and that the membership of the Union had now almost reached 15,000.

#### SOCIETY OF MOTOR-OMNIBUS ENGINEERS.

A PAPER read by Messrs. E. W. Hart and Durnall on "Petrol-Electric Transmission for Road Vehicles," before the Society of Motor-Omnibus Engineers, at the Hotel Cecil, London, gave a survey of the inventions that had endeavoured to solve this method of doing without

change-speed gears. The authors also advocated the use of the polyphase alternating current in place of the continuous current system, as the former method of producing electricity gave a powerful starting torque to the motor and was free from commutator and brush troubles. A discussion on the paper has been adjourned until the next meeting of the Society.

#### LADIES'.

AT the last meeting of the committee of the Ladies' Automobile Club the following ladies were elected to membership of the Club:—Mrs. George H. Kavanagh Bone, Mrs. Cuninghame, Mrs. Ernest Horlick, and Miss M. Molyneux. The first lesson—the principle of the internal combustion engine and its workings—of the fourth course of technical lessons, has been given by Mr. Currie (the club engineer), and attended by about twenty-five members. For the purpose of demonstration a two-cylinder Panhard had been lent to the club by Messrs. Swan and Co., of King's Cross, and one of their four-cylinder 1907 engines by Argyll Motors, Ltd. Mr. Currie dealt briefly with the history of gas and petrol engines, and fully explained what is known as the four-stroke Otto cycle. He also drew attention to the fact that the two-stroke engine is coming into prominence, especially in the aeronautical world, where a light engine is required.

#### WESTMORLAND.

A COUNTY club for automobilists has been formed under influential auspices for the county of Westmorland. The Earl of Derby is the President, and the list of vice-presidents includes the Earl of Lonsdale,

One of the "Motor Trains" in service between Southofen and Hindelang, Bavaria.

Lord Henry Bentinck, and Captain Bagot. Mr. Christopher Wilson, J.P., D.L., who has hitherto acted as the Motor Union's local correspondent for Westmorland, is the chairman, and Mr. Wilfrid Harris is hon. treasurer.

The club has joined the Motor Union and has adopted, with a few necessary modifications, the standard rules recommended by that body. The leading automobilists in the county have already joined the club, and those who desire to be added to the membership roll should communicate with the hon. secretary, Mr. J. J. Thomas, M.I.M.E., Hawthorn Villa, Kendal.

#### SCOTTISH.

THE annual dinner of the Scottish Automobile Club was held on Tuesday night in the Grosvenor Restaurant, Glasgow, Sir J. H. A. MacDonald, Lord Justice Clerk of Scotland, presiding. Mr. E. Wason, M.P., in proposing "Our Imperial Forces," said the Volunteers had been treated shabbily in the past. He was glad there was now to be a movement made in advance. Lieutenant-General Sir E. P. Leach, General Officer Commanding the Forces in Scotland, replied. Alluding to the future of automobilism from an Army point of view, he said he could quite fancy that for home defence the motor-car was destined in the future to play a very prominent part. Mr. T. P. O'Connor, M.P., proposed "Automobilism," and Colonel H. C. Holden replied. The toast of "The Scottish Automobile Club" was proposed by Lord Dunedin, Lord Justice-General of Scotland, and the Chairman replied.

THE Irish Branch of the British Motor Boat Club is extending its influence to Dublin and the Shannon. A Welsh branch is also in course of formation.

## ACCESSIBILITY AND CLEANLINESS.\*

By F. L. MARTINEAU.

(Concluded from page 1059.)

WE now come to detail design. If the engine is of the vertical type, many difficulties exist which may not appear at first sight. To comply with our axiom it should be possible to withdraw a piston without disturbing any other part. To do this necessitates a very large hole in the side of the crank case, or else it must be done from underneath, which is generally very inconvenient. If it is arranged to be taken out at the side, to make it really convenient the engine must be fitted very high up in the frame—so high, in fact, that the fly-wheel and other parts will more or less interfere with the carriage body. Of course, if there is a hand hole in the crank case sufficiently large to take down the big end easily, it is possible to remove a piston by dismounting a cylinder. This method, however, is crude and impractical in most engines by reason of the number of joints to be broken. On a horizontal engine it is possible to make the whole of the top side of the crank case to come off without impairing its strength, and then the whole of the crank shaft, connecting-rods, and pistons are in view, and each part can be easily dismounted separately.

As to the cylinders themselves, there seems to be at the present time a great wave in favour of casting them all together. This may be good from a constructive point of view, but it is not so as regards accessibility and repair. Although in the whole of my experience I have never had to replace a cylinder because it was worn out, I advocate casting them separate on account of accessibility, and so as to be certain of all casting strains and unevenness of expansion being eliminated. A cylinder should be capable of being easily detached without removing even an inlet, water, or exhaust pipe, but only breaking the joints. The valves on most engines nowadays are easily removable, but it should not be necessary, in removing them, to have to take off the spring. This should be arranged to be supported whilst the valve is withdrawn and ground in. At the same time, a valve spring itself should be easily replaceable in case of breakage. Another part which is usually rather difficult to get at is the gudgeon pin. In most cases this is fixed by two taper-pointed screws. As these require very carefully looking with nuts, and are very close up to the side of the piston, they are practically only removable with special tools. At the same time, they have the disadvantage of causing the piston to oval when hot, as the expansion of the piston and gudgeon pins are slightly at variance. To obviate this, as long ago as 1899 I fixed the gudgeon pin in the small end of the connecting-rod by a taper pin, driven through on the side away from the big end. This has been found by experience to be very easily fitted and dismantled, and has never given trouble; it allows for perfect lubrication and free expansion, as well as accessibility.

The ignition distributor should be arranged so as to be easily taken apart and cleaned. This I have managed by making the rotating centre spindle and contact cam withdraw out of its bearing, leaving the whole interior free for cleaning; the end of the spindle is driven by a dog clutch so that it can only be fitted in its right position. The cam shaft should be made to come away sideways; when made to withdraw from one end it often necessitates the taking down of some other part. It is better if arranged so as to be inspected by simply taking off a cover. With regard to carburettors, it is impossible in most of them to ascertain if the petrol stands at the correct height in the float-box, for the simple reason that the float valve has its gear on or is guided by the cover. Why should it not be made independent of the cover? The design which I now use has the float on one end of a lever, the other end of which presses on a horizontally arranged needle valve. In this way the needle valve and its seat can be withdrawn together by undoing the petrol pipe union, and the petrol level can be observed and checked with the top of the float-box off. The float, too, can be easily removed. There is a great tendency to place the pump and magneto by the side of the engine; in this position they cover up space which should be left open for the inspection of the big end brasses and valve gear. To gain the maximum of accessibility they should be in front of the engine, and driven by a shaft at right angles to the engine crank shaft, in a vertical motor. A horizontal engine can have the magneto alongside one cylinder or in front of the cylinders, and no pump need be fitted.

It is essential to have an under shield completely enclosing the engine; it should be tight-fitting, and if it is necessary to have a hand hole in it, the hole should be large enough to work through and a good three-eighths bead carried round it. The shield should be oil-tight and fitted with a sump into which all dirty oil will drain and which can be easily removed and cleaned out. I prefer to make the under shield in the form of separate trays, each oil-tight and easily removable, and sprung into place and fastened. Any tray may then be taken off. As a further protection to the engine, I have carried the frame down to below the step, and carried the latter and the wings into the frame, to which I have joined them. The step is also joined to the back end of the front wing and the front end of the rear wing. With this arrangement there is absolutely no space through which mud can be thrown by the wheels on to the engine, carriage body, or the upper side of the steps. As it is not much use having parts accessible if the tools required to do any adjustment are not at hand, it is as well to consider the

arrangement of these. The step is the most convenient place, and, by having the outfit reduced in size by reason of the small number of sizes of nuts, a duplicate set of spanners can be carried, one set in each step, so that anything can be adjusted from the side nearest to it without loss of time.

We now come to the clutch and gear-box. In the majority of cars these two parts seem, so far as the chassis is concerned, to have received the greatest amount of attention to make them individually accessible. Whether they are so collectively with the carriage body mounted seemed to be to a large extent left to the tender mercies of the carriage builder. Given that the carriage body is not in the way, there is very little to note with regard to either of these parts, as they can be easily dismantled. As regards the back axle, the chief features which have to be retained in view are these: Either wheel should be easily removable. The differential should be accessible. It should be possible to correct the adjustment of the drive, be it bevel, chain, or worm, and the brakes should be easily adjusted, and their adjustment should not require altering to remove a wheel or adjust a chain. From the point of view of cleanliness, if chain drive is used, the chains should be encased, or else the under shield should be prolonged and shaped to protect them. As regards the steering, this is usually arranged so that the various connecting rods are outside the under shield, and the joint ends protected with leather covers. I prefer making all the connections inside as much as possible, and have designed the joints so that they are dust-proof.

## THE FLORIDA RACE MEETING.

As briefly recorded in our last issue, the annual race meeting on the Ormond-Daytona Beach, Florida, commenced on Tuesday, the 22nd ult. The event, however, has not proved the success which has been recorded in former years, partly owing to the absence of French racing vehicles, and partly, it is reported, because the beach itself is not in the usual good condition. On the first day the five miles flying start race was won by Marriott on a Stanley steam racer, in 3 min. 44 4-5 sec. The winner of the five miles standing start event was Blakely, on an American Mercedes, his time being 4 min. 25 sec. A five miles match between a Stanley steamer and the American Mercedes went to the former machine, the time being 3 min. 51 4-5 sec. The flying mile for American touring cars was won by Mr. F. During, on a Stanley steamer, in 53 2-5 sec. On the 24th ult. the principal event was the twenty miles standing start contest for the International Touring Car Championship, which was won by a Rolls-Royce in 23 min. 5 sec. The 100 miles championship was also run off, the winner being Blakely, who on a 90-h.p. American Mercedes covered the distance in 1 h. 26 min. 10 sec. The record was not beaten and is still held by Clifford Earp, who, on a 90-h.p. Napier, won last year in 1 h. 15 min. 40 2-5 sec. Blakely on a 70-h.p. American Mercedes also won a ten miles handicap, a 30-h.p. Franklin being second. The proceedings on Friday, the 25th ult., were marred by a serious accident to Marriott, whose Stanley racer, while he was making an attempt to break the mile record, struck an inequality in the beach, and was hurled into the air. The car, which is reported to have been travelling at the rate of nearly 125 miles an hour, is said to have turned over several times, severely injuring the driver. Owing to the non-success of the meeting next year's gathering is, it is reported, to be organised on an entirely new basis.

## ACTION AGAINST A MOTORIST.

In the Court of Session, Lord Salvesen has heard proof in an action by Robert Glasgow, against George G. Tod, of Edinburgh, for £300 damages for the death of his son Robert, three and a half years old, who was knocked down while crossing the Gallowgate on September 11th by a motor-car belonging to the defender. It was stated that the chauffeur failed to keep a proper look-out, and gave no warning of his approach. It was denied that the chauffeur was to blame, and explained that the accident was due to the boy suddenly turning back on his course. Defendant further pleaded that the chauffeur was not at the time acting in the course of his employment, and explained that during his absence in England the chauffeur took the car and drove his wife and children and two friends to Glasgow, the accident occurring on the return journey. Defender, therefore, pleaded that he was entitled to absolvitor. At the hearing the chauffeur stated that he had taken the car without defender's knowledge. Defender made a similar statement, and counsel for pursuer thereupon intimated that he did not propose to proceed with the case, and that he could not resist decree of absolvitor being granted. Defender, in the circumstances, did not ask for expenses. Decree was given accordingly.

## ATTACK ON MOTORISTS.

AN extraordinary attack on motorists is reported from the West of Ireland. Mr. E. K. Dixon, surveyor for co. Mayo, while travelling in a motor-car driven by his chauffeur, was stopped on the road near Castlebar by three men in a country cart, which blocked the roadway. The chauffeur, dismounting to start the car, was set upon by the men, who knocked him down. Mr. Dixon was roughly handled, but managed to escape and secure help. The men then fled. They were arrested subsequently, and remanded. The chauffeur is in the infirmary in a critical condition.

\* Extract of paper read before the Institution of Automobile Engineers on January 16th.

# THE LIVERPOOL MOTOR SHOW.

THE eleventh annual motor and cycle show was opened in the Tournament Hall, Edge Lane, Liverpool, on Friday of last week. The building, although somewhat difficult of access, is well adapted for the purpose, and under its roof are gathered together about 100 cars, comprising examples of the latest productions of British and Continental factories. The novelty of the show is found in the new Fawcett-Fowler 20-h.p. steam car exhibited by Messrs. Chapman, Von Sobbe and Co., Ltd. The vehicle, of which we give an illustration herewith, and which is built by Messrs. Fawcett, Preston and Co., engineers, Liverpool, in accordance with Fowler's patents, is fitted with a special design of flash steam generator, located at the rear end of the frame. The burner is adapted to use paraffin, a gallon and a half of which will, it is stated, run the car a distance of twenty miles. The engine is located under the bonnet; it is of the four-cylinder high-pressure single-acting type, and drives through a leather cone clutch and cardan shaft to the differential shaft, which latter is connected with the rear road wheels by side-chains. The vehicle, which has a wheel-base of 10 ft., appears to have been well thought out, and more will doubtless be heard of it in the near future, especially as we hear that it is intended to apply the system in the construction of commercial vehicles and motor-buses. Messrs. Chapman, Von Sobbe and Co. also stage a 16-24-h.p. Vinot chassis and examples of the 28-36-h.p. and 30-55-h.p. Daimler vehicles. Messrs. J. A. Wade and Co., of Liverpool, show for the first time a little 7-h.p. two-cylinder car known as the Forrest, in which the usual gear-box is replaced by a friction drive, by means of which any speed between the minimum and maximum can be obtained. They also display the Otav light car—an Italian-built two-seater, which has an air-cooled engine and final transmission by side belts in place of the usual chains. In addition to a range of Star cars, which include 7-h.p., 10-h.p., 14-h.p.,

and the Clement-Talbot and De la Buire by Messrs. G. F. Rimmer and Company, Ltd.

Among the accessories are to be found the Continental, Dunlop, Le Plessan, Palmer, Clincher and Elastest tyres and the Samson and Decleer non-skids, while a new detachable rim known as the Woburn is shown by Mr. Alfred Birchall, of Woburn Hill, Liverpool. The show closes to-day (Saturday).

## CASES UNDER THE MOTOR-CAR ACT.

### — DANGEROUS DRIVING.

Mr. E. W. Hobbs, solicitor, Brighton, last week appeared on behalf of John Macdonald Purvis, chauffeur, in the employ of Mr. Hector Morison, recently summoned for driving a motor-car along Marine Parade at a dangerous speed. It will be remembered that the case was fully gone into at a previous hearing, and was only adjourned for the production of the defendant's licence. This was produced by Mr. Hobbs, and the chairman announced that the defendant would be fined 20s. and costs, or fourteen days.

### — EXCEEDING REGULATION SPEED IN PARKS.

At the Kingston Court Barron Redfern Russell, of the Grand Hotel, Charing Cross, London, was summoned for exceeding the ten-mile speed limit in Richmond Park on January 11th. Mr. F. N. Marcy, who represented the defendant, said he admitted the offence. He had only recently taken out a driver's licence, and at the time he was stopped had not acquired the faculty of gauging the speed at which he was going. A park-keeper said the defendant was travelling at the rate of twenty miles an hour. A fine of £3 and 8s. 6d. costs was imposed. The following were also fined £3 and 8s. 6d. costs, for exceeding the limit in the

Chassis of Fawcett-Fowler Steam Car.

16-h.p. and 30-h.p. vehicles, the latter having a six-cylinder motor. Messrs. Wooler Bros. have on view a 30-h.p. Crossley car and a 40-h.p. Critchley-Norris chassis. The new concern, Argylls, Liverpool, Ltd., make a large show of Argyll cars, the models on view including the 12-14-h.p., 14-16-h.p., 16-20-h.p., and 26-30-h.p. Special mention may be made of the 16-20-h.p. car fitted with a luxurious double landaulet body. The exhibit of the Humber Company, Ltd., comprises a 30-h.p. Beeston Humber with a landaulet body, a 10-12-h.p. Coventry Humber double phaeton, a 15-h.p. car, and a 15-h.p. landaulet. Mr. J. P. White, of Manchester, shows one of the latest 30-h.p. White steam cars. One of the new Speedwell 25-30-h.p. four-cylinder cars, in which the disc clutch is enclosed in an extension of the gear-box, is exhibited by the Addison Motor Company. Messrs. Gormly's, Ltd., Liverpool, are present with a display of the Coventry Humber cars, 10-12-h.p. and 15-h.p., and also have on view a Belsize 20-30-h.p. four-cylinder car with double phaeton body. Messrs. Kelly, Bounphrey and Co., of Birkenhead, stage a 40-h.p. six-cylinder Minerva chassis and a 24-h.p. Morgan car.

Other cars on view include the Alldays, the Ford Junior by Messrs. C. C. Paterson and Company, the Ader and Rothwell by the Exchange Motor Depot, Gladiator by Messrs. Ford and Wright, Birkenhead, the Mass by Messrs. C. W. Donkin and Company, Ltd., the Adams-Hewitt by the Motor Engineering Corporation, the Delaunay-Belleville, and the New Eagle. Berliet and Wolseley-Siddeley cars are shown by Messrs. W. Watson and Company, Liverpool, the Lindsay and Winton by the Birkenhead Motor Company, the Hotchkiss and Vulcan vehicles by Messrs. Welhe and Owens, Ltd., Liverpool, Mercedes, Austin, and Panhard by Messrs. J. A. Lawton and Company, Darracq cars by Mr. William Lea, the Napier, Regent and De Dion by Messrs. Hooper and Sons, Ltd., the Arrol-Johnston and Bell vehicles by the Liverpool Motor House, Ltd., the Simms-Welbeck by Messrs. J. Park and Company,

same park:—Valentine Landery, 47, Bryanston Square, London, W., 23½ miles an hour, and Joseph Lorenzi, 39 Carrington Mews, London, W., 20½ miles an hour.

### — FAILING TO STOP AFTER ACCIDENT.

William Forster, of Coleherne Road, South Kensington, has been fined 40s. and costs, at Brentford, for not stopping his motor-car after an accident at Richmond Road, Twickenham, on December 8th. The allegation was that defendant ran into a led horse and grazed its leg. He denied that any accident ever occurred, and said that he had been a driver eight years and was a member of Lord Montagu's League of Moderate Drivers. Subsequently the fine was reduced to 20s. owing to the large amount of the costs, and the chairman said they were obliged by the statute to endorse the licence.

### — EXCEEDING THE SPEED LIMIT.

At the Kingston County Bench four motorists were fined £3 each and 8s. 6d. costs for exceeding the ten-miles speed limit in Richmond Park.

At Brighton Mr. E. H. C. Polehampton was fined 20s. and costs for driving a motor-car at an excessive speed on the Madeira Road. The police estimated the speed at between 25 and 30 miles an hour. At the same court John McDonald Purvis, chauffeur to Mr. Hector Morrison, of Croydon, was similarly fined for excessive speed with a motor-car on the Marine Parade.

### — THE APPLICATION OF BRAKES ON TRAILERS.

The Padiham Motor Carrying Company have been summoned at Bury for not having on a trailer attached to a motor-lorry a person competent to apply the brake, and Johnson Harrison was summoned as the driver of the motor-lorry. The defendant's representative said that at the time they were unaware of the regulation requiring them to carry a man on the trailer. Mr. Hall (Magistrate's Clerk): Why don't

you read the regulations? It you can afford to buy motor-luries you can afford to spend 1½d. on the regulations. The Chairman (Mr. Mellor) said the offence was really a more serious one than appeared at first sight. It was necessary that those dangerous machines should be under control. A fine of £1 and costs was imposed in each case.

#### ALLEGED RECKLESS DRIVING.

At the Guildford County Bench, Emilie Brouard was summoned for having driven a motor-car in a manner which was dangerous to the public, having regard to all the circumstances of the case, at Send and Ripley, on the 2nd ult. The offence was denied. P.S. Arney deposed that defendant drove his car on the footpath in the village for between fifty and sixty yards. The steam roller was working on the road. The path was gravelled, and separated from the road by a well-defined water-course. There was no one on the path at the time, but people might have come out of the church or schools. Defendant said he turned on to the path to clear the stones, and did not notice there was a footpath. There was nothing to show it clearly, as stones were being spread on the road. The Chairman said they did not wish to endorse the licence, as they would have to do if they convicted. They would therefore dismiss the case on payment of 8s. 6d. costs. At the same time, they thought the police would have been better advised had they summoned defendant for riding on the path. They did not think it was quite a proper case to be dealt with under Section 1.

At Coventry Police Court on Monday, Everard Stubbs was summoned for an offence under the Motor Car Act by having no light on his motor-cycle. Defendant pleaded guilty. P.C. Rollinson stated that on January 15th he saw defendant riding a motor-cycle. Defendant said he had an acetylene lamp, and as a proof that it had only just gone out it was ignited immediately he applied a match to it. A fine of 10s. and costs was imposed.

#### EXCEEDING LEGAL LIMIT.

At the Liverpool Police Court, before Mr. W. Watson Rutherford, M.P., and Mr. Leventon, Mr. Stanley Dennis, Bridgefield, Halewood, has been summoned for driving a motor-car at a greater speed than twenty miles an hour. He was also summoned for failing to produce his licence. It appeared from the evidence of P.C. 263 A that on the 9th ult. defendant was driving his motor-car from Renshaw Street, and passed into Leese Street at an excessive speed. He got across the street, going behind an electric car standing on the metals there, struck a brougham belonging to White's Carriage Company, which was considerably damaged, and also struck a lorry. The facts were not disputed, but it is contended that the steering gear of the motor-car had got out of order, and Mr. Dennis, who was in a hurry, was actually taking the machine to Messrs. Lawton, where it was now undergoing repairs. The damage to the cab had been paid for, while the lorry was not damaged. As to the second summons, the constable asked the defendant to produce his licence, but he was unable to do so; this, it was explained, was owing to the fact that Mr. Dennis had changed his clothes and left his licence in his pocket-book at home. Mr. Rutherford expressed the opinion that it was somewhat reckless of Mr. Dennis to drive a car with a defective steering-gear at the speed he was using in a place like Liverpool, and the Bench thought he ought to be fined. A penalty of £5 and costs was imposed in the first case, the other summons being withdrawn.

Mr. S. F. Edge has been fined £5 and costs at Barnet Petty Sessions for having driven a motor-car at a speed of eleven miles an hour in excess of the limit on the Great North Road. Mr. Borwick, who acted as counsel for Mr. Edge, stated that the speedometer in the car registered only twenty-two miles an hour, and he contended that the speedometer was much more trustworthy than the stop-watches in the hands of the policeman.

#### PUBLIC MOTOR SERVICES.

AN interesting ruling has been obtained at the Marylebone County Court from Judge Sir William Sefton as to the liability of motor-omnibus companies for damage. The Willesden District Council sued the London Power Omnibus Company (Limited) for £26 0s. 7d. in respect of a demolished electric-light standard at Shot-up Hill, Cricklewood. Mr. Murphy, for the plaintiffs, suggested that the driver had been negligent, and had so caused the accident, but his clients were prepared to go further and say that the defendants' machine constituted a nuisance on the public highway. His honour held that there was no proof of negligence, but found for the plaintiffs on the ground of nuisance, inasmuch as defendants had put on the road a vehicle which they could not control in certain circumstances. With regard to the plea of contributory negligence motor-omnibus companies could not expect the road authorities to provide better conditions for them than they did for other vehicular traffic. A stay of execution was granted.

TWO summonses relating to the affairs of the Manchester District Motor Omnibus Company have been before Mr. Justice Parker in the Chancery Division. Mr. Hussey, the liquidator, asked for leave to effect a compromise by which the Wolseley Motor-car Company would have 12,000 out of the 75,000 £1 shares and Mr. D. Boyle would receive £1,750 in consideration of the termination of the agreement appointing him managing director for seven years at a salary of £1,000 a year. Mr. Eve, K.C., for the respondents, read affidavits showing that in the opinion of experts the cars, twenty-two of which are stored in Manchester, are worth £350 each if sold for working in a non-hilly district. A suggestion was made that the proceedings should stand over until the liquidator had

had time to convene a meeting of the shareholders for the purpose of ascertaining whether they approved of the proposed compromise. His Lordship assented to this course, and made an order accordingly.

THE Watch Committee of Chester have promised Messrs. J. A. Lawton and Co., of Liverpool, that they will favourably consider an application to place six motor-cabs in service in Chester.

THE Leith magistrates have licensed a motor-bus to ply between their town and Edinburgh.

A DEPUTATION from the Street Noise Abatement Committee has waited on Mr. Gladstone at the Home Office, Sir Edward Henry, Chief Commissioner of Police, being in attendance. Dr. Robert Ambrose, M.P., introduced the deputation, which included Sir Theodore Martin, Sir Dyce Duckworth, Sir William Hamilton and the Mayor of Chelsea. The deputation urged objections to the noise, speed, weight, smell, and danger from skidding and careless driving of motor-omnibuses and traction engines, and called attention to the absence of police powers to define routes and regulate the hours of running, the damage to property caused by vibration, and the necessity of the police having power to proceed against offenders. Mr. Gladstone, in his reply, stated that he fully admitted the necessity of abating the nuisances complained of, and promised that no effort should be spared to bring about the needed reform. Mr. John Murray and Mr. W. G. Cavendish-Bentinck having thanked the Home Secretary for his courteous reception, the deputation withdrew.

#### COMPANY NEWS.

##### NEW COMPANIES.

STURMEY MOTORS.—£60,000. To acquire the business of the Duryea Motor Company, carried on at Duryea Works, Widdrington Road, Coventry. First directors: Messrs. J. J. H. Sturmev and E. Groves.

MOTOR FUEL COMPANY.—£22,000. To adopt an agreement with P. Dvorkovitz, and to carry on the business of manufacturers and refiners of oils and petroleum spirits, &c. 45, St. Mary Axe, E.C.

LIGHT MOTORS.—£10,000. To acquire the business of a company of the same name.

DE DIETRICH (England).—£100. Manufacturers of and dealers motor-cars, vans, vehicles, &c. 45, Great Marlborough Street, W.

SIMMS-WELBECK CARS.—£18,000. Manufacturers of motor-cars, &c. First directors: R. Simpson and H. P. Simpson. 101, Leadenhall Street, E.C.

MOTOBUS REPLACEMENTS.—£1,500. To take over the business of a motor engineer, &c., carried on by Mr. W. A. Oppermann at New Southgate. Bellevue Mews, Bellevue Road, New Southgate, N.

MERCEDES PETROL-ELECTRIC COMPANY has been registered with a capital of £1,000.

#### OBSTRUCTING A MOTORIST.

AT Westminster Police Court, William Osborne has been summoned for wilfully obstructing the path of a motor-car, the property of Colonel A. R. Wyllie, C.B., in Pont Street, W. Earl Russell, who appeared for the Automobile Association and Colonel Wyllie, opened the case with a few remarks to the effect that the prosecution was instituted solely with the object of establishing the rights of motorists to reasonable use of the highway. In the course of his evidence Colonel Wyllie stated that shortly after noon on January 8th his car was being driven down Pont Street, and just before Cadogan Square it arrived within a few yards of an open van going in the same direction, driven by the defendant. The van was in the middle of the road. When the motor horn was sounded, as a signal that the driver wished to pass the van, defendant deliberately swerved to the right, conveying the impression that he was about to turn down a side street. Immediately after he turned his horse straight, and when similar efforts to pass were made by Colonel Wyllie's driver he repeated his first tactics. This time a collision was only avoided by harsh treatment of the motor-car brakes. Colonel Wyllie ordered his man to pull up directly they had passed, and himself jumped out of the car and stopped defendant's horse, which, far from being restive, was brought to a halt with ease. After hearing two witnesses Mr. Curtis Bennett said that the evidence was conclusive, and fined the defendant 20s. costs, or seven days.

#### THE AUTO CYCLE CLUB'S TRIALS.

ON Saturday the first of the quarterly reliability trials of the Auto Cycle Club was held over the usual 124½ miles course, from Uxbridge to Banbury, via Beaconsfield, High Wycombe, Dashwood Hill, Wheatley, and Islip, returning by way of Bicester, Aylesbury, Berkhamsted, Chesham, Amersham, and Beaconsfield.

There were twenty entrants, nineteen of whom were despatched by Mr. F. Straight in the morning, the first getting away at 9.10 a.m. All were allowed a maximum time of 3 hrs. 58 min. and a minimum time of 3 hrs. 12 min. to cover the fifty-nine miles to Banbury, representing a speed of fifteen miles per hour. At Banbury an hour was taken for luncheon, and 4 hrs. 23 min. maximum and 3 hrs. 30 min. minimum was allowed for the return journey of sixty-five and a half miles.

Non-stop runs were made by the following:—W. H. Wells (5-h.p. Vindec Special), F. Toman (4-h.p. Laurin and Klemont), J. Shaw (3½-h.p. Clyde), F. W. Applebee (3½-h.p. Rex), and M. Geiger (3-h.p. N.S.U.), whilst eleven competitors finished the course inside scheduled time.

## COMMENTS.

**R**APIDLY are men coming to the conclusion that the navigation of the air is but a question of time, and that aerial warfare may take place before the Hague Conferences are no longer necessary. Colonel J. D. Fullerton has informed the Royal United Service Institution that in the next war flying machines will be as necessary as motor-cars, and that they will have a threefold purpose, being used (a) against other airships; (b) against sea forces; and (c) against land armies. A curious possibility is the use of aeroplanes in naval warfare to detect the presence of submarines. M. Santos Dumont has explained how he traced from a position high up in the air the course of vessels some thirty or forty feet below the water, and Colonel J. E. Capper, R.E., has reported that while crossing the Medway in a balloon he and his companions clearly saw the whole course of the intricate channel through the water, "which is not noted for its great clearness." Reconnoitring appears to be the chief rôle of the aeroplane against land forces, but it also enjoys the prospect of setting fire to store depots, attacking mounted troops in formed bodies (these would not be able to beat off the intruder with immediate and sustained rifle fire), and stampeding or destroying horses. For these purposes of offence Colonel Fullerton dismisses the dirigible balloon as an unsatisfactory solution of the problem of flight, but he recommends the construction of flying machines capable of carrying four passengers and 1,500 lbs. of stores; weight, 7,000 lbs. to 10,000 lbs.; velocity, thirty-five to forty miles per hour; i.h.p., 250 to 300. This type of machine would be suitable for reconnoitring and actual attack under favourable conditions, the weight for stores including a light gun for use against opposing flying machines, and a special class of gun with heavy shells for use against troops or ships.

### The Non-skid Trials.

In the presence of a large number of experts interested in the motor-bus, the A.C.G.B.I.'s side-slip and skid prevention competition was continued on Tuesday at the Clement-Talbot works, North Kensington, where a track of wood paving had been covered for a distance of about 100 yards with Thames mud and soft soap, presenting a surface inciting side slip and stimulating evolutions on the part of some of the vehicles that called for agility on the part of Earl Russell, Col. Crompton, Professor Vernon Boys, Messrs. J. W. Orde, Worby Beaumont, Lyons Sampson, and the other officials conducting the tests. Originally forty-one devices were entered for the competition, but, of these only twelve were deemed practical by the judges and allowed to participate in Tuesday's event. Of these four were withdrawn, reducing the actual competitors to eight. The proceedings were somewhat protracted, and the noise test had to be held over in consequence; but the effects of the various devices in mitigating the skidding tendencies of the vehicles were observed under conditions that should determine their comparative value. First, was a straight run down the track, the drivers being required to apply the brakes on a given signal; then they were required to turn sharply to one hand, and after going a few feet to turn in

the other direction. In the first run of the latter event the brakes were not applied; in the second they were.

### Some Good Performers.

NONE of the devices attained perfection, although one or two demonstrated their capacity to get into the straight again after only a slight deviation. Their performances in the forthcoming 1,000 miles reliability run, where details of design and construction will be severely tested, will be regarded with sanguine expectations by those anxious to stop a danger in the motor-bus traffic that is delaying its universal progress. It was unfortunate that the Reilloc tyre of sectional transverse rubber blocks arrived too late to be fixed on a 'bus, while the loose metal ring device of Messrs. Sully and Shailer went no further than the first test, leaving only half a dozen in the running. Of these Mr. H. B. Molesworth's idea of three pairs of wheels—back and front steering—was notable, although we should have preferred to have seen it fitted to a double-deck 'bus, as were the others. The Hartridge device, with its multi-sectional rubber blocks placed in the direction of rotation, also minimised the skidding tendency to a great extent; and the floating metal ring employed by Mr. G. B. Winter did well. Mention may also be made of the performances of the rubber and leather ring tyre of the Westminster Industrial and Financial Developments, Ltd., and of the Parsons floating metal ring with its wood lining. But, of course, these are but casual impressions, and the judges' report will take concern of the behaviour of the devices on the long trial as well as Tuesday's short trips.

### The Brooklands Track.

EVERYONE concerned with the Brooklands Motor Racing Track is working at high pressure in order to get the course ready by May. It is significant, however, that the responsible authorities are unable to fix a definite date on which the track will be completed. Much, of course, depends on the weather during the next few weeks. Meanwhile every endeavour is being made to push the work forward, and night shifts are being employed on the two main portions of the work.

### Tar for Road Purposes.

THE Roads Improvement Association have issued the rules for a competition for the best preparation of tar suitable for road purposes. The competition is supplementary to that for the best tar spreading machine, the rules of which have already been published. It is generally recognised that tar is one of the most satisfactory materials for the treatment of roads with a view of rendering them dustless—regarded from the point of view of the greatest results to be obtained from a given expenditure. The chief object of the competition is to ascertain the cheapest method, consistent with efficiency and effectiveness, of treating crude tar—not necessarily the refined or distilled article—to make it suitable for use upon the road. The considerations which will weigh with the judges in awarding the prize are set out in the rules under the following heads, i.e.:—(1) Cost; (2) ease of application; (3) efficiency; (4) dust-preventing capacity; (5) insolubility; (6) weatherproofness; (7) power of adhesion; (8) time required and effectiveness of

setting; and (9) freedom from harmful or offensive constituents or qualities. The preparation which is adjudged the best will be awarded the Ballymenagh 100 guineas trophy, placed at the disposal of the Association by the Ballymenagh Woollen Factory, Ltd., and also the gold medal of the Association. The judges appointed by the Council of the Roads Improvement Association to determine the comparative merits of the competing preparations are the same as those appointed for the tar-spreading machine competition.

#### In a Saddlery Centre.

WALSALL having attained prosperity in the provision of saddlery and harness for horses, is now anxious to secure a permanence of success by the establishment of the motor industry within its area. The local Chamber of Commerce is seeking to attract motor-car firms to the town, thus following the example of the authorities at Peterborough, Ipswich, Luton, Bedford, Doncaster, and the Garden City near Hitchin. All these places have invited the automobile industry, and now a town which had hitherto been mainly identified with saddlery hopes to secure a motor-car works, negotiations having already been opened up in that direction.

The King and Queen of Spain on their Renault Car.

#### The Motor-Cycle.

THE reply which Mr. Arthur Candler gives in our columns this week to the speech of one of the guests at the Auto-Cycle Club's dinner is deserving of consideration, and continues the discussion begun by Mr. Jarrott with regard to the motor-cycle engine. Mr. Jarrott seemed inclined to look askance on the tendency to increase the power of the motor-cycle, with all the accompanying weight, cost, and difficulties for the ordinary person. He wanted the reduction of weight so that the machine could be enjoyed by the majority instead of a restricted number, many of whom, it may safely be observed, regard it as a first step towards the operation of a car. Motorists must, however, remember that there will always be a considerable number of people debarred from motoring of any kind. Whether efforts are to be made to reach them by reducing power in order to lessen weight and expense, or whether makers are to endeavour to perfect the motor-bicycle as a machine for speedy travel on ordinary roads, is a point for the future. Mr. Candler's view is clearly in favour of the latter aspect of the problem.

#### Carriage of Goods by Motor-Wagon.

MANUFACTURERS and traders in the Potteries have suffered long from what they regard as excessive railway rates. Negotiations with the companies have only protracted the hardships and done little to ameliorate the conditions complained of. At length an attempt is about to be made to find an alternative for the railway, and an invitation to a London motor delivery firm to establish a service of motor-wagons to compete with the canal owners as well as the railway companies is certain to excite much interest, not only in the Midlands, but throughout the country generally. We understand that the motor firm will establish depots for the collection of goods in various centres, and generally carry the merchandise under similar obligations to those recognised by the railways, but there will be a substantial reduction with regard to the charges for freight. The minimum amount of traffic suggested by the motor concern as necessary for the institution of the scheme has been found, and the traders have undertaken not to be led away from the new venture by any pressure which the railway or canal companies may attempt.

#### A Successful Counter Claim.

OFTEN, we are afraid, motorists have had to pay fines and claims resulting from actions in which drivers of horse-drawn vehicles have been plaintiffs, merely because they have accepted the situation as it appeared at first blush. Sometimes a strong defence has secured a reduction of exorbitant demands, whilst the policy of issuing a counter-claim backed by really accurate evidence has resulted in turning the tables altogether. A case in point occurred at the Birmingham County Court last week, when an action was brought against a motorist to recover a sum for damages caused by the alleged negligent driving of a motor-car. Upon going into the evidence of the case, Mr. Blewitt, the Birmingham solicitor, advised the motorist that the driver of the horse-drawn vehicle was alone to blame, and a counter-claim was filed. After hearing all the evidence the jury came to the conclusion that the motorist was not culpable, and that the collision was caused by the plaintiff's own negligence. Not only was judgment given for the defendant, but he was awarded the full amount of his claim against the plaintiff—a very satisfactory, and, in a motor case, somewhat unusual, conclusion.

#### 5,000 Miles in a Balloon.

THE founder of the Aero Club of the United Kingdom, Mr. F. H. Butler, F.R.G.S., has made an important contribution to the literature of aeronautics in his "5,000 Miles in a Balloon," just published by Mr. Horace Cox. The modesty of this presentation of the author's balloon ascents is characteristic; he claims it to be but an unadorned narrative of some of his balloon trips, supplemented by contributions from the Princess di Teano, the Hon. Mrs. Assheton Harbord, Lord Northcliffe, and Mr. Butler's daughter, Mrs. Iltid Nicholl. As a matter of fact it is an authoritative record of the revival of interest in aerial navigation, and when the history of the movement comes to be written will prove indispensable to the author. One useful chapter is entitled "The Aeronaut's Vade Mecum," in which Mr. Butler deals with the questions usually put to the aeronaut by those interested in his pursuit, and supplies answers of interest and value.

#### South Indian Motor Trials.

WE have already notified the fact that Captain Walker's 25-h.p. Peugeot won Class A in the South Indian Motor Trials. This section was for cars driven by paid chauffeurs. In other classes success was attained by the Rajah of Vizianagram's 12-16-h.p. Humber and Mr. G. V. Scovell's 15-20-h.p. De Dion respectively. In the contest, which extended

over four days, seventeen cars and eight motor-cycles started on the first day. Events proved that the roads were practically impassable for motor-bicycles, and that the cars that finished in addition to the three already named were:—Messrs. Simpson and Co.'s 8-h.p. Darracq, Mr. A. S. Hannay's 12-h.p. Humber, Messrs. Simpson and Co.'s 20–22-h.p. Darracq, Mr. F. E. Stewart's 20–22-h.p. Brown, and the Rajah of Vizianagram's 24-h.p. Napier.

#### A Matter of Improvement.

ACCORDING to Mr. Moresby White the "Journal" of the A.C.G.B.I. might be improved by the inclusion of a little poetry, a ladies' column, touring articles, illustrations, and notes upon the "comfortable quarters." Evidently this legal gentleman has not allowed the technicalities of automobilism to overwhelm his sense of what is due to the fair sex, and when his letter on the subject was read to the General Committee of the Motor Union some of those present found themselves in immediate accord with his views. His fine appreciation of the Club journalism has revolted owing to the inclusion of such mundane matters as dinner menus in the official gazette of the club, and his discerning eye has detected the use of scissors and paste in the editorial sanctum. Hence his letter con-

that the drivers cannot see the overtaking traffic. 2. For particulars of any accidents which occurred in their several districts by reason of the use of hooded vans during 1906. 3. Whether the Club consider that any useful purpose would be served if the local Council were asked to adopt a by-law similar to the one in operation in London. Any person who is interested in this matter and is in a position to furnish information is invited to communicate with Mr. Rees Jeffreys, at 1, Albemarle Street, London, W.

#### Tram-cars v. Motor-buses.

THE annual dinner of the Scottish A.C. and the opening of the motor show at Glasgow have served to give the newspapers north of the Border a text whereon to preach automobilism to the people. From the national point of view the speech of Lord Provost Bilsland in declaring the show open was the more interesting utterance. He congratulated the citizens of Glasgow on the prescience of their city fathers, who, by covering the streets with a complete system of tramways, had left no room for the invasion of the motor-bus—the vehicle that had disturbed the quiet of London thoroughfares and threatened the citizens with sleepless nights. It would appear that the tram-car and the motor-bus are to be regarded as

The Florida Race Meeting.—Marriott Preparing to Start on the Stanley Steam Racer.

taining "merely tentative suggestions." Several people have tried to develop the Club Journal, and often have we been reminded of the fable of the old man and the ass in this connection. Fortunately, however, for the success of the automobile movement and the organisations connected therewith, the leading men concerned have always recognised that the independent press fully caters for all the requirements of motorists, who can learn all they want to know for small sums of one penny upwards. The true function of the official organ should be to record in accurate form and without comment the doings of the organisation, leaving the newspaper work to journalists, and looking to the lawyers in matters of law rather than matters of print.

#### The Dangerous Hooded Van.

THE attention of the Motor Union has been drawn to the danger that lies in the use of covered vehicles which are so constructed that the driver cannot see the overtaking traffic. The matter has been discussed by the Highways Protection Committee of the Union, and it has been decided to take concerted action in the matter, and possibly approach the Home Office by a deputation. The Union is therefore circularising its affiliated clubs asking:—1. If there is a by-law in force in their respective districts prohibiting the use of vehicles so constructed

enemies, the former to triumph over the latter—in its present state. At Glasgow, we are told, the motor-bus will have no place owing to the position already won by the trams. At Torquay the coming of the latter has caused the migration of the motor-bus to more northerly regions.

#### Motor Missionaries.

IN pursuance of their intention to extend the membership and influence of their organisation, the Nottingham A.C. are organising a series of gatherings in various parts of the county in order to bring to the notice of unattached motorists the advantages of organisation. The first of these meetings was held last week at Newark, when forty-five motorists accepted the invitation of Captain L. l'Estrange to spend an evening together. So successful was the meeting that a considerable accession to the ranks of the Nottingham A.C. should result, and other clubs should be encouraged to similar propaganda work. In Yorkshire the idea of having branches of the county organisation has done much to develop motor activity in those broad acres, and there is no doubt that other counties are ripe for branching out. The missionary zeal of the Nottingham motorists should be imitated wherever there are societies strong enough to organise such propaganda meetings outside their original area of work.

## THE STANLEY AUTOMATIC CHANGE SPEED GEAR.

**I**N our last issue we briefly referred to the automatic change-speed gear which has been devised and patented by Capt. the Hon. F. W. Stanley. We have since had an opportunity of inspecting and trying the experimental device as fitted to an old Charron car. The idea of the inventor has been to overcome the difficulties of speed changing by means of the usual side lever, by arranging that the motor will itself bring into engagement the particular pair of pinions in the gear-box best suited to the amount of work it is at any moment called upon to perform. In the absence of drawings it is not possible to clearly describe the device, but the photograph reproduced herewith will give some idea of the arrangement adopted. Although at first sight the mechanism may appear somewhat complicated, inspection of the actual model reveals that it is not really so; it has also to be remembered that the picture depicts the experimental gear, which, so far as regards the pinions and other parts by means of which it is operated, will in future be considerably simplified.

In the first place it should be explained that the automatic mechanism seen in the illustration is located below

the driver's footboard between the clutch and the gear-box, and at right angles to the clutch shaft. The shaft, which is continuously driven by the engine, actuates through gearing a spindle on which are mounted in such a way that they must rotate with it arms provided with pivoted pawls 13 and 14. Loosely carried on the same spindle are large disc cams 11 and 12, each formed in one with two small cams 16 and 17, the latter abutting one against the other. The second main portion of the arrangement is that which causes the foregoing mechanism to effect automatically the change of speed. The male portion of the clutch is provided at the rear edge of its periphery with a large toothed ring, which meshes with a small pinion on the end of a short spindle. On this is mounted a ball governor 3 connected with a rod which gives motion to a shaft 4, on which two oppositely-arranged cams 5 and 6 are formed. Other necessary parts to which reference is made below are the catches 7 and 8, the stops 9 and 10, and the roller 15.

Passing now to the action of the gear, it may first be stated that the usual side lever is only required for moving the change-speed mechanism from the neutral position to the first and *vice versa* and for reversing. To start the car from a standstill the engine is speeded up in the usual way, and the lever moved into "first." As the speed of the car increases, and the engine

runs faster owing to the decreased load, the balls of the governor 3 fly out, drawing forward the spindle to which it is attached and giving a rotary movement to the shaft 4; the cam 5 at the same time pushes a catch 8 into the plane of the revolving pawl 13. As the latter travels round and meets the catch, it is forced down on to the stop 9 on the cam 11. This, while loose on the shaft, is now forced to rotate with it, and it being connected with the gear-striking rod, the latter is moved a sufficient distance to bring the second speed pinion into mesh with its corresponding spur wheel in the gear-box. Simultaneous with this operation, or rather slightly in advance of and behind, the cam 17, which is one piece with 11, has raised and lowered 15, by means of which the clutch is withdrawn to facilitate the meshing of the change gear pinions and afterwards re-engaged. The speed of rotation of the shaft is such that the whole operation of changing from one speed to another is made in one revolution, on the completion of which the pawl 13 is lifted from the stop 9 by the bar seen above the shaft 4, and is thus ready set to be again actuated whenever the speed of the engine increases to a sufficient extent to permit the governor balls to fly out and so effect a further change up of gear. The automatic changing from top to third, and so on to first downwards, is carried out in a similar way by the other set of cams, with their corresponding catch and pawl. As the motor slows down owing to the load being too great, as, for instance, when a rise in the road is encountered, the governor balls contract and push the spindle to the rear, so moving the shaft 4 in the opposite direction; the cam 6 operates the catch 7, which causes the pawl 14 to engage with the stop 10 on the cam 12, this being so connected to the gear striking rod as to actuate the latter in the opposite direction to the cam 11. At the same time the clutch is withdrawn and re-engaged by means of the cam 16 and roller. Stops are provided by means of which the mechanism is rendered inoperative below the first and above the fourth speed.

In the course of the short trial run we were able to make we had ocular demonstration of the fact that Captain Stanley has achieved his object to produce an arrangement by which the engine can automatically effect a change of gear and so adjust itself to the road conditions. The speed of the car was entirely regulated by the throttle, the change-speed lever and the clutch being left severely alone, and it was very curious to notice the latter moving of their own accord whenever the gear was automatically altered, the change being unaccompanied by any of the grating noise frequently heard. While the fitting of the automatic arrangement would result in a saving of upkeep expenses in the case of many badly-driven pleasure cars, its principal application probably lies in connection with commercial automobiles and motor-buses, which are frequently called upon to stop and re-start, necessitating considerable use of the change-speed lever and consequent fatigue of the driver. In the car which we tried the change-speed gear was of the usual sliding pinion type; a much simpler arrangement could be adopted in a gear-box in which the various pinions are always in mesh and the requisite pairs of pinions being made to transmit the power by means of "feathers" on a sliding shaft which could be directly connected to the automatic changing mechanism. In such a way, too, as Capt. Stanley pointed out, it would be possible to provide a car with at least six speeds in a box, no larger than that now necessary to give four. As we have already mentioned, the idea is only in an experimental stage, and we shall look forward to its development with considerable interest.

THE hill-climbing capabilities of the Metallurgique cars were recently demonstrated in a run to Brighton and back with Mr. Oscar Cupper at the wheel, accompanied by three friends. The car, which was a 24-28-h.p. and fitted with a standard touring body, was driven the entire distance, including the notoriously steep Handcross Hill, on the top gear. Of course the trip presents no difficulties if the car is suitably geared down, the point of the Metallurgique performance being its accomplishment on a standard vehicle.

## SOME CURRENT TOPICS.

### The Progress of Magneto Ignition.

Reference has, of late, frequently been made in the *M.C.J.* to the fact that magneto ignition is rapidly ousting the older high tension form by means of coil and accumulators. This tendency of the times, which was well indicated at the recent shows, is fully borne out by the statistics prepared in connection with the Paris *Salon* by M. Lucien Peresse, the secretary of the Technical Committee of the French Automobile Club, which are summarised below:—

	1903.	1904.	1905.	1906.
	Per cent.	Per cent.	Per cent.	Per cent.
Magneto .....	28	49	89	96
Coil and accumulators ...	72	51	11	4

From the above it will be seen that the magneto type is now practically universal on the leading French cars, accumulators

used to drive the magneto by means of a belt. The sizes of the pulleys were proportioned so that the magneto ran at about 1,100 revolutions per minute. At this rate of speed the magneto delivered sparks of somewhat over 1 inch in length with great regularity—the discharges being bright and crackling. Careful measurement by means of volt and ampere meters showed that the total energy absorbed by the magneto was 29.1 watts = .039, or about one twenty-fifth horse power—an amount of power which is decidedly trivial. Mr. Clough claims no special degree of accuracy for his tests, the data being qualitative rather than exactly quantitative, but he considers that the result given above is fairly correct as regards the particular machine experimented upon, and in order of magnitude is probably about what magnetos of the high tension type may be expected to show.

### To Encourage Touring.

The Automobile Club du Centre—one of the many provincial organisations in France—has recently made a departure in connection with the encouragement of motor touring which is worthy of more than passing notice. Every motorist knows that it is rarely possible, when travelling in a strange district, to get exact information as to the way to take or the distance

The "Brown" 12-14-h.p. Four-cylinder Car owned by Dr. Cumming, Hull. The photograph was taken at Port Patrick, N.B., where the Government 50 years ago spent three-quarters of a million sterling in trying to make a breakwater and piers. Part of the ruins of the structure can be seen between the occupants of the car. The greater part now lies at the bottom of the sea.

Photo by]

[Mr. J. M. Brownlee, Port Patrick.

and coil having fallen from 72 per cent. to only four per cent. at the present time. Subdividing the figures relating to magneto ignition, it is shown that in 1904 the total was made up of 26 per cent. low tension and 23 per cent. high tension. In 1905 the respective figures were, low tension 39 per cent., high tension 50 per cent., while at the 1906 Show the totals were 24 per cent. low and 72 per cent. high tension, the latter thus showing a considerable advance.

### How Much Power is Required to Drive a Magneto?

We do not remember having seen any figures published as to the power required to drive an ignition magneto, so that a reference to the results recently obtained by Mr. A. L. Clough, an American motor engineer, will no doubt be of interest. The magneto was of the two impulse type, delivering its electrical output to an induction coil through the agency of a condenser. It was intended for use on a four-cylinder motor—the distributor being gear driven from the armature shaft at one-half of the speed of the latter. Both armature and distributor shafts run on ball bearings and the armature and distributor contacts are made by carbon brushes. In the tests a  $\frac{1}{4}$ -h.p. direct current motor was

to the desired place, the information given frequently sending the traveller in the wrong direction. To obviate this difficulty the A.C. du Centre is arranging that there shall be in every town and village one or two persons from whom the touring motorist may not only obtain exact information, but who will render assistance in the way of direction to petrol stores, tyre depots, and motor repair shops gratuitously. In the first instance the club has devoted its attention to proprietors of hotels, cafes, restaurants, and garages. To such of these who recognise the advantages the scheme presents in the way of increased motor traffic in the district it has offered a large road map of the centre of France, a sign-board bearing the word "Correspondant," which will act as the necessary indication to the traveller, and a guide-book. Unfortunately the funds of the club have not permitted them to supply these free, a small charge of 4 fr. being made. In spite of this, however, the scheme has been well received, quite a number of hotel-keepers and garage owners having sought to be appointed a "correspondant" of the club. Each application is being carefully inquired into so that the sign-board shall only be issued to those deemed fully capable of rendering the desired services.

## CONTINENTAL NOTES.

### Motor Traffic in Paris.

The increasing motor traffic in Paris, and especially along the Champs Elysees, has at length resulted in some special regulations being made with regard to the latter well-known thoroughfare. During the past few weeks a special force of policemen has been stationed on all the refuges in the middle of the avenue, with orders, at first, to instruct all drivers of motor-cars to keep in the road on the right, between the pavement and the nearest landing. The road in the middle of the Avenue was thus left for cabs and other vehicles. This arrangement not being found satisfactory, a change has been made in the order, motor-cars now being confined to the central portion of the Avenue and horse-drawn vehicles to the two sides.

### A German Touring Competition.

The Automobile clubs of Frankfurt, Württemberg, Baden, Rheinland, and Alsace-Lorraine have decided to hold a touring car contest in Germany from August 27th to September 1st. The distance of the contest will be 1,000 kilometres, and an average speed of 30 kilometres per hour will be required. The event, in connection with which a first prize of £1,250 is being

### Motoring Events in Belgium.

The Belgian Automobile Club has just decided that the Circuit des Ardennes race shall be run on July 21st; the Coupe de Liedekerke is to be held on July 31st, and the Criterium Internationale de Regularité from July 31st to August 8th.

### Warning School Children.

The Belgian Minister of the Interior and of Public Instruction has just issued a circular notifying the authorities of the schools in the country of the necessity of instructing the children as to the increasing automobile traffic and to the care they should take when crossing roads, &c.

### The A.C.F. Grand Prix Race.

The entry list, at the ordinary fee, for the 1907 race for the A.C.F. Grand Prix closed on the 1st inst., up to which date thirty-four entries had been received—three each Clement-Bayard, Darracq, Motobloc, Panhard, Renault, De Dietrich, Germain, Brasier, and Mercedes, two Weigel, and one each Corre, Porthos, Marchand, Aquila-Italiana, and Christie. Six nations are thus to be represented in the contest, twenty-three of the cars entered being of French construction, three German,

Motoring in Paris.—A View of the Champ Elysees under the new regulations requiring motor-cars to keep to the central avenue and horse-drawn vehicles to the sides.

offered, will include speed trials on the level and on a hill known as the Königsstuhl.

### A Spanish Automobile Week.

Arrangements are in hand to hold a series of automobile events in the Spanish capital during the course of the motor-car exhibition in Madrid in May next. It is proposed to hold a series of kilometre speed trials both with a flying and standing start; on the second day there will be a hill-climbing competition over a 6-kilometre course; while the meeting will close with a garden party, at which the King of Spain may be present.

### A Royal Chauffeur's Adventure.

One of King Edward's chauffeurs was driving one of the Royal cars along the Avenue de l'Opera, Paris, on Friday last week, when the police signalled to him to stop, their attention being attracted to him by the fact that he was driving on the left instead of the right side of the road, and also by the fact that the car bore no number. As he was unable to produce any licence, he was taken to the nearest police station. Satisfactory explanations being, however, forthcoming the driver was quickly released.

three Belgian, two British, two Italian, and one American. The entries for the race for the Coupe de la Commission Sportive are, on the other hand, being sent in very slowly, only three having so far been received. Representatives of the A.C.F. last week-end inspected the suggested Seine-Inferieure course on which to hold the two events, but at the time of writing no decision had been arrived at.

### Miscellaneous Items.

A motor-bus service has lately been started between Stockholm and Lindsjona, Sweden.—A motor-car exhibition is to be held in Stockholm from April 30th to May 15th next.—The N.A.G. Company, of Berlin, have just completed a 40-h.p. car, with detachable limousine body, for the King of Roumania.—The date of the Madrid motor show has been changed; it will now be held from May 4th to 19th next.—The "Matin" has issued a challenge to motorists for a motor trip from Paris to Peking during the coming summer, which the De Dion and Contal concerns are reported to have accepted.—The Danish Automobile Club proposes to hold a reliability trial of motor-cars on May 26th next. The projected course measures about 285 kilometres, and comprises a tour of Seeland.

## ACROSS INDIA BY MOTOR-CAR.

BY THEO MASUI.

**T**HIS winter I went to India with my 14-h.p. Germain chainless car, intending to compete in a reliability trial which was to take place on the road from Bombay to Bangalore and back, as announced by the Motor Union of Western India. On my arrival at Bombay I learned that, unfortunately, the trial had been put off, and soon afterwards that in all probability it would be abandoned altogether. Under these circumstances I decided to undertake a long distance run through the whole Indian Empire from Bombay to Calcutta, passing through Agra, where I hoped to be present at the Durbar which was to be held there in honour of the Amir of Afghanistan.

Before starting on such an undertaking some preparations have to be made. First of all, a provision of petrol, oil, and grease must be sent in advance to certain points along the road, where it crosses a railway line. The Bombay Motor Car Company very obligingly helped me to effect this, and my thanks are also due to Messrs. Laing, Hoare, and Goddard, who rendered me valuable service at Bombay as well as at Agra. Consequently a provision of petrol and lubricants was sent to the railway stations of Nasik, Dhulia, Mhow, Jarana Road and Goona; that forwarded to Jarana Road and Goona, however,

fortunately installed, and, had I had a longer wheelbase, I do not know how we should have crossed some of the rivers, when we found only a boat, styled a "ferry," so narrow that the wheels of my car were poised on the edges.

When all was ready I bade farewell to my good friends in Bombay, and on Saturday, December 22nd, at dawn, we started, our motor snorting joyously. From Bombay to Agra the road measures exactly 759 miles, of which the first 400 lead through hilly country, the rest being nearly all across a plain. The road may be compared to one of our badly kept-up macadamised highways; it is very bumpy in some parts, but on approaching Agra it becomes much better. All along, however, it was very dusty; in places there was a layer of several inches of fine dust, which we raised in clouds, or which we and our motor swallowed when stirred up by the innumerable herds of cattle and carts which we passed. But, after all, I prefer dust to rain, and for this reason I may say that the certainty of having constantly fine weather, a blue sky, and radiant sunshine, constitutes perhaps the greatest charm of this tour in the land of the Rajahs.

Some rivers have stone bridges, well built; others, in lieu of a bridge, have a causeway forming a dam or weir, from the top of which the water escapes, and when, as it often happens at this season, there is only a small flow, it is rather agreeable, for it gives a good opportunity of cooling the tyres; at other crossings there are rather primitive bridges built of wood, covered with a

A Cold Morning up Country.

Introducing an Elephant to the Motor Car at Bhaora.

## ACROSS INDIA BY MOTOR CAR.

proved to be an excess of precaution, because from Jarana Road one enters into the Gwalior States, and His Highness Maharajah Scindia, an ardent motorist, has caused depots of petrol to be installed nearly everywhere in his territory. As I was travelling with a lady, I had also, as far as possible, to give notice of our arrival to the keepers of the "Dak Bungalows" where we intended to put up. This, however, proved not to be of much use, for only on one occasion did I find the place prepared for us. This was not surprising, considering that the keepers on receiving my note—written in English—had to wait for the casual visit of a traveller able to translate my request into Hindoostani.

Finally the car had to be equipped and laden with the beddings, the "tiffin basket" and all the personal luggage, reduced, of course, to the smallest compass, but cumbersome withal, as we had to pass from the tropical climate of Bombay to the rather cool temperature of the interior, rugs, plaids, and great coats being indispensable. As it was necessary to be provided with spare pneumatic tyres, a complete outfit of tools, and a reserve of petrol in case the advance stores had miscarried, besides being four passengers—my wife, my excellent engineer, Johnson, myself, and my native servant—it may easily be conceived that we had a full load. Thanks to the construction of the car and its accessories, we were nevertheless very com-

springy layer of earth; at other rivers there is a similar arrangement fixed on a boat-bridge, as on the river Chambal. In such a case all alight from the car except the chauffeur, and one passes cautiously over, for the whole construction is weighed down and shakes. Sometimes the car sinks and one has to push it along. Finally one gets to the other side, heaving a sigh of relief. For fifteen miles north of Nasik the river Kadwa has no bridge at all, and as it is too shallow to allow the use of a ferry, it has to be forded. Seeing the natives and their carts passing over, one advances confidently. But the car is heavy; it sinks in the sands, the water rises, reaches the flywheel, which churns up magnificent water jets, inundating the carburettor and causing short circuits in the ignition. It means a ridiculous pause in the middle of the stream. Happily the natives are near. They run towards us and help obligingly to gain dry ground. After a few minutes' baking in a delicious sunshine the water evaporates, everything gets all right again, and onward we speed merrily.

Twice we had to borrow a ferry-boat. It was not a very easy affair; at Kalyan, coming out of the Isle of Salsette, on which Bombay is situated, it went off comparatively well, but at the river Tapti, thirty miles north of Dhulia, in the course of our third stage, we came suddenly on the bed of this broad river emptied of about three quarters of its waters. It is particularly steep and sandy, so that the wheels of my

Germain, brave as it was, sank right into the shifting ground to a depth of more than a foot. We had to be pulled out by oxen, but coming to the water's edge it was necessary to get the car on board the ferry, a not very easy matter. We succeeded, however, thanks to the help of legions of natives. Unloading was more easy, but again we had to call in the aid of oxen to drag us over the 500 yards of shore. From one end of the road to the other there is an enormous traffic; we met

Miss Mabel Green on her Reo 16-h.p. Landaulet.

A similar chassis fitted with a standard touring body was recently driven from Plymouth to London without once changing gear, a noteworthy performance for a 16-h.p. two-cylinder car.

bullock carts in thousands, native vehicles drawn by teams of oxen, carting mostly cotton, and riders on horseback. When approaching Agra we saw many dromedaries, mounted by two persons or yoked in pairs to large four-wheeled carts. The number of great herds of zebras, buffaloes or bullocks, goats and sheep is inconceivable. Then there are, of course, the fowls and the stupid curs, without which a good motor-car would feel out of its element. But they all get out of the way, slipping to the right and left into the fields, wherever the road allows it; but, when it is narrow, and flanked by parapets, one has to look out, for oxen and horses make frightful plunges, as the carts travel mostly in caravans, and as the drivers at the sight of the motor immediately stop their teams, and then, having recovered from their stupor, belabour them with sticks. The poor oxen, frightened at this onslaught, draw back and throw themselves sideways. This occasions an obstruction, which can only be overcome by exercising great patience and swallowing a lot of dust. As to wild beasts, though I was assured that some districts traversed abounded in game, we only saw a few antelopes and jackals, usually at daybreak. On the other hand, birds could be counted by several thousands—pigeons, turtle doves, parrots, and other species which one had no time to recognise. There are also the inevitable ravens, so necessary, yet so ugly, eagles and vultures, especially near Agra. It behoves me not to omit mentioning the charming little zebra-striped squirrels, which swarm everywhere.

(To be concluded.)

THE roads to places East of London are by no means pleasant, at all events in their early stages, as they go through the least attractive suburbs of the Metropolis. In going to Lowestoft or Cromer, one has to traverse Whitechapel, Bow, Stratford and such like places. However, when London is once left behind the roads are quite good, if not very attractive from a scenic point of view.

## TOOLS FOR MOTOR REPAIRING.

THE rapid development of the automobile movement during the past few years has not only brought about an extraordinary demand for machine tools for works, but also for smaller tools for repairers and private garages. Not a few motorists in different parts of the country who own two or more cars have found it advantageous to establish a small repair workshop in connection with their motor house. Among the firms devoting special attention to the manufacture of small tools adapted for the purpose referred to is Messrs. Drummond Bros., Ltd., of Ryde's Hill, near Guildford, who have recently introduced a useful 3½ in. self-acting, sliding, boring and screw-cutting lathe, which is not only of high grade construction, but is claimed to have a capacity of making throughout a 3-h.p. cycle motor. The bed, which has a short gap, is 2 ft. 6 in. long, and among the other details are a back-gear, set-over headstock with steel hollow mandrel running in adjustable gun-metal bearings, set-over tailstock with steel barrel and square thread screw; a self-acting slotted boring carriage, carrying a slide rest, graduated for taper turning, a set of change wheels cutting all Whitworth threads from ⅛ in. to 2 in., also fine threads and all usual metric pitches, and a heavy turned three-speed fly-wheel with a well designed treadle motion. Messrs. Drummond inform us that they have supplied this tool to the War Office after it had passed some very stringent tests with regard to accuracy of construction, amongst which may be remembered allowance of error in facing slide, 0 in.; spindle of lathe to run true to 1/1000 in. per ft., and spindle fast and loose, headstock parallel to bed and true with bed, 0 in. These tests, together with the moderate price, should commend the lathe to those motorists who are contemplating laying down a small plant to carry out their own repairs.

## A NEW WIND SCREEN JOINT.

IN a recent issue we referred to a new adjustable joint for wind screens which was being placed on the market by Messrs.

James Neale and Sons, Ltd., of 68, Graham Street, Birmingham. To the commendation then given of a really admirable device, by which the upper half of the screen can be placed in a number of different angles in relation to the lower portion, we now add the accompanying illustration. The joint is definitely locked in position by means of the locking pin A engaging with semi-circular slots BBB in one half of the joint. The predetermined positions are indicated by the spring ball ratchet C, which engages with the recesses DDD in the fixed member of the joint. E is the screen support attached to the dashboard, F

the side member of the movable portion of the screen, and G the centre bolt on which the joint rotates. The device is an effective one, upon the introduction of which Messrs. Neale and Sons, Ltd., are to be congratulated.

SEVERAL well-known motorists have suggested the endowment of "The Automobile Cot" at the children's hospital at East Clandon, Surrey, for the children of drivers of motor vehicles and of workers connected with the motor industry. Subscriptions may be sent to Lady St. Helier, 79, Harley Street, W.; Mrs. Wilson Noble, Tangley Park, Guildford; or the Secretary of the Alexandra Hospital, Queen Square, W.C.

LORD MOSTYN has placed an order with the Daimler Company (through Messrs. Drake and Gorham), for a 30-h.p. chassis with 10½ ft. wheelbase.

THE Eerste Nederlandsche Rijwiel en Machinefabriek (H. Burgers) of Deventer, have been appointed agents in Holland for the Starling and Stuart cars of the Star Cycle Company, Ltd., Wolverhampton.

AN Albion 16-h.p. motor delivery van has recently been shipped to Africa to the order of the Southern Nigerian Government.

THE forthcoming Cordingley Show at the Agricultural Hall is referred to in a Dutch contemporary as the "Automobielenoonstelling."

AT a meeting of the Institution of Civil Engineers, on Tuesday, last Col. R. E. Crompton read a paper on "Modern Motor Vehicles."

MESSRS. BARNETT MOTORS, LTD., of Birmingham, have, we hear, secured the British agency for the Spanish-built cars known as the Hispano-Suiza, which made their debut at the Paris Salon.

IN connection with the recent movement against noisy motor-buses, the Coventry Chain Company, Ltd., inform us that in connection with their roller chains they have adopted a method of increasing silence in chain-driven vehicles.

THE new depot of the Humber Company at Birmingham is at 280, Broad Street—nearly opposite the Bingley Hall. The premises comprise three floors and a basement, and are being fitted up for repair work as well as the display of automobiles.

IN order to secure something like uniformity in the charges for petrol, oil, tyres, and accessories in the automobile trade of Ireland, the Irish Motor Traders' Association has been formed, with Mr. E. M. Stirling, of Messrs. Mann and Overton's, Ltd., Lincoln Place, Dublin, as secretary.

A MOTOR vehicle fitted with the Hartridge tyre has been traversing some of the main streets of London during the last few days demonstrating the non-skidding properties of the tyre. It is being introduced by the Hartridge Tyre Syndicate, Ltd., of 265, Strand, W.C.—opposite the Gladstone statue.

AT the first annual ball of the office staff dinner of the Daimler Company, held at Coventry last week, about 230 ladies and gentlemen were present, and Mr. A. Freeman, the hon. secretary, is to be congratulated on the success of the event. Most of the local motor manufacturing firms and allied trades were represented.

FROM Messrs. Robert Spence and Son, Richmond, Yorks, comes a descriptive circular of the Omnium oil ejector they have recently introduced. It takes the form of an oil can with a long spout; it has a forced feed, obtained by pressure on a thumb button which compresses the air in a plunger, and which will discharge the oil a distance of 15ft. if necessary.

AT the adjourned inquest at Leeds concerning the deaths of two persons killed in the recent motor-car accident in the Roundhay Road in the city, the foreman announced that twelve of the thirteen jurors had decided to bring in a verdict of manslaughter against Mr. Atkinson, the driver of the motor-car. A verdict of "Manslaughter" was therefore recorded. Mr. Atkinson was committed for trial, bail being allowed.

NOW that Elastex is attracting so much attention it is not surprising that other substitutes for air in motor tyres are beginning to make their appearance. Reference has already been made to Kegperton, which has been put on the market in France, while last week Mr. T. Spong, of Shaftesbury Avenue, W.C., showed us a sample of a new substance in which he is interested. Its main feature lies in the fact that in addition to the usual glue, glycerine, and chromic salts, finely powdered rubber enters into its composition, with the object of increasing the resiliency of the tyre. Mr. Spong informs us that, with the view of giving his new product a practical trial, he will be glad to fit it to the tyres of a car of any motorist interested in the new departure, if he will communicate with him.

MR. NORMAN SALMOND has been appointed manager of the West End Depot, 311, Oxford Street, W., of Messrs. H. M. Hobson, Ltd.

THE Star Engineering Company, Ltd., of Wolverhampton, are making fresh arrangements regarding the representation of the South of England, and will be glad to receive communications regarding agency terms.

THE Vapour Emission Competition of the A.C.G.B.I. will be held on Tuesday, March 19th, and the last day of entry will be the 2nd prox.

CARELESSLY throwing down a lighted match after lighting a cigarette, a youth set fire to some petrol and a motor-car was destroyed at Haywards Heath the other day.

THE Windham Detachable Body Co. have removed to 22A, St. John's Hill, Clapham Junction, S.W. The new premises have been specially constructed for body building.

MR. J. W. BROWN, of 10 and 11, Jermyn Street, W., is acting as Capt. Stanley's agent in respect of the automatic change-speed gear described elsewhere in the present issue.

THE corporation of Leicester is making a bold bid to secure the establishment of a motor-car works in the town, and is seeking the assent of the Local Government Board to the sale of a site for the purpose at less than the market value.

The 20-h.p. Crossley Chainless Double Landauet recently supplied by Messrs. Jarrott and Letts to Mrs. Money-Coutts.

The body is arranged to seat four passengers comfortably in the interior and two in front, including the driver.

A COMMITTEE of the Haslingden Cotton Manufacturers Association has been appointed to consider the question of developing a motor service for the cotton manufacturers of the district, on lines similar to those which are being introduced into the Potteries.

A CATALOGUE of their motor engineers' stores comes from Messrs. W. H. Willcox and Co., Ltd., of 23, Southwark Street, S.E. This firm is well known in connection with lubricating oils and greases for motor-buses, vans, wagons, lorries, &c., its "Atlas" motor greases being a speciality of repute. These are made in various consistencies, particular consideration being given to high melting points, thereby ensuring economy with efficient lubrication. In lubricators, pumps, valves, motor jacks, motor kits, safety lamps, &c., many good examples are illustrated and the list is likely to be of service to motorists generally.

MR. A. C. DAVISON, whose works are in Pleasant Row, in the High Street, Camden Town, N.W., has issued a useful catalogue of his motor adjuncts, among which are the Davison petrol and oil gauge fittings. The light car gauge is intended to be screwed to the dash of the car, and is fitted with a tap to shut off the petrol. Other types are made for motor-bicycles, that known as pattern 1A being in the inclined position which, combined with the magnifying properties of the glass, allows the level of the petrol to be seen from the saddle. Mr. Davison's needle valve for the carburettor is another speciality. In this the union of the valve is fitted with a cork washer requiring little force to make it tight and not being affected by grit.

MR. LOVE is erecting large motor-car workshops in Carlyle Road, Kirkcaldy.

MESSRS. JONES AND CO., of Talbot House, Lichfield, are extending their motor garage.

THE Marquis Dumas has placed an order with the Daimler Company for a 28-h.p. 11½ ft. wheelbase chassis.

MESSRS. A. DOWNIE AND SONS are about to build motor-car bodies in large new works in the Townsend Place, Kirkcaldy.

MUCH interest is being taken in Kidderminster in the report that a motor manufacturing firm is about to erect works in the town.

MR. E. R. PICKMERE, the town clerk of Liverpool, is contributing a series of articles on roads in relation to motor-car traffic in the "Local Government Officer."

SOME of the disadvantages of allowing local authorities to control matters of trade importance are seen in India in connection with motor affairs. In the Central provinces petrol can only be transported in two gallon cans; in Bombay and Calcutta four gallon drums are allowed.

MESSRS. MARKT AND CO., of 6, City Road, Finsbury Square, E.C., have become well identified with the business in speed indicators and odometers. In the latter department they have the Veeder device, which can be supplied on the wheel and striker principle or with a gear drive. Fitted either to the dashboard or the axle it provides a strong and accurate instrument for the motorist. The Jones Speedometer that attained gold medal distinction in the speedometer trials of the A.C.G.B.I. is also marketed by Messrs. Markt and Co., who have a wide

range of models from the fifty-mile speed indicator to that which registers up to 100 miles per hour, giving also a distance reading up to 10,000 miles. Their latest introduction in specialities of this class is the combined speed indicator and clock shown in the accompanying illustration. This makes a handsome addition to the dashboard fittings, the clock being mounted in a case to pair with the speedometer. These are some of the specialities with which the firm are most popularly identified, their range of other motor accessories including horns, bells, voltmeters, motor clocks, and similar appliances, distinguished by accuracy and good appearance.

BETWEEN Monday night and Tuesday morning the premises of the Germain Motor Cars, in Hanover Court, Hanover Street, W., were forcibly entered at the rear, and two silver cups (one of which was presented by the Hertfordshire Automobile Club and won by a 14-h.p. Germain last year, and the other, which was presented at Blackpool for the flying kilometre, and won by an 18-h.p. Germain) were stolen.

THE annual exhibition of the American Association of Licensed Automobile Manufacturers has just been held in Madison Square Garden, New York. Altogether there were 265 exhibitors, the car stands being divided as follows:—American petrol machines, thirty; foreign petrol vehicles, twelve; electric, seven; and commercial cars, nine. The balance of the exhibits was made up of tyres, oils, and the thousand and one accessories now being turned out. Messrs. Smith and Son's speed indicator, complete with total mileage and trip recorder, was exhibited for the first time in America at the New York show.

MESSRS. BRANDES AND CO., Coventry, send a circular of their Fulminator magnetos, a special point in the construction of which is the simplicity of all the moving parts. The makers are also devoting attention to the repair and adjustment of all types of magnetos and coils.

MESSRS. GEORGE ACE, LTD., have just opened extensive premises in Swansea with showrooms at 64, Wind Street, and large and commodious garage and repairing works in St. Helen's Road, where every appliance for up-to-date and speedy repairs is installed. The firm have also extensive premises at Tenby and Haverfordwest.

ON Monday next Mr. Frederic Coleman is opening an Edinburgh branch of the White Company at 6A, Devon Place, where he will have a well-equipped garage. A stock of spare parts and several competent mechanics will be kept at this place. A 30-h.p. White steam car will be on exhibition at this depot during the Edinburgh show.

As a result of the negotiations between the Auto-Cycle Club and Motor Union, a satisfactory arrangement, which will be brought before the Committee of each body for confirmation, has been arrived at. A great deal of credit for the satisfactory settlement of the difficult situation is due to Dr. Hele-Shaw, who was proposed by the Auto Cycle Club representatives to take the chair at the Conference, and who suggested methods of compromise which were satisfactory to both parties.

THE value of the motor-cars and parts exported from the United States during the eleven months ending with November last is returned at £833,406, as against only £499,802 in the corresponding period of 1905. Of the total, the United Kingdom is responsible for no less than £222,123, Canada taking the second place with £169,454, and Mexico the third with £135,656.

MESSRS. GLOVER BROS., LTD., have acquired extensive additional premises from Mount Pleasant to Gough Street, near Holborn, E.C. The new garage is for the accommodation of motor-vans, which Messrs. Glover Bros., Ltd., drive, garage, and keep in repair at a fixed price per annum, according to the mileage travelled by the respective vans.

THE Bowden patent wire mechanism is fully explained in the new catalogue issued by E. M. Bowden's Patents Syndicate, Ltd., of Baldwin's Gardens, Gray's Inn Road, W.C., for 1907. This is a profusely illustrated trade list showing the application of the mechanism in connection with brakes for cars, ignition and throttle control for automobiles generally, valve lifters for motor-cycles, auxiliary air regulators, motor-boat control, change-speed gear, &c. It will be useful for reference by motorists generally.

CLASSES in motor-car engineering have been established at the University College, Nottingham, as a means of preparation for the examination for the certificates of the Automobile Club, in addition to those of the City and Guilds of London Institute in motor-car engineering. The second part of the course in motor engineering will deal with speed gears, steering gear, clutches, cooling, lubrication, readjustments, transmission, the chains, and management of cars, &c. The lecturer is Mr. G. P. Mills.

THE road manager of the Automobile Association reports that the Continental tyres fitted on the Association's 6-h.p. Rover car have worn very well. After running about a couple of hundred miles the detachable non-skids were put on. At the end of 2,000 miles the non-skids wore out, but the covers looked as good as ever. Pullman non-skid bands were then vulcanised on, and the car was run for over 3,000 miles with them.

MR. FILSON YOUNG recently drove a 60-h.p. six-cylinder Napier car from the Lizard to London, using the top gear all the way. The first and second speeds were never used throughout the whole journey of 300 miles. On two occasions, however, where he encountered traffic in the middle of a hill and had to stop, Mr. Young ran the car back by gravity to the level, started again on the top gear, and proceeded on his journey. On two other occasions where he took a wrong turning the car was run back on the reverse to the point of divergence, starting again in both cases on the top gear.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### MOTOR LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter from Mr. J. S. Critchley in your last issue raises many points of interest to the motorist in search of the best obtainable results from his machine. The lubricant needed is the one which will reduce friction to an irreducible minimum, and one would think that this would be, as it should be, the buyer's first consideration, but it is frequently his last. Such comparatively unimportant questions as—Will it go through my lubricator? Will it go through too quickly? Will it leak through the joints in the crank chamber? What is the specific gravity? What is the flash point? It is a dark thick oil? Is it a

Mr. Critchley's remarks are, I take it, confined almost exclusively to the first named (and in this I agree with him) for he would not, I am sure, advocate the use of a thin oil for the lubrication of the "big ends" of an 8-h.p. single-cylinder engine, or of a large multi-cylinder engine. It is true that much thinner oils than are generally employed would efficiently lubricate group (a) where the piston was a good fit and the cooling system good, for the thinner the oil the better, so long as the cylinder and piston can be kept apart by a film of oil on the surfaces, but the most efficient oil in this respect would be in many cases inefficient in its application to group (b). There are very few motor-car engines fitted with a system of lubrication whereby different oils can be used, so the oil manufacturer not only has to group the friction places, but group the groups and effect a compromise between the requirements of group (a) and (b) and supply an oil which will give best all-round results. With perhaps the exception of small gas and oil engines, the motor-car engine is the only one where a single oil has to meet these varying conditions, two and sometimes three different oils being employed on a single engine.

The motorist who considers these points would be wise, therefore, to use a lubricant which he has found from personal experience and the experience of others under actual road conditions to meet the twofold

A View of Lieury—one of the little French towns on the course on which it is proposed to hold the Contest for the Coupe de la Presse.

pale coloured thin oil? How much does it cost per gallon? are sometimes allowed to determine the kind of lubricant employed. Lubricator are often bad enough to make the use of the right oil impossible. Others lubricators, capable of adjustment, might take the right oil, if adjusted, yet there are those who will use oil which adapts itself to the lubricator rather than alter the lubricator to feed the right oil in the right quantity.

There are many questions involved when this subject is under discussion, so I will confine myself to the point raised by Mr. Critchley as to whether thin oil is best for the motor. The first thing to consider is that there is a best possible oil for every friction place; that would be too fine a point, so the oil manufacturer who studies the question has to "group" the friction places and make the best possible oil for a particular "group," that is as near as you can go in practice, apart from the experimental shop. There are two most important and totally dissimilar friction places in the motor-car engine, viz. (a) cylinder walls, piston and gudgeon pin, (b) crank shaft bearings, cam shaft and big ends of connecting rods, and to obtain the maximum power output of which an engine is capable it would be necessary to use the best oil for each place. In (a) we have sliding friction with light pressure under considerable heat, and in (b) rolling friction with considerable pressure and comparatively low temperature, and these conditions being unlike need equally careful consideration.

purpose satisfactorily, rather than change to an oil which, theoretically more efficient for one purpose, might be a failure in a dual capacity. Comparatively thin oils always give more efficient results on the testing bench, where there is little oscillation and no excessive vibration, because a very fine film of thin oil will under these conditions (as perfect as they can be made) keep the metal surfaces apart, but such a film would be destroyed on the application of sudden jar or pressure, such as might arise under working conditions; the film would be destroyed, and metallic contact would result.

Another point worthy of consideration is that engines vary just as friction places vary in their conditions. Engines vary in working temperature of cylinder walls, piston speed, compression, system of lubrication, pressure on crankshaft bearings, &c., and to get the accessory dealer to stock lubricants to meet all the different conditions on all the different engines is at present outside the range of practical politics, so we must aim at getting the best all-round results.

I sincerely trust that my letter will not be read into a direct opposition to Mr. Critchley's argument, but, on the contrary, as qualifying his statements, and, if I may say so, carrying his argument a step further, for I am not arguing for either thin oils or thick oils, but for the right oils from a friction reducing and practical standpoint.—Yours truly,

ALBERT E. NEWTON.

## FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There appear to be a lot of claimants for the first six-cylinder motor. I had one running in a boat at the time of the Gordon Bennett race in Ireland, in 1903, and what is more, it had the synchronised ignition. I believe this was the first six-cylinder motor running in this country, at all events with this ignition. The motor was built to my order by Messrs. Brooks, of Lowestoft, and the ignition distributor by Mr. F. C. Blake, of Kew.—Yours truly,

S. ESTCOURT.

## THE CONSTRUCTION OF AN INSPECTION PIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "Rotherham's" question in a recent issue of the *M.C.J.*, after thinking the thing out for weeks, I have recently had a very useful and practical pit placed in my new motor house. The pit itself is of corrugated iron as supplied ready-made by Messrs. F. W. Besant and Co., of Wimborne, Dorset. The size is 7 ft. 3 in. long by 3 ft. wide by 3 ft. deep. Four feet is the stock depth, but mine was purposely made 3 ft., and this proves quite deep enough, as work can be more comfortably done in a sitting position. The upper edge of this metal pit is sunk 3 in. below the floor level, and a ledge, just a brick wide ( $4\frac{1}{2}$  in.), runs along each side. On this ledge solidly rest the ends of a row of 3 in. planks. The pit is itself constructed with iron steps at one end, upon which, as well as upon the floor, wood can be laid.

It is thus self-contained, water-tight, dry, and clean to work in, and, being enamelled white, reflects light well.

My pit has been placed at right angles to the run of the car in such a position that the front (or back) wheel on one side travels just clear of the end opposite the steps. The corresponding wheel thus runs along the full length of one plank only, the other planks being, in every case, removable for access to the pit and the car; whereas if a pit is put lengthways to the run of the car it is often difficult to guide the wheels so accurately as to clear both sides of the pit and the ends of the board. A pit set at right angles requires no such extreme nicety of steering on entrance, nor adjusting by laborious hand-shifting afterwards. Another advantage of this arrangement is that the worker can easily get in and out of the pit at the side of the car, and he is never pinned beneath its full length.

The car can, of course, unless the wheels are off, be shifted forwards or backwards across the pit as the work may require. Should the motor house be very short, the pit can be located nearer the door, or the car can be run in for repair purposes the opposite way to what is usual. I append a rough sketch to make the description clear.—Yours truly,

LEVESON SCARTH.

## SUBSTITUTES FOR PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No doubt you are aware a great deal of interest has been caused recently by the suggestion that Borneo spirit of .760 specific gravity should be used in motor-cars, and if successful it would mean that a very large quantity of spirit could be put on the market at a considerably reduced price as compared with the present American or other petrol. To see whether this really was practical I have had some careful tests made. The Borneo spirit had a specific gravity at 39 Fahr. of .765 as compared with .720 specific gravity at 39 Fahr. of the ordinary Pratt's or Shell spirit. The first test was to take an ordinary six-cylinder Napier car on the road with a standard carburettor as adjusted for ordinary Pratt's spirit. The result of this test was that with the Napier carburettor the Borneo spirit seemed to do equally as well, so far as combustion was concerned, as Pratt's, and combustion was clean and clear at all speeds. The engine throttled as well and ran as fast. If the motor had been running very slowly it did not seem to pick up quite as quickly and undoubtedly the running considerably improved when the engine was warm—that is to say, it appeared that a little more warmth was desirable for the best carburation.

I then had a bench test made, and tried to get the horse-power

that the engine was developing under both tests as near as possible the same. The first test was with a light weight on the brake and the engine developing its power at a high number of revolutions, with the following result:—

The Borneo spirit gave 42-h.p.

The Pratt's spirit gave 42.9-h.p.

With a heavy weight on the brake and the engine developing its horse-power at a slower number of revolutions, the result was:—

The Borneo spirit gave 39.7-h.p.

The Pratt's spirit gave 40.3-h.p.

On the tin in which the Borneo spirit was supplied there is a caution that more air should be used than for ordinary spirit; but, curiously enough, the tests I have made do not seem to confirm this, as in one case 6 more horse-power was obtained without the extra air open, although, curiously enough, in another case under the same conditions the power was 5 horse-power less, so that evidently during cold weather it is unnecessary to give more extra air. The Borneo spirit appeared to vapourise quite perfectly with the engine running in every way as it runs on ordinary petrol.

To sum the matter up, the position is that the Borneo spirit could be used with perfect confidence by users, but when the engine is quite cold it is a little more difficult to vapourise, and the tests undoubtedly prove that we have another source for motor-car fuel, and at cheaper prices than the ordinary spirit.—Yours truly,

S. F. EDGE.

## SMALL STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or some of your readers would oblige me with some idea of the above cars. Not being a wealthy man, I shall have to get a second-hand vehicle, and require information as to what sort would best suit my purpose. First of all, not to carry more than two persons, driver and passenger. Very hilly country, distance about sixty miles daily; fuel, paraffin if possible. I do not want the tedious work of air and water pumping, the torch lighting-up process. I must have one that will stand, say half an hour, without lighting up again. Perhaps some of your readers will give me their experiences, such as:—How long it takes to get up steam, fuel consumption, distance run without picking up water, and, when necessary, can the bucket work be dispensed with; miles per hour, cost of lubricants, for the daily journey mentioned, &c.—Yours truly,

C. BROUGHTON.

## SUBSTITUTES FOR THE HORN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On page 1,017 in your issue of the 12th ult. I note J. H. H. makes a very peculiar statement in regard to the platinum points of electric horns. It is obvious from his letter that he has only tried one particular type of horn, and that he condemns the whole principle of the electric horn on this particular sample which he has used, and that he does not recommend it on this basis. I really must take exception to his remark, because it condemns a system of road alarm which is very prevalent at the present moment, which is taking up very well with the public, which is extremely useful and serviceable, easy to work, has a better sound than the ordinary type of horn, causes less annoyance to pedestrians, horses and live stock on the road, and causes them to make way for the car without showing any undue annoyance. This the writer has had personal experience of.

Your correspondent is evidently unfortunate with his particular type of electric horn. The writer has had a good experience of the Wagner electric horn, which is of the diaphragm type actuated by electric magnet with iridium platinum make and break, and given correct adjustment this make and break is excellent and does not fuse, pit, or give any trouble if the current consumption does not exceed five amps. The current the writer uses with this particular type of horn is an eight volt accumulator, but it gives excellent results with four volts also, but not quite so good as with eight volts. Forty watts consumption may strike the reader as a high consumption, but it must be remembered that the contact is only on for a few seconds at a time and not for any continuous length of time, and that between each moment of use the accumulator has a rest and appreciably picks up current during that rest, and it will easily be seen by this that even a twenty ampere hour accumulator will last a very long time.

However, the point I am writing about and which I am interested in is the platinum points your correspondent speaks about. Taking the Wagner horn as an instance, the contacts on this are made up of 20 per cent. iridium and 80 per cent. platinum, with a face contact of  $\frac{1}{8}$  in., and the platinum itself being  $\frac{1}{8}$  in. deep from the surface of the metals into which they are screwed, and I find that they last some months if cleaned now and again. Of course they pit slightly in the same way that the best induction coils in modern use do. This cannot be helped, as by the passage of the electric current through the points a process of electrolysis is set up, which finally decomposes the surface of the points and they pit slightly. If the surface of the platinum points is not  $\frac{1}{8}$  in. in diameter, but is less than this, and the current consumption is at the rate of forty watts per hour, of course, as the diameter is decreased so the chance of platinum pitting is increased in proportion, by reason of the lesser cross section of the points, so that the trouble of J. H. H. would point to the fact that the platinum points are of a less

diameter than they should be, or that the metal used is not iridio-platinum, but of some inferior substance. For instance, pure platinum gives not nearly such a good result as iridio-platinum. The combination of 20 per cent. iridium with pure platinum gives an extremely hard substance, which has very durable qualities with next to no resistance.

When J. H. H. states that platinum points run into 10s. per week, I am inclined to think he is exaggerating slightly the facts. My iridio-platinum points, for instance, to be fixed cost me at the rate of about 4s. 6d. to 5s., and a pair of these contacts will last many months' ordinary use.

Just a word as to the efficiency of the Wagner electric horn that I am speaking of. As a road-clearer it is unequalled; if the sound obtained from the horn is of medium quality, neither too deep nor too light, it carries extremely well, and by tests I have made carries 50 per cent. further than the best air reed blown horn of the bulb type that I have ever used, and as before stated, it has a very moderate effect on pedestrians, and has not got the startling suddenness of a deep bellowing horn or a clashing, clanging bell, but seems to quietly intimate to them that there is danger.—Yours truly,

S. J. WATSON.

## A SUGGESTED LIGHT CAR TROPHY RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I append a copy of a letter I have sent to British manufacturers of light cars, in the hopes of obtaining their co-operation and support in the organisation of a light car trophy race and with eventually bringing into being what we consider to be a much-desired event.

"As a manufacturer of small cars, would you be interested in the organisation of a light car contest, to be known as the Light Car Trophy Race, to be held on the same lines as the Tourist Trophy Race, and providing the consent of the A.C.G.B.I. be obtained, possibly in conjunction with the same. The Automobile Club having at present no provision for light car trials, and the manufacturer of light cars having to look solely to the Scottish and Irish clubs for the opportunity of making public performances with their cars, I wish to put before you a plan for a contest; which I hope will have your support. My suggestion is as follows:—That all the manufacturers of light cars, who desire such an opportunity, band together, and provide a sufficient stake for the organisation and expenses of the race, including the trophy. That a committee be appointed, which shall consist of one representative from each manufacturer, to arrange the details of the race. Finally, that these details be submitted to the A.C.G.B.I. for approval, and the club be asked to take the race under its auspices and to provide the necessary officials. The race to be run on a road course for the purpose of demonstrating the following points:—Reliability, petrol consumption, freedom from tyre troubles, reasonable speed. If you would be willing to co-operate in such a plan as I have briefly outlined, an early reply will greatly help to advance the movement."

Not only will a Light Car Trophy Race be of great benefit to the trade in general so far as the manufacturer of light cars is concerned, but we are sure that the would-be purchaser of the "car for the man of moderate means" will also derive exceeding benefit, inasmuch as in this way he would have as good a chance of comparing the merits of the light cars as the wealthier members of the community at the present time have for comparing those of the larger and more expensive types. We hope you will invite correspondence and discussion as to the advisability of this plan in your valuable columns.—Yours truly,

A. H. ADAMS.

## INCREASE OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Following always with the greatest interest the columns of this part of the *M.C.J.*, I shall feel obliged if some of the motoring friends could offer me their advice or experience of a Benz car. No doubt there are many who possess or are looking for help towards this particular type of car. It is a great pity that one hears so little of these old cars. If properly rebuilt and improved according to the latest practice, or as near as possible, I do not see any reason why this vehicle should not prove a success.

I dismantled my Benz of 12-h.p., bought a pressed channel steel frame and mounted the engine in front, behind a radiator, and fitted a clutch similar to an external brake which gave a good amount of space for transmitting the power by means of a chain to the gear-box. I also altered the wheels and have now equal front and rear ones of 34 in. As regards the carburettor I may say that I fitted a Longue-mare in lieu of the old one. A new inclined steering column, pneumatic tyres and a nice body have made the car smart looking. As regards power, I am all right on first, second and third speed, but unfortunately I cannot get out anything to please me on the top speed; in fact, it seems to me that the latter ratio of gear does not come up to the third speed. The cylinders are of course perfectly tight, having fitted new rings and new packing. The car itself ought to do much better, considering that the total weight as compared with the original design is much less.

I thought of improving, or, better to say, increase the compression, but the result obtained was rather a negative one and I decided to have the motor pistons as before, i.e., without a packed top. The last improvement I think to make is to fit a high tension magneto, but I am

not sure if this will help me very much, yet I am in favour of same. I cannot see why the third speed pulls well, the top speed not. As mentioned above, the car weighing now considerably less, should under all circumstances drive better.

I may say that I consider the third speed about sixteen miles per hour, and should say that with advanced ignition and magneto a speed of twenty-five to thirty miles on top speed (fourth) must be easily obtainable. The engine of the Benz car is only rated at 12-h.p., but, according to my views, it is underrated.—Yours truly,

MAGNETO.

[Not knowing the ratio of the gears in "Magneto's" car, we should be rather inclined to think that the same were too high for the power of the engine. No doubt an increase of speed could be obtained by speeding the engine up a trifle, this by giving a little more advance to the ignition; but, even then, we doubt if a speed of twenty-five to thirty miles per hour could be obtained. If the same gear ratio is used as fitted to the car previous to reconstruction, it is possible some working part may be causing friction sufficient to hold the car back when on the top gear. We do not think the fitting of a high tension magneto would have the desired effect, although a slight increase might be obtained.]

## NON-FREEZING ENGINE COOLING SOLUTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been interested in the correspondence on the above subject. In my experience with non-freezing solutions, I found the water, alcohol and glycerine solution good till the alcohol evaporated, which depends upon how hot the motor is run. Glycerine in the solution seems to serve the object of helping to keep the alcohol from evaporating so fast, but I found it troublesome to watch and keep up the proper pro-

Lord and Lady Herbert Scott on their 8-h.p. Rover Car.

portion of alcohol. Next I tried a neutral solution of common salt, three-quarter saturated solution, one-quarter water, neutralized by sodium carbonate or sal soda, so that when two pieces of litmus paper, one red, one blue, were dropped into the solution neither would change colour. As an anti-freezing mixture it is good down to any temperature we have had this winter; also, it can be easily replaced even on the road. The solution has proved so handy that I can strongly recommend it for a machine having a circulating system with small exposure of soldered surfaces. The solution does not attack copper, iron, or rubber.—Yours truly,

T. BURNHAM.

## CASE HARDENING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be very much obliged if you, or any of your readers, would let me know the best method of case hardening mild steel. I have tried yellow prussiate of potash, but I find it only faces the metal, while I want something which will bite into it.—Yours truly,

J. LETCH.

[There are two methods of case-hardening, and these are known as open hearth and muffle. The latter is the best, as the results are far more reliable, besides which any desired depth of carbonisation may be attained. Where only a very superficial hardening is necessary, one of the materials is "Scintilla," but failing this the white cyanide of potassium will give fairly good results, and is better than the yellow prussiate. The article must be heated to a clear, bright red and the powder sprinkled carefully and evenly all over the part it is desired to harden. The powder should, especially in the case of cyanide, melt and run over the surface. If extra depth is required, the surface may be scoured and the heating and melting repeated. Quench in clean water,

at a cherry red in the dark. Muffle hardening takes anything from two to eight hours, and the old-fashioned Palfreymans bone black takes a lot of beating for reliable results. However, there are compounds sold which do the work in half the time, one specially good brand being supplied by the Tentonia Steel Works, of Sheffield. Muffles are often now heated by gas.]

### THE STANDARDISATION OF NUTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been interested in Mr. Martineau's remarks on nuts. I have a car by a very well-known firm in the metropolitan area, on which there are at least eight different sizes of nuts and unions. Even worse is the fact that four of the nuts, unions and plugs are  $\frac{3}{8}$  in.,  $\frac{1}{2}$  in.,  $\frac{5}{8}$  in.,  $\frac{3}{4}$  in., for which I have, of course, been unable to purchase spanners. Surely motor manufacturers might try to do a little better than this. A good set of box spanners will not take all the nuts.—Yours truly,  
R. HARRISON.

### VIBRATION AND LEAKY RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having noticed some correspondence in your and other journals respecting the leakage of honeycomb radiators, which is attributed to vibration of cars, I take the liberty of asking readers of the *M.C.J.* whether it is not a fact that the vibration on some cars is greater than on others.

Mr. J. Burnaby Atkins, of Tonbridge, on his 15-h.p. West Car.

Perhaps this is due to the balances of the engine or the true working of the same, as I know that honeycomb radiators made exactly alike, and tested to the same pressure before leaving the works, soon leak on some makes, whereas in other cases out of large numbers supplied no reference to this trouble has been heard. This appears to be answered in the affirmative, as shown on scores of motor-omnibuses now running in London and the provinces with pieces of tin soldered in place of the honeycomb tubes.—Yours truly,

INTERESTED.

**CATALOGUES WANTED.**—One of our Australian readers, Mr. F. G. Hill, 398, Riley Street, Surry Hill, Sydney, writes that he will be glad if manufacturers of motor-cars will send him a copy of their catalogues.

**INNER TUBE FOUND.**—One of the men employed by Messrs. R. Ranger and Co., Bower's Roller Mills, near Guildford, has picked up the inner tube of a motor tyre, which will be returned to the owner on sending particulars of the same.

**FOUR V. SIX CYLINDERS.**—Since our last issue we have received no less than three letters from Mr. S. F. Edge on the subject of four v. six cylinders which we regret we have not the space to publish. One is in reply to Mr. C. Jarrott, the second gives a copy of a communication addressed to Mr. Forest asking if the latter's six-cylinder engine was fitted to a motor-car. The third deals with Mr. A. Elsworth's letter, in which the latter states that the Spyker six-cylinder car was shown at the Crystal Palace in February, 1904, and was the only one on view. Mr. Edge gives conclusive proof that a six-cylinder Napier car was shown on the same occasion, and points out that an illustrated description of the vehicle was given in the *M.C.J.* of February 13th, 1904.

## CLUBS AND ASSOCIATIONS.

### MOTOR UNION.

THE MOTOR UNION AND MOTOR EXHIBITIONS.

THE Motor Union has made arrangements whereby its members are admitted free of charge to certain motor-car exhibitions on presentation of their current cards of membership. The list includes the shows at Glasgow, Newcastle, Edinburgh, Manchester, Sheffield, and the London, the latter being Cordingley's Exhibition at the Agricultural Hall from April 6th to April 13th.

### MOTOR YACHT CLUB.

A DEFINITE challenge has been received for the British International Cup from the Motor Boat Club of America, on behalf of the commodore of the club, Mr. Edward J. Schroeder, who proposes to bring his well-known racer "Dixie" over to try and lift the trophy. The date of the race will probably be somewhat earlier than last year, and will most likely take place during the last fortnight in July.

### LINCOLNSHIRE.

THERE was a good attendance at the annual meeting of the Lincolnshire A.C. on Saturday at the Great Northern Hotel, Lincoln, Sir H. B. Bacon presiding. The accounts showed a bank balance of £100, and the Committee report a very successful season in every way.

Sir H. B. Bacon was re-elected president, Mr. C. Nelson solicitor, and Mr. Godfrey Lowe was re-elected hon. secretary. Earl Yarborough was added to the vice-presidents, and the vacancy on the committee caused by the regretted retirement of Mr. W. B. Jevons was left for the committee to fill.

The revised rules for club competitions, in which the trade is barred in the club competitions, were passed, as well as a rule to arrange for competitions open to all members. Suggestions were made as to hill-climbs, speed contests, &c. Mr. Lowe announced that the arrangements for the meeting of the Motor Union in May, at Lincoln, are as follows:—The meeting will be held in the morning in the City Guildhall. In the afternoon the cars will go in procession from the Great Northern Railway Station Yard to Canwick Hall, a mile away, when the members will be entertained by Mr. M. R. W. Sibthorp. In the evening the public dinner will be held in the County Assembly Room, followed by an informal conversazione.

### BRADFORD.

THE second annual dinner of the Bradford A.C.—a branch of the Yorkshire A.C.—was held at the Victoria Hotel, Bradford, on Wednesday of last week.

In proposing "The City and Corporation of Bradford," Dr. Campbell said the roads in the place were moderately good, and that the local authorities were one of the earliest to utilise motor-cars. The Mayor, in acknowledging the toast, said motor-cars had heralded the advent of a new form of pleasure and industry in the country, and he hoped it would prosper and still increase in utility and pleasure. So far they had had very few cases in the police court with motorists. When Bradford motorists wanted to get into trouble they seemed to visit some other district. The local Technical College recently started a motor class for the teaching of youths in the city in automobile matters.

Mr. Tom Mitchell, in toasting "The Automobile Club of Great Britain and Ireland," said that he was practically a new convert, but at the same time his experiences were varied—on the car, in the air, and on the road. Mr. C. P. Wilson responded. He said he thought that by the tactful administration of the Automobile Club they were to a certain extent outliving the question of public prejudice. If they could find some adequate and practical solution of the dust problem the public would have really very little to grumble at. He was glad to say that this question was at last being tackled, and the competition which had been promoted for tar-spreading machines should show the public that the motorist was alive to the fact of the dust nuisance.

Mr. E. H. Hepper toasted "The Motor Union." That body had done excellent work, and he regretted that Bradford with over 700 motor-cars registered was not more strongly represented in its membership. Mr. S. Neumann replied.

Mr. S. S. Dixon submitted "The Automobile Association." Col. Bosworth said that a little while ago it was customary for motorists to bow their heads to the storm in the hope that police and occasionally magisterial prejudice would soon pass away, but it was found that the more they submitted the greater liberties were taken. As a body of sportsmen working for the benefit of sportsmen, the Automobile Association had inaugurated a system of scouts, extending over practically the whole country. In this county, although the police were Yorkshire, and therefore astute, the scouts would be Yorkshire too. He denied the statement so often urged that motorists were working against

the police. A man who drove recklessly through a town or a village deserved all he got, but occasionally the police were prejudiced.

Mr. Amos Crabtree, in toasting "The Yorkshire Automobile Club," said it was one of the largest in the kingdom. There were 270 members, and the number was constantly increasing. The club, amongst other things, arranged speed and reliability trials and races and pleasure trips. Mr. G. Learoyd, in acknowledging the toast, strongly condemned the "road hog." Mr. G. H. Kent toasted "Our Guests," to which Mr. Stenson Cook replied.

### SCOTTISH.

SUPPLEMENTING the report of the annual dinner of the Scottish A.C. at Glasgow, which reached us as we were going to press last week, we may refer to the speech of Mr. T. P. O'Connor, M.P., in proposing the toast of "Automobilism." He said that in Scotland and in Ireland there were many regions which were remote from the general railway system of the country. He was sure the people of these remote regions in both Scotland and Ireland had reason to bless the day when it was possible that they could be opened up both for travel and for commerce by the agency of the motor-car. He was sure that every agency—and he put the motor-car as one of the greatest of these agencies—which opened up scenes of beauty and resort in Scotland to all the world was a great benefit, not only to Scotland, but to every visitor who came to their beautiful country. Motorists had, of course, had a great many troubles and difficulties to meet. Let him say that some of these difficulties had been created by certain unworthy members of the craft to which they belonged. The man who drove his motor-car to the disregard of the health and convenience of the public was not only an enemy to the public but was in, a particular and special degree the enemy of the amusement and of the industry with which he was associated. That man, he was glad to say, was not typical but exceptional in the automobile ranks; but he would be in favour of any legislation that would put a curb on such persons, and that would make them amenable to justice. He belonged to a body of opinion that strongly thought that the freer and more frequent the intercourse between all people—between different nations, between different classes and grades of the same nation—the better for all concerned.

Colonel Holden, vice-chairman of the A.C.G.B.I., made a reply. Progress, he said, had been so rapid that one could hardly realise that it was only in the short space of ten years that what was practically a mass of machinery without any sort of carriage on the top had developed into the luxurious carriage of to-day, with most of the machinery hidden away. To the Scottish Club, and in particular to the president of the Scottish Club, a great deal of the progress and interest in automobilism in the country was due.

Professor Archibald Barr proposed "Municipal and County Administration," to which Lord Provost Bilsland replied.

Lord Dunedin, the Lord Justice-General of Scotland, proposed "The Scottish Automobile Club." In every contest, after all, he said, the extreme votaries of one side or the other had rarely turned the battle. It was all very well to say that motoring had come to stay, but the question for them was—Was it going to stay under anything like comfortable conditions? He was perfectly certain that the cardinal sin of the motorist was inconsiderateness. It was perfectly possible to drive a motor-car so that it would not be any trouble to any man, woman, or child. Depend upon it, it was only by the influence of a Club like this being exerted to make members considerate that they would get automobilism to be a pursuit that did not excite any rancorous feelings on the part of the great majority, which, after all, did not possess, and would never possess, a motor.

The Chairman, Sir J. H. A. Macdonald, K.C.B., who acknowledged the toast, said he rejoiced to claim the credit of being the first judge in the British Isles to drive from his home to his circuit, to hold his circuit, and be back in time for tea in the afternoon. The future rested with themselves. The Scottish Club had prospered beyond their highest expectations under the guidance of a man whose modesty was only equalled by his energy and his skill, Mr. R. J. Smith, their secretary. We had in this country an industry which would turn out cars quite as good and trustworthy as could be got from abroad. He was afraid it was one of the snobisms of our country that we always thought a French silk or a French lace or French anything was better than anything we could get in this country. Although a car with a French name could be bought at enormous expense, they could get as good an article here. During the last year we had imported from abroad no less than £4,371,000 worth of articles connected with automobilism. He hoped that would soon cease. Clubs ought to do as much as possible to encourage their own local industries, which were doing splendid work both in England and Scotland. It was the automobilist that must be the greatest power for the improvement of our roads. If the Government would only just have the boldness to expend five millions of money in grants for improving the roads, and seeing they were put in proper order, the value to the country in wealth would exceed that by five or six times in a few years. Let them try to convince their friends that upon the establishment of good roads lay the future of a great addition to the prosperity of the country, and a great step towards the ultimate success of automobilism.

Sir John Ure Primrose proposed the toast of "Our Guests," which was acknowledged by Treasurer D. M. Stevenson. The toast of "The chairman," proposed by Mr. H. M. Napier, concluded the proceedings.

### CARDIFF MOTOR CLUB.

THE annual meeting of the Cardiff Motor Club was held at the Queen's Hotel, Cardiff, last week, with Mr. C. J. Thistle (president) in the chair. The secretary's report was adopted as follows:—"The end of its second year finds the Cardiff Motor Club in a very satisfactory condition both financially and numerically. The club has no liabilities, and, although the balance in hand is small, this is likely to be increased within the next few days by the receipt of the few subscriptions outstanding from last season. The club, if not quite so large as last year, is composed now of active members, who take a keen interest in the competitions promoted by this and other clubs. The fact that the Cardiff Club is affiliated to the A.C.C. should induce many motorists to become members, if only for the legal protection afforded by the Motor Union. The competitions organised during last season by the committee included a hill-climb at Penttyrch in May, and speed-judging competitions in July and September. The hill-climb, as usual, attracted a large number of spectators, and some fast times were recorded. The speed-judging contests were very enjoyable; the extremely low rate of speed of the competitors caused amusement to the villagers and stupefaction to some of the constables.

### Cylinder vs. Seating Accommodation

The "One-lunger," a family turnout actually used toward the close of the last century. From an old print. The "Wholly Seizable," a four-cylinder "car," in which the people of 1906 "enjoyed" their outings.

The eight-cylinder runabout, prevalent about 1907. The rumble seat was then considered

The twelve-cylinder runabout of 1908, which established two the ideal number for carrying capacity

The 1909 model, which gave over the entire chassis for the accommodation of its twenty-four cylinders

A hobby specimen of the 1910 model—forty cylinder, double deck, in the modern poop deck chair.

A Page from a "Show Number" in the Year 1910

[Motor Way.

Commenting on this, the Chairman remarked that there seemed to be a general impression that the club was one for motor-cyclists only. That was entirely wrong. It was a club for car-owners also, and its membership numbered nearly as many car-owners as cyclists.

Officers were elected as follows:—President, Mr. W. J. Hilborne; captain, Mr. H. Haddon; sub-captains, Messrs. A. Williams, Edward Owen, and C. Collard; hon. treasurer, Mr. H. B. Jotham; hon. secretary, Mr. G. W. Blackaller.

### NOTTINGHAM.

LAST week, at Newark, Captain L. l'Estrange entertained a number of motorists at supper at the Clinton Arms Hotel, among those sitting "down" being: Messrs. Charles Hardy, H. Belcher, R. Cripps, W. D. Foster, J. C. Wilson, W. D. Wells, M. McCraith, B. W. Winter, A. R. Atkey, M. Ross Browne, C. Poyser, A. Poyser, H. C. Wright, P. Maltby, J. P. A. Long, J. H. Clarke, J. J. Armitage, R. M. Wright, J. R. Senior, W. Mumby, P. Richardson, H. Bowden, W. J. Dexter, Henry Bircumshaw, C. E. W. Lucas, G. Butcher, A. King, S. H. Hill,

Dr. Buckley, H. Rimington, S. C. Hardy, E. Fewkes, L. A. Thominet, A. Metheringham, J.P., H. C. Roe, W. Stevens, C. E. Norris, and Booth Granger (hon. secretary). After supper had been partaken of, during which a telegram regretting his absence was read from the Mayor of Newark, the company adjourned to a concert room, where the proceedings quickly resolved themselves into a concert, with Mr. C. Hardy in the chair.

In proposing a vote of thanks to Captain l'Estrange for the hospitable manner in which he had entertained the members, the Chairman said that the large number who had attended the meeting showed the great interest which was taken locally in the automobile movement, and it also showed the flourishing condition of the club. The idea of holding meetings in various parts of the county was to induce automobilists to become members of the club, and in this respect those who had already joined could do much in maintaining the past growth of the membership. It was only by one member co-operating with another that the club's influence could be enhanced. It was the first county meeting the club had undertaken, and they were all deeply indebted to Captain l'Estrange for the way in which he had worked for its success. Mr. C. E. W. Lucas seconded the proposition, and in responding Captain l'Estrange expressed the pleasure that the meeting had afforded him, and hoped it would not be long before the visit was repeated.

### DERBY AND DISTRICT.

THE 5th annual meeting of the Derby and District Automobile Club was held at the Royal Hotel, Derby, on Thursday of last week, Dr. J. A. Southern presiding. The annual report stated that Mr. G. A. Strutt was retiring this year and joined with the committee in their unanimous desire to propose Mr. Francis A. Bolton as president for 1907. The committee were glad to report that the membership now stood at 162, a very satisfactory increase on the previous year. The balance at the bank was £53 5s. 7d., an increase of £24 16s. 7d. Members were specially asked to point out to their motoring acquaintances, who were not yet members of the club, that it was the duty of all motorists to belong to the Motor Union.

The election of officers resulted as follows:—President, Mr. F. A. Bolton; vice-presidents, Lord Burton, Sir Peter Walker, Major R. F. Ratcliff, M.P., Messrs. G. A. Strutt, A. J. Clay, C. R. Crompton, John Grettton, John Hall, R. Knowles, H. H. Raphael, M.P., C. L. Schwind, J. B. Marsden Smedley, R. H. Tennant, and E. Vaudrey; committee, Dr. W. G. Coestake, Messrs. E. H. Fryer, L. P. Mell, W. A. St. A. St. John, R. W. Sale, Frank G. Smith, C. R. Hewitt, and Dr. J. A. Southern; hon. auditors, Messrs. E. Collumbell and J. Simkiss; members of the Motor Union Committee, Messrs. C. J. Allin, C. T. Leech, F. G. Smith, and L. P. Mell; hon. treasurer, Mr. C. Turner Leech; hon. secretary, Mr. Charles J. Allin.

### HERTFORDSHIRE.

THE adjourned annual general meeting of the members of the above club was held at the Euston Hotel, London, on the evening of the 30th ult. Mr. C. McWhirter was in the chair. The business of the meeting was to receive and adopt the report and accounts of the last year's working, and to elect nine new members of the committee. The chairman briefly reviewed the past work of the club, its present position, and its prospects for the coming season. The past year had unquestionably been the most successful since the foundation of the club in 1904. It had increased its membership from eighty at the beginning of the year to 150 at the end of December, and there were several candidates before the committee for election to membership.

The result of the ballot for the committee was that the following nine gentlemen were elected:—Rev. W. A. Errington (Ware), W. G. James (Bushey Heath), T. Thornycroft (Chiswick) F. R. Bircham (Boxmoor), F. W. Shorland (Watford), S. Saker (St. Albans), C. Poston (Stevenage), E. H. Arnold (Watford), and H. W. Colliver (Boxmoor).

A committee meeting was afterwards held, when Mr. Ernest Webster was elected chairman, in succession to Mr. C. McWhirter, and Mr. W. Whittall, who was hon. secretary during 1904 and 1905, was re-elected to that office in place of Mr. T. Williams, who had been compelled by pressure of business to retire.

ALDERMAN E. T. COOKSEY presided at the annual dinner of the Worthing Sailing and Motor Boat Club, held last week. Dr. Le Riche humorously suggested that as the club progressed it might become known in the future as the Worthing Sailing, Motor Boat and Aeroplane Club.

ON Monday, the 11th inst., the Right Hon. J. H. A. Macdonald, K.C.B., will read a paper on the organisation of motor transport for national defence, at the Royal United Service Institution, at Whitehall, S.W., at 3 p.m. Members of the Motor Union or of automobile clubs will be admitted on production of their cards of membership.

A MEETING of the Institution of Automobile Engineers will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., on Wednesday next, at 8 p.m., when a paper will be read by Mr. Walter Rosenhain, of the National Physical Laboratory, on "The Strength and Structure of Alloys."

MR. TOM BROWNE has presented the Automobile Association with a sketch for the menu card of the A.A. second annual dinner, which will be held on Tuesday next, at the Hotel Cecil.

## THE FUTURE OF THE MOTOR-BICYCLE.

BY ARTHUR CANDLER.  
Hon. Secretary of the Motor Cycling Club.

MR. CHAS. JARROTT, in his speech at the Auto-Cycle Club dinner, dealt with the future of the motor-cycle and threw out some hints to manufacturers as to the lines on which they should work if they wished to see motor-bicycles in more common use than they are at the present time. Indeed, he went so far as to say that had the makers worked on different lines from what they are now doing there would have been ten times the number of motor-cyclists at the present time. At the outset he drew attention to the small horse-power of motor-bicycles manufactured six or seven years ago, and he mentioned in connection with the Paris-Bordeaux race, that Mr. Edge and himself were riding bicycles which were, at that time, looked upon as huge monsters, being 2½-h.p. Now, motor-cycling in this country dates back to 1901. It is true that previous to that date there were a few people who were riding motor-cycles, but the public did not commence to invest in any number till 1901, and the bicycles then manufactured were from 1½ to 1¾-h.p. They were only suitable for strong healthy persons, for, although they ran well enough on good hard, level roads, still the amount of muscular effort needed to get them up moderate hills was exhausting, and altogether too much for any but the most robust. This prevented the public from taking to them in large numbers until the horse-power was considerably increased, and during the last two years many thousands have taken to motor-cycling because of the increased power without a corresponding increase in price.

The most popular machine for 1907 will undoubtedly be the 3½-h.p. motor-bicycle, and it is well to bear in mind that a high-grade 3½-h.p. bicycle actually costs less than did the 1½-h.p. machine of six years ago. It may be true that in years to come the development of the industry may permit of lighter bicycles being made, but it is really remarkable how the present powerful bicycles, which only weigh 150 lb., can stand the terrific strain they have to undergo when travelling over our rough roads. I do not think it will be safe to cut down the weight to any appreciable extent. Mr. Jarrott discussed the matter as if it was necessary, or at any rate desirable, that the motor-bicycle should be so made in weight, horse-power, and ease of manipulation that it should be possible for anyone not actually confined to a bed of sickness to be able to indulge in this sport.

My own opinion differs considerably from Mr. Jarrott's. There are, I suppose, in this country about 2,000,000 persons who own an ordinary bicycle. Out of that large number there are very few so feeble that they would not be able to manipulate the present motor-bicycle, and those few would not buy any motor-bicycle, however light in weight or cheap in price. The question therefore arises, how many people own motor-bicycles? I should put the figures at about 40,000, and would ask whether Mr. Jarrott is correct in stating that ten times that number, or 400,000 persons, would have been motor-cyclists at the present moment if our manufacturers had proceeded on the lines he indicated, viz., the keeping of weight and horse-power down to such an extent that even the delicate could manipulate them. It is not too much to say that 90 per cent. who are now likely to go in for motor-cycling would prefer a machine that would be strong enough and powerful enough to enable them to travel over any part of the British Isles where there was a carriage road. The present 3½-h.p. machine is just about right for this purpose if we bear in mind that the roads are not always dry, that the wind is not always favourable, or non-existent, and that some of the finest parts of the country are found in hilly districts. Well, we have some 40,000 owners of motor-cycles. This is but a small proportion of the 2,000,000 who own ordinary bicycles. But what proportion of these 2,000,000 will ever be likely to have cash enough to spare for the capital outlay and upkeep of a motor-bicycle? I do not think it would be safe to put the figures at more than 20 per cent., or say 400,000. If 40,000 be anywhere near correct as an estimate, then I think it remarkable, considering the youth of the industry, how well it has progressed to have reached that number of owners of motor-cycles, and it is safe to say that this advance has been due to the sensible lines on which manufacturers have proceeded.

Finally, what is it Mr. Jarrott really desires? Is he dissatisfied with the reliability of the present motor-bicycle? Surely not, as it has been proved over and over again to be capable of keeping up 100 miles and more a day with very little trouble and expense. Does Mr. Jarrott think that the cost of running a motor-bicycle is at present too high, and can be cheapened by the manufacturers? Surely not, for almost the only expense with the exception of tyres is that of petrol and oil, items that manufacturers have nothing to do with. Is it weight he wishes to see reduced? Surely not, for with the rough roads one often meets with, it would be unwise to unduly lighten our present machines. Is it horse-power Mr. Jarrott wishes to see reduced? It would seem so from his speech, but it has been proved over and over again that nothing under 3-h.p. is of use under the varying conditions the motor-cyclist meets with from day to day. Of course, in the distant future some new discoveries may be made that may revolutionise motoring. Meantime, manufacturers are quite right to develop on present lines, rather than keep for another generation the delights of motor-cycling. I cannot agree that efforts should be made to so design the motor-bicycle that it will be a suitable machine for everybody, however young, however old, however infirm. If manufacturers tried to design on these lines, retrogression would take the

place of progression. Mr. Jarrott seems in favour of some light motor that can be attached to the ordinary bicycle and switched on fast when the rider felt tired of pedalling, or when reaching a stiff hill, or when the wind was unfavourable, or when the road was in an exceptionally heavy condition. But it is just under such circumstances that something more than a small-powered engine is required, and there are few, if any, who have tried the light pedal-assisted motor-bicycle who will agree that such are desirable. I think that one of the greatest mistakes that can be made is to try and combine the ordinary bicycle with the motor-bicycle. Any attempt to use the bicycle for both purposes must prove a ghastly failure.

Let us by all means go in for improving our present excellent motor-bicycles, but let us beware of proceeding too hastily or we may put the industry backwards by efforts which will render the machines less reliable and less efficient.

Just one word or two about the motor-tricycle, whose claims for consideration were advanced by Mr. Jarrott. I was rather surprised at this when coupled with his other remarks, for except for the most robust, and on the smoothest of roads, I consider motor-tricycling about as bad a form of sport as can be indulged in, if good health be desired. Let the average individual try it regularly for a few months on the roads round about London and he will emerge from the experiment a shattered wreck.

### PUBLIC MOTOR SERVICES.

At the meeting of the London and South Coast Motor Service, Ltd., Mr. Carlton Roberts, the chairman, said the concern was the first company formed to supply a speedy motor coach. It was of a special design invented by the managing director, Mr. J. W. Cann, and fitted with a six-cylinder engine by the Thames Ironworks Co., Ltd. When their service was fully equipped they would be able to run passengers from London to Brighton at practically third-class railway fare, and quicker than at least twenty-seven trains that do the journey daily from London Bridge. The receipts so far had exceeded their estimates. Adding together all the days run by their coaches, supplemented by the cars they purchased, they have had equivalent to one car running one year and one hundred and fifty-three days; that is, all the days that all the cars were running total just one year and one hundred and fifty-three days, the total receipts for the one coach for this period of five hundred and eighteen days being £2,228 3s. 4d. Such should give a good return in the future. Revenue would also accrue from the royalties received from other firms desirous of building motor coaches from their designs. At the present time they had eight coaches and four garages—one each at London and Ramsgate and two at Folkestone. The success achieved on the Folkestone and Hythe route showed that the south coast was favourable to the company's enterprise. The adoption of the report having been carried, an extraordinary general meeting was held, when authority was given for the issue of preference capital.

THERE is a prospect of the revival of the motor-bus at Bolton. Some time ago the Corporation experimented with certain vehicles, but, owing to the suggested adoption of a type unsuitable for the hilly district, the effort was abandoned.

At least three municipal and other authorities are seeking powers to run motor-buses in connection with their tramway undertakings, viz., the corporations of Rawtenstall (Lancs.) and Sheffield and the Northfield Urban District Council.

In their report presented to the Westminster City Council the Works Committee state that they have had before them accounts for repairs to public lamps damaged by motor-omnibuses and other vehicles. In eleven out of the nineteen cases before the committee the owners offered to pay half the cost in settlement, and the town clerk, in consultation with the solicitors, has accepted the offers.

SIR, CHARLES McLAREN, the chairman of the Metropolitan Railway Company, has been lamenting the keen competition of motor-buses on the Baker Street and Willesden section of his line.

THE consideration of the proposal to establish a motor-bus service for Alfreton has been deferred for a short time.

In their last report the directors of the Central London Railway (the Tube) show a decrease in the number of passengers carried amounting to 4½ per cent. They explain that competitive services of motor-omnibuses are now running over the whole route of the Central London Railway, and have doubtless diverted many short distance passengers from the line.

### THE M.M.C. CARS REDIVIVUS.

OLD motorists will be glad to learn that the well-known M.M.C. cars are shortly to make their re-appearance. Mr. Alfred Burgess having just issued a circular announcing that, after prolonged negotiations, arrangements have been satisfactorily completed for the reorganisation of the Motor Manufacturing Company. A new company—"The Motor Manufacturing Company (1907), Limited," has been registered with the moderate capital of £40,000, the whole of which (with the exception of the amount of cash, £5,000, paid to the Official Receiver), will be available for working capital and general purposes of the company. The new company will acquire the whole of the old company's assets (with the exception of the Motor Mills and fixed plant at Coventry), direct from the Official Receiver for £5,000 in cash and £7,500 in 5 per cent. debentures. The book debts and cash taken over by the new company will approximately equal the cash payment of

£5,000, while the remaining assets acquired are valued for a going concern at nearly £50,000. Some time ago the Daimler Company purchased the old Motor Mills and fixed plant at Coventry from the Receiver, and since that time the business has been carried on at temporary works at Parkside, Coventry, and at 151, Wardour Street, London, W. These temporary works will now be vacated and the business will be removed to and carried on at the new M.M.C. Works, Clapham, which have been specially laid out as a motor-car manufactory, and a lease of which the new company has acquired on favourable terms. A feature in connection with the new company is that all its shares will be issued for cash, and no intermediate profit whatever will be made. This position is due to the fact that some of the largest customers of the old company are interesting themselves in the reorganisation of the new concern, and are, themselves, so satisfied with the excellence of the M.M.C. cars, which they have used for years, that they are guaranteeing a considerable amount of the requisite working capital to enable the company to immediately resume the manufacture of high-class cars.

### MOTOR-CAR ACCIDENTS.

A VERDICT of accidental death has been returned at the inquest at St. Austell, Cornwall, on the body of Mr. J. E. Veale, J.P., who died as the result of a motor-car accident. Mr. Veale was in the car with a friend who was driving, and a chauffeur. The night was dark, and the car getting near a ditch Mr. Veale and the chauffeur were thrown out. The chauffeur had several ribs broken, and Mr. Veale died from compression of the brain following concussion.

A SHOEMAKER, named William Hawkins, age 65, has been killed at Slough by a motor-car. The old man was crossing the Great Bath

A Show Room at the New Premises of the Motor House, Euston Road, London, N.W.

Road when a motor-car going in the direction of London knocked him down. His skull was fractured, and he died shortly afterwards in a surgery. The driver of the car sounded his hooter, and steered the car to avoid deceased, but Hawkins, who was slightly deaf and near-sighted, walked straight in front of the car.

A SERIOUS motor-car accident occurred in Stockport Road, Manchester, recently. In endeavouring to get clear of a wagon, which unexpectedly emerged from a side street, Mr. Norman Crossland, of Higher Broughton, who was driving his motor-car, jammed down his brakes; but the tyres of the car skidded; and, after it had run into a tramcar, it dashed against a brougham. The carriage was overturned, and the occupants, Dr. Sandbach Scott and Mrs. Scott, were thrown under it.

As a shooting party consisting of Mr. G. L. Cripps and Mr. George Nixey, both of London, were proceeding up a steep hill at Easton, near Newbury, in the former's motor-car, the vehicle began to run backwards. The brakes would not act, and the car rushed for a distance of 150 yards, when it ran up a bank and overturned. Mr. Cripps had jumped off and Mr. Nixey was thrown clear, but the chauffeur was pinned beneath the car. It was nearly an hour before it was possible to lift the car, and then the chauffeur was found to be dead. Mr. Nixey was badly hurt about the head, while Mr. Cripps is suffering from serious internal injuries.

At Bow Street (London) Police Court, Otto Lipfert, a German chauffeur, employed by a firm of motor-car manufacturers, has been charged with causing bodily harm to Walter J. Wells, by driving a motor-car in a furious and wilfully negligent manner in the Strand. The Earl of Clancarty was a passenger at the time. Since the first police-court hearing the injured man has died in the Charing Cross Hos-

pital. At the inquest the jury at first returned a verdict that the death of Mr. Wells was caused by being knocked down by a motor-car negligently driven by the chauffeur. The Coroner explained that this verdict would be tantamount to one of manslaughter, whereupon the jury again deliberated, and, receiving the permission of the coroner, withdrew the verdict given, and substituted for it one to the effect that the chauffeur had driven negligently, but that he had not been criminally negligent.

WHILE out scouting in the early hours of Monday morning two members of the Legion of Frontiersmen met with a serious motor accident at Redhill. Mr. M. Lynch, of Reigate Hill, a pensioned officer of the Cape Mounted Police, who is a lieutenant of the Legion, was in command, and was accompanied by Mr. Hugh Hughes, of Reigate, a trooper, who is the owner of a motor-car and acted as his own chauffeur. Running into Redhill the car collided with a lamp-post. The force of the collision was so great that the tonneau was wrenched from the chassis, and the front wheels were jammed into the back wheels. Mr. Lynch was pitched clean out of the car and fell on his head some fifteen yards away. He was picked up unconscious, his skull being smashed in. He was removed to his home, where he now lies in precarious condition. Mr. Hughes was pinned down by the steering-gear, and fortunately escaped with only slight injuries. The car was completely wrecked.

### ARMY MOTOR RESERVE.

Lieut.-Colonel Mark Mayhew, commanding the corps, has been granted three weeks' leave of absence, with permission to travel in France, and has arrived at Nice after a splendid run from Havre on his 40-h.p. Napier car.

The Staff Tour, which General Lord Methuen, commanding Eastern Command, intended to carry out in the vicinity of Newbury, and in connection with which no less than ten officers of the A.M.R. had been detailed for duty, has been postponed till April next.

The "Full Dress" uniform to be worn by the officers of the Army Motor Reserve has been approved by His Majesty. It is practically the same as that worn by officers of the late Motor Volunteer Corps, with the substitution of gold for silver as regards lace and ornaments, and is an exceptionally neat kit.

Amongst the names of the ten officers appointed to the corps during the past month are those of Captain R. V. Webster, City of London Imperial Yeomanry (Rough Riders), and Lieutenant E. C. Herdman, North of Ireland Imperial Yeomanry. Officers of the Imperial Yeomanry and the Militia may be appointed to the Army Motor Reserve without being called upon to relinquish their commissions in the Auxiliary Forces.

An instructive staff tour, in connection with the Cavalry School, Netheravon, conducted under the supervision of the commandant of that establishment, was held last week. The "general idea" was that a hostile force, having scattered our fleet, had successfully landed cavalry at Bournemouth and Weston-super-Mare, and commenced to reconnoitre. The English Home Army had mobilised, and the cavalry brigade had been ordered to push forward towards the two landing places and report upon the general position of affairs. The following officers of the Army Motor Reserve were detailed for duty during these operations, Captains O. H. Bayldon and H. M. McAllister, and Lieuts. J. Peyto Shrubbs and J. R. Benson, and were employed by Colonel the Hon. J. E. Lindley, Major Saunders, R.F.A., Major Laurie, D.S.O., and Captain Browne, R.F.A. During the tour the cars covered an average of 100 miles daily, and the necessity of the automobile as a means of conveyance in the conduct of military operations with a frontage so extensive was fully realised by all concerned.

### ROAD REPORTS.

NEWTON BANK.—The attention of the County Council has been called to the dangerous state of the corner at Newton Bank, where many accidents have occurred at the foot of the hill. On Saturday a cyclist on his way to Whitechurch was killed through colliding with a trap at the corner.

NEWMARKET.—The ten-mile an hour limit for motor-cars is now in operation on the Bury Road and a portion of the High Street, Newmarket.

DARTMOUTH.—The roads in the neighbourhood of Dartmouth are rather hilly and some of them narrow. Generally speaking they are now in good condition and are being much patronised by motorists. The fine stretches of roadway on the sea coast are a great attraction.

EASTBOURNE.—The roads undergoing repair in this district are the Willington main road as far as the borough boundary and the Eastdean road, leading to Seaford. The main roads proposed to be repaired shortly include Seaside and Terminus Road.

BOURNEMOUTH.—Ordinary repairs to the roads are being carried out in Bournemouth and the surface is immediately rolled by steam roller, a policy that ought to be universal.

HASTINGS.—No road repairs of any magnitude will be carried out at Hastings during the present month.

WEST SUSSEX.—The West Sussex County Council has decided that "all the repairs to be carried out to main roads for the ensuing year, of a length of 100 yards and upwards, be carried out by the using of tar and two inches of material."

## CASES UNDER THE MOTOR-CAR ACT.

### NO REAR LIGHT.

The employee of a motor-car works at Accrington has been summoned for driving a motor-car without having a rear light attached. He was also charged with being drunk while in charge of a car. The former case was dismissed but a fine of £2 and costs inflicted for the second offence.

### RECKLESS DRIVING.

At the Bingham Police Court, Gilbert Kennedy, of Liverpool, was summoned for driving a motor-car at a pace and in a manner dangerous to the public, at Holme Pierrepont, on January 17th. Speaking for the defence, Mr. Lucas pointed out that the prosecution had to rest on mere opinion. In this instance defendant had been to Lincoln buying beasts. On leaving the Fosse Road he got on to the Tarmac, and there he saw a cart in front of him. He immediately slowed down, putting on the brakes, without knowing that he was on Tarmac. Then the car skidded. Defendant himself thought there would be an accident in consequence of the extent to which the car skidded. The Bench considered that the charge of driving at a speed dangerous to the public was proved, although they did not think it a bad case. A fine of £3 would be imposed.

### COMPANY NEWS.

#### NEW COMPANIES REGISTERED.

MANSFIELD MOTOR BODY COMPANY.—£2,000. 61, Leeming Street, Mansfield.

MANCHESTER MOTOR TRANSPORT COMPANY.—£10,000. To take over the business carried on by Mr. J. Mather, as receiver for debenture-holders of Manchester Motor Transport Company, Limited, at Chester Street, Manchester. First directors: Messrs. W. G. Killick and C. B. Nixon. £100. Grove Works, Ashworth Street, Manchester.

IRIS CARS.—£12,000. Agents for the sale of motor vehicles, motors, and parts thereof, &c. First directors: Messrs. A. Dugdale, R. T. Deane, and A. E. Perman (managing director).

JOHNSON, HURLEY AND MARTIN.—£5,000. To take over the business of mechanical and electrical engineers, manufacturers of and dealers in motor engines and parts, &c., carried on by Messrs. G. Johnson, D. H. Hurley, and J. R. Martin, at Coventry, as Johnson, Hurley and Martin, Alpha Motor Works, Gosford Street, Coventry.

CENTRAL MOTOR GARAGE (HARROGATE).—£4,000. To acquire the business of manufacturers of and dealers in motor-cars and lorries carried on by Mr. A. Davies at Harrogate. First directors (Messrs. J. H. Wilson, A. Davies, W. Peacock (managing director), and W. Edmondson. 1, Station Square, Harrogate.

AUTOMOBILE WHEEL COMPANY.—£4,000. Agreement between Messrs. W. H. Pritchard of first part, O. R. Mounsey of second part, H. J. Mounsey and B. E. Jollands, trading as Robert Roy and Co., of third part. First directors: Messrs. H. W. Pritchard and B. E. Jollands.

BAKER STREET MOTOR-CAR BAZAAR.—£3,000. The Baker Street Bazaar, Baker Street, W.

A.B.C. MOTORS.—£10,050. 31, Broad Street Avenue, E.C.

COLIN DEFRIES.—£5,010. To acquire and deal in automobile chassis and motor-cars and vehicles of all kinds, especially the chassis manufactured by the Societe Generale des Automobiles Porthos; with a view thereto to acquire from Mr. Colin Defries the exclusive rights to sell and dispose of such chassis in Great Britain and British colonies and dependencies, vested in him under an agreement between himself and the said Societe. First directors: Messrs. M. H. Seton Karr, C. Defries, D. C. Defries, and one other to be appointed by subscribers for preferred ordinary shares.

### THE STORAGE OF PETROL.

At the West London Police Court, Francis Lannier, of Holland Park Avenue, Notting Hill, has been summoned, before Mr. Lane, at the instance of the London County Council, for infringement of the licence under which he was entitled to keep petroleum on his premises. One of the conditions of the licence was that in the yard only two gallons of the spirit should be kept, and that in the workshop only one quart should be kept, the same to be stored in a metal vessel with a closed cover. On the occasion of the visit of the inspector two gallons of the petroleum were found in the workshop, and a quart of the spirit in an india-rubber solution in a vessel. The defendant pleaded that his work required him to keep more than one quart in the workshop. The magistrate, in imposing a fine of £5, said the breach of these regulations might lead to disastrous results.

### MOTOR-CAR AND TRAMCAR.

At Westminster County Court Mr. Boothsby sued the London County Council for damages sustained through a collision with a tramcar. He was driving his car on July 6th towards Chatham from London, and he said when he reached the junction of the New-Cross Road, before any warning could be given, a tramcar rushed into his car, and dragged it back some seven yards. Judge Woodfall gave judgment for the plaintiff for £17, the amount claimed.

## THE GLASGOW MOTOR SHOW.

THE second annual motor show in Glasgow was opened in the Drill Hall, West Princess Street, on Friday of last week, by Lord Provost Bilsland. Altogether there are about forty stands, and, although the principal makes of cars are on view, there is no striking novelty, as has been the case at the exhibitions lately held in Birmingham and Liverpool. One of the largest stands is that of Argyll Motors, Ltd., the cars on view including a 14-16-h.p. touring vehicle and a 16-20-h.p. limousine. The exhibit of the Albion Motor Car Co., Ltd., comprises a 24-h.p. Albion polished chassis, a 24-h.p. double landaulet, and a 16-h.p. char-a-banc. The latter, which has a seating capacity for fifteen passengers, has been built for the Gareloch Motor Service Co.; it is provided with a canopy and side curtains, and solid rubber tyres are fitted to the road wheels. The St. Vincent Motor and Cycle Co., Ltd., Glasgow, display a 24-30-h.p. St. Vincent car; this is fitted with an Aster four-cylinder engine, Krebs automatic carburettor, and Eisemann high-tension magneto ignition, accumulators being provided as a reserve. Ball bearings are used to all parts with the exception of the engine, the car throughout being built in accordance with the most recent practice. On this stand is also to be seen an 18-22-h.p. double phaeton known as the Scottish-Aster, a St. Vincent 14-h.p. 20 cwt. delivery van, and a 12-14-h.p. landaulet.

The Western Motor Company, Ltd., Glasgow, have on view a number of Argyll cars, among which is a 14-16-h.p. town carriage in which the motor is located under the driver's seat. The wheel base of the car is only 6 ft. 9 in., enabling the vehicle to be turned in a small circle. At this stand are also to be seen examples of the latest 20-h.p. and 40-h.p. Delaunay-Belleville cars. Examples of the Humber 15-h.p. and 30-h.p. four-cylinder cars, all fitted with side-entrance bodies, are to be seen on the stand of the Scottish Auto Company, Ltd., Glasgow. Messrs. Gibbon

## THE CRYSTAL PALACE MOTOR SHOW.

THE motor-car exhibition opened at the Crystal Palace on Friday, the 1st inst., although of but small dimensions, is notable for the appearance of at least two French cars new to this country, and for a few other novelties, reference to which will be found below. One of the largest stands is that of Messrs. Friwell, Ltd., whose display comprises a range of the well-known Peugeot cars, as also examples of the Westinghouse, Humber and Baby Friwell vehicles. A new car to this country is the Lion Peugeot, a neat two-seated vehicle fitted with a 6-h.p. single-cylinder engine and side chain transmission. An illustration and description of this interesting car was given in the *M.C.J.* of December 8th last. Messrs. Brown Bros., Ltd., in addition to motor-cycles and a range of accessories, are exhibiting two models of the well-known Brown cars, a 10-12-h.p. double-cylinder with two-seated body and a 20-22-h.p. four-cylinder side entrance double phaeton. Hornet Cars, of Berners Street, London, W., exhibit on the stand of Mr. J. F. Janes, of Sydenham, one of their 8-10-h.p. two-seated cars; the engine, which is of the vertical double-cylinder type, drives through a planetary gear giving two speeds and a reverse, the final transmission being by a centrally-located chain to a live axle. Mr. J. F. Janes also gives prominence to a range of Star cars and also exhibits a 24-30-h.p. Rochet-Schneider. A new detachable rim as well as a novel all-rubber non-skid are also to be seen at this stand. The High Holborn Motor Agency, of 158, High Holborn, W.C., are present with several of the 10-12-h.p. New Leader cars, including a chassis, a two-seated car, a tonneau and side-entrance double phaeton. The motive power is supplied by an engine comprising four separate cylinders; the valves are operated off a single cam shaft, and the water circulation is on the thermo-syphon system. The transmission is through a leather

A General View of the Glasgow Motor Show.

and Co., Glasgow, show three Rover cars of 6-h.p., 8-h.p. and 16-20-h.p. respectively. The latter vehicle is fitted with a four-cylinder engine, the crankshaft of which runs in ball bearings. The body is of the side-entrance double phaeton variety fitted with Cape cart hood and front glass. The Daimler vehicles, 28-45-h.p. and 30-55-h.p. Daimler cars, with different types of bodies, are exhibited by the Rossleigh Motor Company, Ltd. The Wolseley-Siddeley, Mercedes and Panhard cars are displayed by Messrs. Rennie and Prösser, Ltd., Glasgow; the Germain and Berliet by the McGeoch Carriage and Motor Company, Paisley. The exhibit of the New Arrol-Johnston Co., Ltd., includes a 12-15-h.p. double phaeton, a 24-30-h.p. landaulet, a 12-15-h.p. van to carry 20 cwts., and a two-ton lorry of the same power. The Ridley Motor Co., Ltd., Paisley, exhibit a neat little 7-h.p. two-seated car, in which the change-speed gear is combined with the bevel drive to the rear live axle. A useful light delivery van on a similar chassis is also on view. Other cars on view include the Spyker, Reo, Sunbeam, Minerva, Darracq, Bell, Chenard-Walcker, Clement, Alldays, Gladiator, and Airex.

Petrol engines for motor-boat use are displayed by several firms. Messrs. Durham, Churchill and Co., of Sheffield, show their special friction clutch, as also examples of their reversing gear for motor-boat work. A useful motor-car house, complete with repair bench, &c., is exhibited by Messrs. Terrace and Co., Glasgow. Messrs. H. F. Spencer and Co., are present with the collapsible and telescopic luggage carrier for motor-cars which has already been illustrated in the *M.C.J.* The tyre exhibits comprise the Dunlop, Elastes, Clincher and Gaulois, while among the non-skids are the Parsons and the Samson. The exhibitors of motor accessories include Messrs. W. Barton and Sons, Edinburgh, Messrs. S. Smith and Sons, Ltd. (speed and mileage indicators), Messrs. Leckie, Graham and Co., Glasgow, and Messrs. James Thomson and Son. The show closes to-day (Saturday).

clutch, three-speed gear-box, cardan-shaft and bevel-gear to a live axle. Messrs. A. Meier and Son, of Redhill, show two specimens of their motor carriage bodies, one being a double phaeton on a 14-18-h.p. Spyker chassis, and the other a luxurious landaulet on a 25-h.p. B.A.C.S. chassis. The cars shown by Mr. Douglas G. Cox, of West Norwood, include the Unic, the 15-h.p. four-cylinder Ford Junior, a Climax, an 8-h.p. Prima, in which the gear-box is combined with the engine, and a 10-12-h.p. Horse Shoe, a new live axle vehicle of French construction.

The principal object of interest at the show is the new Wicksteed change-speed gear. It is shown fitted to a 15-h.p. Humber car by Messrs. Charles Wicksteed and Co., Ltd., engineers, Kettering, who have been at work at it for more than a year past. The gear is of the type in which the various pinions are always in mesh, the requisite pair being made to drive by means of clutches, these latter being of the metal cone variety in place of the dog form ordinarily used. The two shafts are not only parallel, but in the same horizontal plane. Running the whole length of one side of the gear-box is a miniature crank shaft to which small connecting rods are attached. The opposite ends of the latter are fixed to discs formed in one with the male portions of the clutches. These are carried in special screw-threaded supports, corresponding threads being formed on the body of the clutch. Only a slight movement is required to engage or disengage the clutches, this being obtained by the arms and the screw threads just referred to. The side shaft is only brought into use for the first, second, and reverse speeds, the top one being a direct drive. The gear is controlled by a small hand wheel working above a dial plate on the top of a vertical column at the side of the steering pillar. The dial is lettered in the following order: Neutral, low, middle, and fast speeds, and as the wheel can be turned in any direction or continuously one way, the gear can be changed with a minimum of trouble, without it being necessary to withdraw the main clutch. The

reverse is operated by a separate small lever on the vertical column, the gear having first to be put in the neutral position. In the course of a short trial on a 10-12-h.p. Coventry-Humber to which the gear has been fitted, and which has already run over 9,000 miles, we found it fulfils all the claims the makers advance for it. Not only is the change from one speed to another made without shock, but in descending hills all gears can be disengaged, allowing the car to "free-wheel" or coast. The gear runs very quietly, and is simply operated, the action being such that there is no danger of straining the engine or mechanism in changing speed, while the trouble of stripped gears is entirely obviated. Quite a new idea in steering motor-cars is exhibited by the Rotary Steering Syndicate, Ltd. It is shown fitted to an electrical cab, which it is claimed can turn in a 14 ft. circle. The front part of the chassis is of special construction, taking the form of a circle 3 ft. 6 in. diameter. Below and above it are other circles, the lower one being connected to the front springs, axle, and wheels; the upper ring forms a pulley on which runs a steel wire cable by which the lower circle is operated. The steering is controlled by a wheel mounted on an inclined column in the usual way, its movement in either direction being transferred to the upper horizontal pulley. The fixed circular portion of the chassis is provided with horizontal and vertical rollers which serve to keep the lower circle in place and to facilitate the operation of steering. The principal advantage of the gear, which the makers state can be fitted to any car, lies in the fact that it enables a motor vehicle to be turned in its own length. While it is doubtless capable of doing this, the arrangement is such a radical departure from standard practice that no opinion as to its merits can be expressed until we have given it a trial.

A new non-skid tyre known as the Vivian is exhibited by the Vivian Non-skid Tyre Company, of Tudor Street, E.C. It differs entirely from the usual type of non-skid, consisting simply in building up the outer cover of the tyre with alternate ribs of light and dark rubber which vary in resiliency—the dark being firmer than the very resilient light portions. It is claimed that the tyre, in revolving, reaches the point of resistance with the ground, the light portion of the rubber taking such a form against the dark that it provides a fulcrum, which prevents dragging and helps speed. Other advantages advanced for the construction are, that the tyres wear evenly, and that they throw up less dust and mud than the ordinary type. Messrs. Drummond Bros., Rydes Hill, Guildford, make their debut at motor shows with a display of light machine tools suitable for motor-car repairers and motorists who do their own repairs. Other exhibitors include Price's Patent Candle Company (oils and greases); the South British Trading Company, Ltd., Vindex motor-cycles, 20th century lamps and motor accessories; Messrs. Davies Bros., the Stepney spare wheel; Enterprise Motors, Croydon, Riley tri-cars; Messrs. Woodgates Bros., Tiverton, motor tyre patches; Messrs. Stuart, Stuart and Base, motor clothing; and Messrs. Cox and Duffin, Sydenham, De Winter's speed indicator. Motor-cycles are exhibited by several firms, while a new feature of motor-car exhibitions is the presence of a large number of second-hand cars. The show closes to-day (Saturday), but on Monday and Tuesday next Messrs. Friswell, Ltd., will hold an auction of second-hand vehicles.

### THE CALORIFIC VALUE OF FUEL.

MR. A. DUCKHAM, giving evidence before the Fuels Committee of the Motor Union with regard to the calorific value of fuel as a test of its value, said it would be unwise to talk of the calorific value of fuel without realising that it is not the heat that is of use, but the expansion due to the heat and to the chemical reaction. He could give reactions in which the further oxidation of carbon monoxide to carbon dioxide causes a diminution in volume, although, of course, the rise of temperature probably causes the volume to be greater, notwithstanding the water cooling of the cylinder walls. The equations illustrating this statement are:—

from which it can be seen that in the first a negligible volume of carbon unites with one volume of oxygen, giving two volumes of carbon monoxide—i.e., the original volume is doubled; whereas, from the second equation we see that two volumes of carbon monoxide unite with one volume of oxygen yielding only two volumes of carbon dioxide. This reaction, Mr. Duckham considers, might explain the fact that the best results are obtained on a car when the petrol is in excess of the quantity required for the formation of carbon dioxide, and he would like to see on the test bench whether the best results were not obtained when exhaust gases contain a large proportion of monoxide.

He suggests that a series of distillation tests should be carried out to endeavour to standardise in some way the present supply, and so give the user a specification of quality in place of specific gravity. The "paper evaporation" test is an advance on that of specific gravity—but, unfortunately, the method is inaccurate—the result varying so largely, according to atmospheric conditions. In addition to the above distillation test for standardisation, it would be of great value to have experiments made authoritatively on a high-speed internal combustion engine, tested on a bench with accurate dynamometrical measurements, using the present form of carburettor to discover whether or not it is possible to obtain with heavier spirits equally good results as with a light spirit.

### BOYS v. MOTORISTS.

AN action was brought at Clerkenwell County Court against Mr. Abrahams, a surveyor, of Stroud Green, on behalf of a little boy named Molz, of Muswell Hill, for £20, as damages for assault and illegal detention. The boy stated that he and two lads threw some acorns, not stones, at the wheels of Mr. Abrahams's motor-car. The latter stopped his car, pushed the boy and his companions inside, and took them to the police station. Mrs. Molz said that for a week after the occurrence her son trembled to such an extent that he could not write. He suffered from sleeplessness, and in the night she heard him cry out "Bobbie! Run, run! He is after us! He will catch us!" Mr. Abrahams, the defendant, said that stones were thrown by the boys. One stone struck him in the chest, another struck the side of the car, cutting the enamel, while another struck the chauffeur. As one boy was picked up he dropped a handful of stones. The boys would not give their names and addresses, so he told the chauffeur to drive them to the police station. The jury found in favour of the plaintiff—damages one farthing. No order was made as to costs, and Judge Edge said that he quite concurred in the verdict. The decision governed two similar actions brought on behalf of the other boys. Mr. Staplee Firth appeared for the motorist.

### A MOTORIST'S SUCCESSFUL COUNTERCLAIM.

BEFORE Judge Bray and a jury, in the Birmingham County Court, William Brooks, of Yardley, brought an action against Percy Day, Gravelly Hill, to recover £15 for damages caused by the negligent driving of a motor-car by the defendant. There was a counter-claim for £13 15s. 6d. for damage to the motor-car. Mr. Dorsett appeared for the plaintiff (and Mr. Blewitt, of Blewitt and Co., Birmingham) was for the defendant. Mr. Dorsett having stated the case and evidence having been heard, the defence was that the trap was on the wrong side of the road, and that the plaintiff was driving at an excessive speed, estimated by the defendant at twenty miles per hour. Defendant said that in his opinion the plaintiff was to blame for the accident. The driver of the tram and other witnesses expressed the opinion that the pony ran into the motor-car. The jury found for the defendant on the claim and the counter-claim, and judgment was entered accordingly.

### POLICE TRAPS.

NOT often of late has the news of police traps reached us, but one has just been discovered in Derbyshire, being operated by the Clay Cross police. Care should be exercised between Tapton and Stretton, on the Chesterfield-Derby road.

THREE constables confessed before the Arundel County Bench, on Monday, that they were in the Upper Worthing road, in the parish of Poling, a few days before, for the purpose of timing motor-cars.

WE learn from Mr. C. Jarrott that his firm have secured the British Agency for a French two-seated car fitted with an 8-10-h.p. single-cylinder engine and three direct speeds. Mr. Jarrott has given one of the vehicles an exhaustive trial, and states that he was amazed at the extraordinary results attained as regards speed, hill-climbing capabilities and freedom from vibration. Although he does not give us the name of the vehicle in question, we believe it is the Sizaire-Naudin, of which an illustrated description has already been given in the *M.C.J.*

WE had a fifty-mile trial run last week on a 35-45-h.p. Maudslayi car over a give-and-take road in the Midlands. Although the car carried a load of six passengers, all ordinary hills and short stiff rises were taken without change of gear, and a speed of 45 miles per hour can easily be attained. In descending a steep incline the brakes were applied and brought the car to a standstill in a very few yards. The car is particularly sweet in its running when on the third speed, which is the direct drive, and even on the indirect fourth the quietness is well maintained.

ALWAYS on the look-out for novelties, the latest introduction of Messrs G. T. Riches and Company, of Store Street, London, W.C., is a neat little self-igniting pipe, cigar and cigarette lighter. It is of a size that can be carried in the vest pocket, and comprises two small cylinders joined together; one contains a wick which has to be kept saturated with methyl alcohol; attached to the cap of the other is the igniting device, which consists of several platinum filaments. On placing these in the wick tube they become incandescent and so ignite the wick, giving a flame from which the pipe, &c., can be readily lighted. Those motoring lovers of the fragrant weed will find the Sedrop lighter, as the device is known, a welcome substitute to the ordinary match, which is of little or no use when travelling on a car.

## COMMENTS.

ONE of the largest dinners yet held in this country in connection with the automobile movement took place in London on Tuesday, under the ægis of the Automobile Association—a particularly virile organisation of motorists that has rapidly advanced into a leading position. It has appealed to the popular interest in a more pronounced degree than any other society, and while its relations with other bodies are entirely amicable and friendly, it has found a sphere of usefulness in doing the work hitherto left undone. In the south it has made the roads comparatively passable for motorists, and in the north has been

recognised as a valuable adjunct to ordinary police supervision of the highways. At the present time it has established a scheme for naming the villages throughout the country—a piece of Post Office work that has been inadequately done in the past. These and a good many other useful phases of the work were enumerated by Colonel W. J. Bosworth, whose admirable chairmanship of the Association has been a valuable factor in its onward progress. To have gained 3,000 members within the short time it has been in existence is an achievement of which the committee may reasonably be proud.

### A Motor-Car for the South Pole.

A NEW British South Polar expedition will leave this country towards the end of the year under the command of Mr. E. H. Shackleton, who was third lieutenant on the *Discovery* during the national Antarctic expedition under Captain Scott. The expedition will proceed to New Zealand, and thence to the winter quarters of the *Discovery*, where the shore party will be landed, the vessel returning to Lyttelton to avoid the risk of being frozen in. In the following year she will return to pick up the explorers. The expedition hopes to land a party at Mount Melbourne to attempt to reach the South Pole, but its main object is to follow out the discoveries made on the Southern sledge journey from the *Discovery*, to create a new furthest south record, and to reach, if possible, the geographical South Pole. Besides dogs and Siberian ponies for sledge travelling over the ice a new feature will be the use of a motor-car suitable for an ice surface. This will be built by the Arrol-Johnston Company, who are now working on the designs.

### Roads for Motoring.

THE article by Colonel W. J. Bosworth, which appeared in our issue of the 2nd inst., will doubtless serve to suggest a subject for correspondence from our readers, who, as the touring season approaches, will be comparing notes as to the resorts to be visited by motor-cars during the present year. In this connection it may be useful to note that Mr. F. G. Hindle, an active member of the North-East Lancashire Automobile Club, declares that there are no roads in such a bad condition as those of his portion of the country. Mr. E. H. Bailey, who was a few years ago prominent among the ranks of motor tourists, believes that the best roads are in Staffordshire

and Derbyshire, while from Essex comes the view of Mr. E. E. Bentall that the London and Ipswich road has his preference so far as that district is concerned; at least after passing Romford. Unfortunately, the motorist from London finds the journey to Romford of such a character as to almost cause him to forego the pleasures that lie beyond. On this subject of good roads, an expert, who has had much experience of a really practical character, and who knows England from the motor-car as well as from the map, informs us that, in his opinion, the roads of Gloucestershire, Hertfordshire, Staffordshire, Nottinghamshire, Worcester, and the Midlands are the best, in the order stated. The high roads of the first-named county are particularly good, having been made with a fifteen-ton roller. A great point in road making is in the compression of the material, and here, we are afraid, some of the local road surveyors need a little education from their more scientific confreres.

### A Deputation to the L.G.B.

Now that Parliament has resumed its sittings we may expect a revival of the questioning of Ministers which formed such a fruitful basis for attacks upon automobilism in the last session of Parliament. In fact, there is little doubt that some of the more embittered opponents of the motor-car movement intend entering on a vigorous campaign. Hence we are glad to learn that the Motor Union is arranging for a deputation to Mr. John Burns, the President of the Local Government Board, on the subject of the new motor-car legislation which the Government cannot much longer delay. Although there is a general feeling of security with regard to the future, it would be even more satisfactory could prospective motorists be assured as to the reasonableness of the laws under which cars are to run. In this view the trade will readily acquiesce, and should not be slow in assisting the Motor Union in its well-timed direction of policy.

### Motor-Car Imports and Exports.

THE New Year has opened with a further increase in the importation of foreign motor-car productions into Great Britain. The number of vehicles which reached this country during January is returned at 447, their value being given as £181,250. Parts were responsible for an additional £163,727, which gives a total of £344,977, as against only £311,990 in the corresponding month of last year, and £186,186 in January, 1905. Turning to the exports of British motor-cars and parts, these also exhibit a very satisfactory increase. The number of cars shipped in January was 175, of a value of £66,050, while parts accounted for a further £37,099, the total of £103,149 contrasting with only £65,093 in the first month of 1906 and £33,070 in January, 1905.

### Motor-Cars and Defence.

THE interest of the Lord Justice-Clerk of Scotland in automobilism and in volunteer matters is well known, so that in dealing with the question of the Organisation of Power Traction on Roads for National Defence, at a meeting of the Royal United Service Institution on Monday, Sir J. H. A. Macdonald was speaking on a subject on which he is an acknow-

ledged authority—from whatever point of view it is regarded. He pointed out that a railway service corps could not always be depended on to do what was needful when wanted for rapid and effective concentration. Having considered all the difficulties of the situation, he did not hesitate to say that it would be easier, quicker, and more convenient in the case of it being necessary to move troops and their munitions and matériel of war during the first days of, or resistance to, invasion, to employ road power vehicles for the service of conveying the infantry, with all requisites for its efficiency and maintenance, leaving the railroad free for cavalry, artillery, and bulk matériel, and also for ordinary traffic, so as to interrupt business as little as possible. At the present moment there were in this country more than 120,000 vehicles on the road moved by mechanical power, and to add to these there were many thousands more standing ready for delivery, and many thousands more in the hands of second-hand dealers, a large proportion of which were quite efficient.

Mr. Reginald Lassen at the wheel of the 40-h.p. "Weigel" Car with which he has just left England to tour in the United States, on behalf of Weigel Motors.

#### Some Practical Figures.

CONTINUING to establish his claim for the motor vehicle in connection with national defence, Sir John Macdonald said there were nearly a thousand motor-omnibuses in London, and there would be at least 2,000 by the end of the present year. Assume that only 1,500 could be made available, and putting the load at the modest figure of thirty men, these 1,500 vehicles could in six journeys convey 275,000 men over equal distances in thirty hours. Double the distance, and the journeys must be halved; but even that would mean the movement of 137,500 men for fifty-two miles in one day, the proportion of men being in proportion to the mileage to be run. Nearly 45,000 men could be conveyed 180 miles, if necessary, in one day by the 1,500 omnibuses. Of course, forces conveyed by fast-going motor-cars could do double the distance at least that the omnibuses could accomplish. There would be in London and the neighbourhood at least 10,000 such vehicles, which, at a low estimate, could carry 40,000 men. Road transport for goods by mechanical power was also rapidly increasing, and such goods wagons could on emergency carry large numbers of men as well as matériel. If it was possible to utilise promptly and efficiently these power vehicles, in the event of a national emergency arising, the advent of the motor road vehicle had added enormously to our defensive power—a conclusion to which all military authorities are steadily advancing.

#### Speed of Motor-cars in Surrey.

At the quarterly meeting of the Surrey County Council on Tuesday a resolution was passed to the effect that the maximum speed limit should be twenty miles an hour for light motor-cars, and that between sunset and sunrise the maximum speed should be fifteen miles an hour, provided that in towns and villages and at dangerous corners, steep hills, and similar places where caution was required, such reduced speed prescribed by the local authorities should be adopted. An amendment, moved by Sir William Chance, chairman of the Guildford County Justices, for the abolition of the speed limit as recommended by the Royal Commission, was defeated. In the course of the discussion it was stated that the abolition of the speed limit would result in an increase of the dust nuisance and an increased cost in the upkeep of the main roads of the county, which at present cost £5,968 annually to maintain. The council, on the recommendation of the Highway Committee, decided to inform the Local Government Board that they were of opinion that the difficulty of dealing with the dust problem was governed by (a) road construction and (b) construction and speed of cars, and that with the present state of information on those heads they were not prepared with any remedy specially applicable to the roads of the county of Surrey.

#### The Question of Commissions.

THE Automobile Club intends during the present month to bring the new Act relating to commissions clearly before the notice of members, and to point out the desirability of preventing this new law becoming a dead letter through custom. The members will be asked to inform their motor servants that the acceptance on their part of a commission from a motor repairer or from a supplier of motor requisites, or from any other person, will not be tolerated; and further to notify their tradesmen of their attitude in this respect. It is to be hoped that this energetic action on the part of the central organisation will be generally supported. So many dubious transactions have already taken place that scandals have arisen even in an industry so new as that of the motor-car. The new Act has undoubtedly had an influence in many directions, and we trust its effect will be speedy and sure so far as the automobile business is concerned.

#### The Future of Aerial Navigation.

LECTURING to the graduates of the Institution of Mechanical Engineers, on Monday, Dr. H. S. Hele-Shaw said that for many years it was dangerous to a man's reputation even to talk about the matter of aerial navigation, much less to attempt any experimental work in connection with it. But things had changed, and aerial navigation need not now necessarily be associated with mental aberration. Experiments in aerial flight unquestionably surpassed any other form of sport. As for the commercial aspect, it seemed quite certain that flying machines could never carry even light and valuable freights at anything like the present rates of water or land transportation. Neither were passengers likely to be carried with the cheapness and regularity of the railways. But with regard to aeroplane experiments, M. Santos Dumont had proved it possible to fly a distance of a few hundred yards, at a height of about ten feet above the ground, against the wind, in a machine heavier than the air. If, therefore, aerial navigation could ever become a practical and mechanical certain means of locomotion at a cost that was not prohibitive (and he could see no reason why the construction of aeroplanes need be unduly costly), no words of his were needed to point out the stupendous social and economic issues the conquest of the air must involve. Following the prophecy of Dr. Hele-Shaw, we may mention that the progress that has been made is really greater than is generally known, and that emphatic demonstration on that point will be made at the Aero Club's forthcoming exhibition in connection with the Motor-car Show at the Agricultural Hall, London.

**"Reigate Welcomes Progress."**

Now that the Reigate County Bench has apparently supported the style in which Inspector Jarratt deals with motorists who pass his way, we may expect further arrogance on the part of the Surrey police. Without going into the technicalities which were involved in the case heard on Saturday and reported on another page, we must express surprise that even a Surrey bench of magistrates should hear such a confession from the police without a word of reprimand. The inspector admitted that he threatened to knock down a motorist with whom he was having an altercation. This surely is not upholding the dignity of the law nor the self-restraint of its defenders. If inspectors go cycling about the country threatening to knock down anyone who disagrees with them, we may expect constables and sergeants going a step or two further and administering a kind of rough justice without recourse to the ceremony of the courts. The incident as revealed at Reigate is certainly an unsavoury one, and although the County Bench did not publicly tell Inspector Jarratt to

rested upon the blue-jackets from the "Terrible" and the Russian soldiers. He admired the Russian soldier, was not very fond of the Japanese, and preferred the Chinese.

**The Re-treading of Tyres.**

NOT everyone has an idea of the extent of the business that has lately developed in connection with the re-treading and repair of motor tyres. Some motorists have had unpleasant experiences in this connection, but we are pleased to learn that the course of action recently taken by ourselves has done much to eradicate certain unsatisfactory aspects and has enabled those firms capable of doing work that is intended to last to secure a large share of the business that is going. It may be as well, however, to point out to motorists desirous of renewing the strength and usefulness of their tyres that they must not expect too much. No really sound re-treading can be done unless the canvas is thoroughly cleared of the old rubber—a factor in the cost as well as the efficacy of the work. Therefore unless they are prepared for some little expense they need not expect firms

Blue Jackets as Chauffeurs.—Some of the Crew of H.M.S. "Excellent," at Portsmouth.

(Cribb Southsea.)

hold restraint upon his tongue, we trust an intimation will be conveyed to him that such language is not calculated to uphold the authority of the police—in Surrey or anywhere else.

**A Motorist's Adventures.**

THERE is less excitement with the motor-car in a country like our own than being "with the firing line and through the jungle." Mr. Frederic Coleman can talk equally well on all such points. On Friday of last week he went to Nottingham at the invitation of the local automobile club, and gave an account of his experiences as a war correspondent in the Hispano-American war of 1898, the Philippine insurrection, and the Boxer campaign of 1900. Not everyone who knows Mr. Coleman as a faithful friend of the steam car is aware that he went to Manilla as a volunteer. Subsequently he explored portions of the South Sea Islands where no white man had been before, and the pictures he showed of the quaint inhabitants of the region and the wonderfully luxuriant vegetation were specially interesting. He then dealt in detail with the operations in China. At the time of his arrival the work of defence

of repute to undertake such work, for few things are so likely to displease the motorist as the collapse of good expectations with regard to tyres.

**Benzole as a Motor Fuel.**

MR. W. A. BOWER, who has been giving evidence before the Fuels Committee of the Motor Union, has every confidence that unwashed benzole can be made suitable for motor work, as by distilling out the lighter portions of the crude benzole the bulk of the sulphur compounds may be eliminated. As an auxiliary source of fuel to petrol it would be valuable, for it may be fairly assumed that 25,000,000 to 30,000,000 gallons of benzole may be recovered in this country from the gas produced at coke ovens or carbonising works. A larger supply of air is needed to give complete and efficient combustion of benzole in the motor than is found necessary for petrol. The approximate heat values of one gallon of benzole and one gallon of petrol are:—Benzole as 163,680 B.T.U.; petrol as 157,142 B.T.U. From this it will seem that less storage capacity will be required for benzole than petrol for any

given expenditure of power. From practical working it would appear that benzole does work satisfactorily, and that, by a suitable adaptation of carburettor, benzole, or a mixture of benzole and petrol, might be generally used. Importance must, in the view of Mr. Bower, be attached to the fact of benzole being produced in this country, thus rendering the motor industry less dependent on supplies of petrol from foreign sources, in the event of any emergency arising.

#### Heavy Motor-Car Order.

AN amending regulation to the Heavy Motor Order, 1904, was issued by the Local Government Board on Monday, by which a new Order is substituted for article XIV. of the earlier regulations.

This relates to the use and the restriction of the use of heavy motor-cars on bridges. Verbal alterations are made in some of the subsections which vary the phraseology without materially affecting the effect of the regulation. The main change is in the first clause, in which the definition of the heavy motor-car as one where "the registered axle weight of any axle of which exceeds three tons" is amplified to read "or the registered axle weights of the several axles of which exceed in the aggregate five tons, or any greater weight specified in the prescribed notice." The remainder of the clause is brought into harmony with this new rendering of the definition, and the trailer is now introduced, so that the person liable for the repair of the bridge may prohibit "a heavy motor-car drawing a trailer, if the registered axle weights of the several axles on the motor-car and the axle weights of the several axles of the trailer exceed in the aggregate five tons or any greater weight which is specified in the prescribed notice."

#### Essays on Motor Legislation.

THE Motor Union, upon the suggestion of Sir John MacDonald, has decided to award two prizes of five guineas and two guineas for the best essays on the subject of "Motor Legislation: Preparation for the forthcoming Parliamentary Struggle." The judges upon whose recommendation the awards will be made are:—Lord Montagu of Beaulieu, Sir John MacDonald, Sir Henry Norman, M.P., and Mr. C. H. Dodd. The Motor Union hope, as a result of this competition, to obtain some valuable suggestions which may assist the Union to induce Parliament to adopt practical motor legislation which will be satisfactory both to the motoring and the non-motoring public. The following are the conditions of the competition:—No essay must exceed more than 1,500 words in length. All attempts must be typewritten on one side of the paper only. The prize competitions shall become the property of the Union, and the Union reserves the right to publish any essay or part of any essay sent in. The decision of the Committee of the Motor Union, acting on the recommendation of the judges, will be final. All essays must be sent in by March 4th, 1907, addressed to the Secretary, Motor Union, 1, Albemarle Street, Piccadilly, London, W., marking the envelope in the left hand corner with the word "Essay."

#### In Search of the Beautiful.

THE contention of some æsthetic persons that the popularity of motoring, with its accompanying passion for speed, would destroy a taste for natural scenery and render men oblivious to the delights of the landscape, must be accredited to the nescience of the speakers on that particular point. Motorists do not despise the rural charms of this or any other country, while many of those artistic people who previously drank in their fill of beauty in homœopathic doses are now able to see miles of landscape that were previously beyond their reach. Professor Herkomer is both an artist and a motorist. No man combines such a devotion to both as this man of international fame and cosmopolitan sympathies. And he loves his motor because it enables him to see and to realise more of the beauty of the country. As he told the students of the Royal Academy a few

evenings ago, the loveableness of England is a quality that must outlive all passing fashions in art; and just as the painter says there is no need for English artists to go to foreign lands in search of subjects, so we would tell English motorists that there is much that is beautiful in our own land as yet unexplored. At every hand the roads of England could boast of surprise, of something lovely, said Professor Herkomer, and if motorists would sometimes leave the beaten track and journey into the bye-ways, they might become explorers in search of delights that would never pall.

#### Loss to Artists.

THIS artistic recognition of the automobile is all the more appreciable when it is remembered that the coming of the car has proved a factor in the slump that has been experienced by artists with regard to the sale of their canvases. In all the chief countries of the world a decided slackening in the demand for pictures by private buyers has been experienced, and even the booksellers have been calling out about the lessened amount of reading that has been done since people spent more time in indulging in open-air pleasures and delights. It is possibly true that motoring has had a considerable effect upon the tastes and inclinations as well as upon the social habits of the people—but all these things will right themselves in time.

#### Manchester and Newcastle.

THIS week it has been the turn of two great northern centres to have their automobile exhibitions attracting a fair number of local enthusiasts and giving opportunity for local public men to lend the weight of their influence to the automobile movement. At Newcastle, the Mayor, Councillor Oubridge, declared the display open, and expressed his view that it was appropriate for such an exhibition to take place in a town so closely identified with the engineering industry as Newcastle-on-Tyne. Mr. W. Philipson also spoke, dwelling upon the good work of the carriage-builder—now, we would add, that he has fully awakened to the necessity of catering for, instead of ignoring, the new industry. The person who regards the car from the "body" point of view, is frequently regarded as an unpractical motorist; but there is something to be said on his behalf. His training has been along those lines for generations, and he knows that faults of carriage construction are destructive of comfort.

THE New Engine Company, of the Acton Hill Works, Acton, W., send us particulars of some experiments they recently carried out to demonstrate the freedom from vibration of their cars fitted with four-cylinder horizontal engines beneath the front seats. They first ran the engine at from 1,000 to 1,200 revolutions per minute, and then placed a glass full of water on the front seats, having first removed the cushions. The seats, being directly over the engine, take the place of the usual bonnet in vehicles having vertical engines. Under these conditions not a single drop of water was spilt; there was the slightest possible shimmer on the surface of the water and it was quite possible to take an excellent photograph. They then placed the glass on the dash, which in their case is broad and flat topped, and here also no water was spilt and no vibration was noticeable. Next they throttled the engine down to about 150 to 200 revolutions, and again there was absolutely no water spilt, the company regarding this test as a more severe one than that with the engine running at a high speed. To carry the tests to a further point, they afterwards put a glass, full of water to within one inch from the top, on the flat top of the dash and drove the car from a standstill from the works at Acton to the top of Hanger Hill, a matter of 1½ miles, turned the car round and brought it back to the factory with the glass standing all the time untouched on the dash. Not more than a tablespoonful of water was spilt in this operation, and the car was driven in the usual manner, at speeds up to thirty miles per hour.

## THE LATE M. LEON SERPOLLET.

It is with great regret that we have to announce the death of M. Leon Serpollet, which took place in Paris on Monday last, at the early age of forty-eight years. Of humble birth, he gradually forced his way to the front until he became probably the leading authority in the world on the subject of steam automobiles. It was about the year 1887 that he first devoted his attention to the question, his initial production being the three-wheel machine of which we give an illustration on page 1116. In this the boiler was placed at the back of the two hind driving-wheels, the front wheel being the steerer in the usual way. The machine had no movable pedals, but in their place two fixed foot-rests were provided. This little vehicle was found of great utility for carrying a single passenger at a considerable speed, as, for example, in sending messages or delivering small packages. It could attain a pace of twenty miles an hour, its principal feature being the flash

part in most of the early races and contests in France, and his marvellous performances at Nice in the spring of 1901 and 1902—more especially the latter, for it marked the appearance of the Easter Egg—will still be remembered. The deceased was also a regular visitor to England, and rarely, if ever, missed the annual exhibitions at the Agricultural Hall. We can well remember, in the old days of the Arena, how anxious he was to give a demonstration of the speed of his vehicle, and the difficulty we had in preventing him risking disaster, owing to the fact that, although the track was about 200 ft. long, it had a sharp fall to the south, which rendered fast travelling dangerous. Motorists generally, and not merely those interested in steam, will, we feel sure, join with us in an expression of sincere regret that he should be called away just at the time when he was achieving the success for which he had so long striven.

A contributor writes:—"When I last saw the lamented M. Leon Serpollet, outside the Hotel de Luxembourg, at Nice,

*From a photo]*

The late M. Leon Serpollet at the helm of one of the early Serpollet Steam Cars.

*[Taken early in 1896.]*

generator, which he developed to a high degree of perfection. Continuing his experiments, M. Serpollet, later, constructed several superheated-steam carriages, which proved remarkably successful, with the result that works were established for their manufacture on a commercial scale. Coincident with the building of steam motor-cars, he paid considerable attention to the construction of steam tramcars and rail motors, large numbers of which were turned out. Year after year he was a constant exhibitor at the Paris Salon, and when the announcement was made about a year ago of the formation of the Darracq-Serpollet Company to build steam omnibuses, the many friends of the deceased all congratulated him on having at last overcome the great difficulties he had had to contend with. M. Serpollet, always anxious to keep steam to the front, took

about a month ago, seated in his car with his wife and two children, I little thought that it would be the last time I should look upon my friend alive. He was in much better health, he stated, than he had been for some time past, and was looking forward to spending a holiday at his villa on the Riviera. As one who has known the deceased for something like twelve years, his sudden demise has come with a severe shock, and it seems there are others who could have been better spared than our friend, who in the meridian of his life has been suddenly called away. His was a voice that was sweet. His was a mind that was clear. His was a hand that was cunning and clever, and his name and his works will live as being one of the pioneers of the greatest movement in the modern history of the world. R.I.P."

## THE JOHNSON EPICYCLIC CHANGE SPEED GEAR.

**A**LTHOUGH the sliding type or *train-bullieur* form of gear-box is still employed on the majority of cars, an increasing interest is apparently being taken in the epicyclic or planetary type of change-speed gear, especially as this is now being adapted to give three forward speeds in addition to the reverse, as compared with only the two ratios which were available formerly. Several new designs have lately made their appearance, including the Johnston-Buddicom and that used on the New Eagle cars. The latest, however, to come under our notice is that which has been devised by Mr. Heber Johnson, of Princess Street, Manchester, and of which a description follows.

The advantages of the planetary type of gear are well known, the gear wheels giving the various ratios being always in mesh and each speed is picked up directly by means of brake straps.

The new Johnson arrangement has been designed to meet

Figs. 1 and 2.—Views of Johnson Epicyclic Gear.

the growing inquiry for a three speed and reverse epicyclic gear of few and simple elemental parts, with a view to greater efficiency and less cost of production, and so constructed that it is readily accessible, and can be instantly dissembled in the remote contingency of anything going wrong. The gear produces by compound epicyclic motion, together with a friction clutch, three forward changes of speed of such ratios as have been found in practice to be most useful, and a reverse motion, using only one internal toothed ring and six essential pinions.

Referring to the general view, Fig. 1, B is the driven shaft for direct connection to the cardan shaft, the driving shaft for direct connection to the crank shaft of the engine being at the other end of the gear. The gear is held in the underframe of chassis by the cross members as shown at U, the fittings shown being the ones proportioned to fit a standard "Gracile" chassis. The shafts run on large ball bearings held in dust-proof casings. An automatically oil-fed metal-to-metal clutch H, by means of spring arms P, gradually locks the whole mechanism together to produce the high-speed direct drive; there being no end thrust of

the clutch either in or out of engagement, and a lock nut T is provided to allow adjustment for wear. The middle or second speed is obtained by gradually tightening a brake strap on the drum C, this giving a reduction of five to three. To obtain the low or first speed, a brake on the drum D is applied, the gear reduction in this case being four to one. The reverse motion is obtained by braking the drum F.

Fig. 2 gives a view of the internal mechanism, the drum C being removed from the sleeve C for the sake of clearness. I is the cone, and H the internal cone of the high-speed clutch. The drum D is shown detached; it forms with H an oil-tight casing for the whole of the gear. The internal toothed ring E is fixed in the drum casing D and forms the outer braking element of the primary epicyclic motion, of which the pinions J are the planetary and driven element; they in turn gear with a primary driving sun-wheel solid with the driving shaft A; this primary motion produces the first or slow speed. Small interposed pinions K gear with the second half of the primary planets J and with a further central sun-wheel solid with the sleeve C, which constitutes the braking element to produce the second or intermediary speed. Small extension pinions L of the primary planets gear with a further central sun-wheel G, shown together with its drum removed from gear; these, working in conjunction with the primary planets and their sun-wheel, produce the reverse motion. The internal toothed ring only transmits power when the low gear is in use. The pins carrying the planets are bolted in the cage of the carrier formed by the parts N and I, which in turn is bolted to the shaft B; this, therefore, revolves at the various ratios of speed, or with a reverse movement, according to which drum is being held, or at the same rate as the engine when the high speed clutch is engaged, the whole mechanism then running solid and forming so much extra fly-wheel.

All wheels, bearings, sleeves, and clutch run in an oil bath, and are automatically oiled. The gear, which Mr. Johnson claims is more silent in action than the usual sliding pinion type, measures only 9 by 12 in. The gear mechanism as a whole can be taken clear out of the car without disturbing the brakes or operating connections, by simply undoing a spring clip, the driving and driven shafts being connected fore and aft by special universal joints. It can also be dissembled in or out of the car by removing the four set screws holding the internal cone H, which forms an inspection cover to the whole internal mechanism, without the use of further tools.

In addition to being applied to new machines the gear, which has been subjected to long trials, can be fitted to any existing direct drive gear-driven car, or to a chain-driven vehicle fitted with separate differential shaft, adapting the usual side levers and pedals.

MESSRS. MERRYWEATHER AND SONS, of Greenwich, have recently supplied a special combination motor fire apparatus to the Fire Department of Rosario, Argentine Republic. It comprises a tender driven by a powerful four-cylinder petrol motor placed under a bonnet in front; a treble-barrel "Hatfield" pump, arranged to be driven by the motor through simple gear and capable of delivering 450 gallons per minute; a chemical cylinder of a capacity of 90 gallons, arranged to deliver through a hydraulic reel carrying 180 feet of specially prepared rubber hose, and a fire escape of the firm's sliding carriage pattern to reach a height of 66 feet.

A REPRESENTATION of Mr. Charles Jarrott on the racing car driven by him in the Gordon Bennett Race in Ireland in 1903 has lately been presented to him by Mr. Edwards, of Glasshouse Street, London, as a souvenir of the event. As an elaborate piece of carving in meerschaum it is probably unique. The treatment of the meerschaum has been with the object of allowing the cap, arms, tyres, and hubs to colour, leaving the face, racing body, bonnet, and the rest of the road wheels perfectly white. The cigar-holder in question is 7 in. long, and the figure stands 1½ in. high off the holder, the length of the car being about 2½ in.

## CONTINENTAL NOTES.

### A French Reliability Trial.

The Autocycle Club de France has issued the rules of the Reliability Trial which is to be held from the 18th to the 21st May next. The event, which will consist of a run from Paris to Ostend and back, will comprise the following categories:—(1) motor-bicycles of a maximum cylinder capacity of 1.3rd litre; (2) ditto maximum 1.4th litre; (3) tri-cars up to 1.2 litre capacity; (4) voituresses up to 6-h.p.; and (5) ditto up to 8-h.p. On the first day the journey will be to Boulogne, on the second to Ostend, on the third to Rouen, and on the fourth Paris will again be reached. An average speed of nineteen miles per hour will be required, and marks will be deducted at the rate of one for each half-minute that the competitor is behind the time allowed.

### The Grand Prix Race.

No decision was taken at the meeting of the Sporting

of early designers, the work of the many British engineers in the early part of the last century naturally coming in for a large amount of attention. Later he deals with the work of Daimler, Benz, Bollée, Serpollet, and many other pioneers of the modern movement, while the latter part of the book is a record of the rapid development during the past ten years not only in the construction of motor-cars but of their adoption and use. The principal races of the past decade are all alluded to, the interest being increased by the liberal use of illustrations.

### The Cannes Automobile Meeting.

It has been decided to hold a number of motor events at Cannes from March 6th to 16th. On the first day there will be a series of speed trials on the level and a hill-climbing competition; on the 9th a petrol consumption trial; on the 11th a brake test; on the 12th an excursion to the Col de Braus; on the 14th a flower fete; and on the 16th an automobile paper chase. The organisation of the meeting is in the hands of the Automobile Club de Cannes.

Sight Seeing by Motor-Car.—One of the two 24-h.p. De Dion Char-a-bancs employed for sight-seeing purposes in Paris by Messrs. Thomas Cook and Sons.

Committee of the A.C.F. last week with regard to the course on which the races for the Grand Prix and the Coupe de la Commission Sportive shall be held, the matter having been postponed to permit of a further inspection of the proposed Seine-Inferieure circuit, which was duly made on Sunday last. Dieppe is the principal town on the line of route, and the authorities of the district have offered a sum of £4,000 towards the organisation of the race, and guaranteed to put the roads in good condition.

### The History of the Automobile.

Under the title "Histoire de l'Automobile," Messrs. Dunod and Pinat, of Paris, have just published a work which will be of service to all interested in tracing out the development of the modern motor-car. It is from the pen of M. Pierre Souvestre, who has been at evident pains to make the book, which extends to about 800 pages, as complete as possible. Beginning as far back as the 17th century, the author briefly describes the efforts

### Miscellaneous Items.

One of the Renault motor-cabs in Paris is now being driven by a woman.—A public motor-car service was inaugurated last week between Toulon and Draguignan, France.—A monument to the late M. Levassor, the originator of the so-called Panhard type of motor-car, will be erected in Paris on June 15th next.—Mr. Van Marcke, on a Hotchkiss six-cylinder car, left Paris last week on a 7,000 kilometres tour of France.—Finding that the absence of a number on his car, which he was using in Paris, gave rise to misunderstanding and confused the authorities, King Edward, during his visit to Paris last week, ordered one to be obtained from the Prefecture of Police, and during the latter part of the visit the royal vehicle bore the number 447E5.—A motor-car exhibition is to be held in Copenhagen in September next.—The death took place last week of Madame Bob Walter, a well-known personality in the French motoring world. She was the proprietor of a garage in the Avenue de la Grande Armée, Paris, where a speciality was made of providing motor-cars for elopements.

## ACROSS INDIA BY MOTOR-CAR.

BY THEO MASUI.

(Concluded from page 1090.)

THE landscape is anything but pretty as soon as one leaves the Ghauts. At this season it is shockingly dry, giving one the impression of a desert, though the land is everywhere cultivated or showing the remains of cultivation, principally of cotton and rice. As to trees, there are acacias, tamarinds, wild date palms, while the plants include euphorbias, cacti and a dry fine grass on which the cattle browse. Even the outskirts of the villages are barren, and it is only when nearing the towns that the country becomes more pleasant. The localities themselves are often very picturesque, with their temples, their minarets, the numerous pavilions, with the regular dome supported by thin columns; when all these are built along the banks of the river they make a very pretty picture.

Some towns traversed, such as Nasik and its sacred river, with the temples studded along its banks; Mak-ee and its fine temple, Jain; Gwalior and its celebrated fort, are all mentioned in the various guide books. As for us, what pleased us most were those isolated villages, those ignored corners from which still emanates the impression of primitive India, living on in the same style as they did many centuries before, passive and immersed in its ancient creeds. With this exception, instead

serve as kitchen and lodgings for the native servants. There are bungalows of three or four rooms; some "furnished bungalows" can boast of table linen and rudimentary crockery, but bedding and towels are never to be found. It is, therefore, necessary to bring the bedding along; this consists of a thick quilt—used as a mattress—a pillow, sheets and blankets *ad hoc*. All these are closely packed in a hold-all, and this bedding can be bought complete at Bombay, or in nearly every important town. It is also advisable to carry a "tiffin basket" filled *ad libitum* with a little crockery and a miniature kitchen set. Everywhere one can find food, simple of course, but, as a precaution, it is as well to get a small assortment of preserves, and one should not forget tea, sugar, biscuits, condiments and a couple of tins of meat. With a little ingenuity and the assistance of a good native servant one can get on well anywhere. It is to be noted that the keeper of the bungalow is always obliging and of great help. At some places one can procure bread and soda water; at others one must be satisfied with tea, biscuits, or native bread, a rather indigestible article. One has the right to occupy the bungalow for twenty-four hours; after that one has to leave the place to another traveller, if he turns up; however, if one strays from the track usually frequented by tourists, this is rarely the case; besides, the bungalows are very numerous, there being about thirty between Bombay and Agra. It is also permissible to lodge

Across India by Motor Car.—Preparing to cross the Tapi River.

or again living through my former travels in Central Africa, instead of finding again, as I imagined, the luxurious tropical splendour, the country traversed reminded me rather of Arabia and Nubia, at least at that time of the year; for as soon as the monsoon appears everything will be inundated by torrents of rain, and, as if by magic, the country is refreshed and green again, and the dust of the road turned into quagmire.

On the third day of our journey we were actually cold. As soon as the Ghauts are passed the high temperature of Bombay is succeeded by a cool one, even cold in the evening, necessitating the use of cloaks and rugs. In the car we were frozen. During the middle of the day the sun stings a little, but as soon as it disappears winter sets in cold and dry, but all the more felt as it supervenes without transition. All along the road, either by the care of the English or the native Government, inspection bungalows and Dak bungalows have been erected, intended for the accommodation of officials or travellers. They consist of pretty pavilions of stone, having only a ground floor, with verandahs and terraces. These buildings are of various sizes, more or less only equipped with the most essential furniture, but perfectly arranged. The ordinary Dak bungalow has two rooms, containing a bedstead, or rather girthed stretcher, a table, chairs and armchair; each room communicates with a lavatory, containing a zinc tub. One or more small structures near by

in the waiting-rooms of the railway stations; and, considering the hospitality which is everywhere practised here, there need never be any fear of being obliged to spend the night in the open. Amongst the most beautiful bungalows of the road mention should be made of those established by Scindia, and the "Guest House" which he has erected at Gwalior may be termed sumptuous; it is in reality a sort of hotel at popular prices, but to which travellers are admitted with certain restrictions. We did not lodge, but only lunched there.

In drawing up the programme of our tour I had fixed seven halting places—Nasik (120 miles), Dhulia (100 miles), Khal Ghat (110 miles), Maksee (96 miles), Goona (123 miles), Gwalior (130 miles), Agra (73 miles). We adhered to these distances up to Maksee, and practically they were sufficiently long, considering the unforeseen occurrences and difficulties encountered. After Maksee we could proceed more freely, and my car went so gamely that I was able to pass Goona and go on to lodge at Sipri, finally arriving a day earlier than calculated in Agra, which we entered on December 27th, having accomplished an absolute non-stop run, at the end of which the car, as well as the passengers, were in perfect condition, and ready to take to the road again for Calcutta immediately after the Durbar.

THERE are now eighteen entries for the Tourist Trophy Race, and three for the Heavy Touring Car Race.

## SOME CURRENT TOPICS.

### The Argyll Cars.

One day last week we spent an afternoon with Mr. E. H. Watson, the managing director of Argylls London, Ltd., in putting one of the latest Argyll 14-16-h.p. four-cylinder cars through its paces, and were very favourably impressed not only with its silent and smooth-running qualities, but also with its hill-climbing capabilities. Leaving the Argyll depot in Newman Street, W., Mr. Watson was into his top gear within a very few yards, and the change-speed lever was not again used until Hampstead was reached, where a block in the traffic brought us to a stop right on the steep part of the rise. Our trial run included a "promenade" through busy thoroughfares as well as on the open road, affording ample scope for observing the great flexibility of the engine and the general efficiency of the multiple disc clutch and transmission mechanism, for, with the exception of the occasion mentioned, the whole outward journey was done on the high gear. After having successfully climbed the well-known gradient of Netherhall Gardens, N.W., we ourselves took charge of the steering-wheel, and it speaks much for

maximum pressure of the inflammable mixture may be reduced, the average pressure is increased, which, combined with the diminished loss of heat through the cylinder walls, gives a more regular expansion of the gases and a lower temperature to the exhaust. Our reference to the subject is occasioned by the fact that during the past week we have had submitted to us, by Mr. George Gibson, of New Street, Westminster, S.W., an ingenious and compact arrangement whereby the engine itself automatically injects into the combustion chamber, immediately after the charge has been fired, a small quantity of water, which is instantly flashed into steam. The apparatus, which is about the size of a large sparking plug, comprises a small pump, the ram of which is actuated by the pressure of the compressed gas. Mr. Gibson claims that by his arrangement not only is there no disturbance to the quality of the mixture, but that an increase of no less than 15 per cent. in the power developed by the motor is obtained. Unfortunately it is not possible for us to give full details of Mr. Gibson's device at the present time, but we are looking forward with interest to the development of the idea. There can be no question that the subject is an interesting one, and if any readers of the *M.C.J.* have carried out experiments in a similar direction we shall be glad to hear from them.

### Accessibility and Cleanliness.

In connection with Mr. F. L. Martineau's recent paper to the Institution of Electrical Engineers on the above subject,

Chassis of Empress 14-20-h.p. Car. (See page 1128).

the easy control adopted that we were at once quite at home, and safely drove back to the garage without any previous experience of the particular vehicle. The speed of the engine is controlled by means of two levers—one connected with the throttle, and the other with the ignition—working on a quadrant located above, but not rotating with, the steering wheel, and as the bulk of the driving is done on the top speed—the third in the case of the Argyll cars—the work exacted of the driver is reduced to a minimum. We were particularly struck with the positive and noiseless operation of the Govan "gate" change-speed gear. It was with some trepidation that we essayed to manoeuvre this, fearing to lose caste in the eyes of our experienced companion by making a noisy change. Our fears were, however, entirely unfounded, for the gears slipped in without the slightest hesitation or sound. Altogether the run has given us a very high opinion of the 14-16-h.p. Argyll, and we are not surprised to hear that its popularity in motoring circles is rapidly extending.

### Water Injection to Increase Power in Petrol Engines.

During the past few years many experiments have been made in the direction of increasing the efficiency of petrol motors by the introduction of water into the explosion chambers. Various opinions have been expressed as to the effect of the introduction of water, the more general one being that while the

Mr. R. W. A. Brewer has since made a written contribution to the discussion, in which he elaborates his view that "too much accessibility is a dangerous thing." He thinks it extremely inadvisable to sacrifice any simplicity or rigidity in construction in order to obtain a greater accessibility to those parts which seldom—say once a year at the most—require examination. His argument is that it is advisable that every motor-car which does a good year's work should at the end of that time be completely examined by a competent person and the necessary repairs then done. If this were the case there would be no need to have greater accessibility to such things as pistons and crank shafts, which, if made of suitable material and properly assembled in the first place, should show no appreciable signs of wear at the end of one year. Cam shafts also have been made for many years perfectly accessible by removal of a side cover, but these parts, if properly made and hardened, seldom require attention, and if they do so, any alteration or trimming up of the cams can only be done by grinding with emery, and should be left to a proper repairer.

A CATALOGUE of their motor-car accessories and specialties comes from Messrs. G. Robertson and Son, Snawdon Works, Sneddon Street, Paisley. The illustrations include radiators of various designs, bonnets, dashboards, body panels, wings, mudguards, &c.

## BRITISH ELECTRICAL IGNITION APPARATUS.

IT is not so very long ago that the bulk of the ignition fittings on motor-cars—even those of British construction—were of foreign manufacture, they being deemed superior to those produced in this country. While this may have been true at the time, this objection to British made articles no longer holds good, as during the past few years quite a number of English firms have centred their attention on the production of accumulators, coils, and other ignition specialities, the result being that it is no longer necessary to go to the Continent for supplies of this kind. Among the concerns alluded to is the Prested Miners' Lamp Company, Ltd., of Holloway, N., who, as an outcome of thus specialising, have met with considerable success in this department of the motor accessory business. Some time ago Messrs. Prested submitted to us a sample set of their accumulators, sparking plug, and induction coil, and, although we have so far not been able to give the whole of these a practical test, the results we have obtained with the first two permit us to speak very highly of the Prested productions.

To deal first with the accumulators, these are the product of the firm's experiences with electric miners' lamps, in which high efficiency and capacity combined with lightness and indestructibility are great desiderata. The plates, which, as a result of some recent improvements, are capable of withstanding a large amount of careless treatment, are made from a mixture of lead, antimony, and an additional metal to give greater strength, and are afterwards filled with a special paste. They are fitted in the cells in

The Prested Coil with Cut-Out Device.

such a way that they rest on a celluloid support, while a useful feature, and one which considerably reduces the possibility of internal short circuits, is the provision between each plate of a sheet of corrugated and perforated celluloid  $\frac{1}{4}$  in. thick. Special attention is paid to the battery terminals, which are not only differently coloured to distinguish the positives from the negatives, but are securely attached to the bridge connecting the plates; insulating material is also introduced between the connection and the terminal end, by means of which any creeping of acid or oxidation of the positive terminals is prevented. The accumulators are made in a wide range of sizes extending from 12 to 100 nominal ampere-hour capacity. The number of plates in the cells varies, of course, with the capacity, the 60 amp.-hour (nominal) size containing seven, each 4 in. wide. On a continuous discharge of one ampere this accumulator will give 36 amp.-hours, sufficient to run a single-cylinder engine car about 1,800 miles on one charge. The battery we have had in use is that known as the C5 size, the nominal capacity being 40 amp.-hours and on continuous charge 24 amp.-hours. The makers inform us that it will run a single-cylinder vehicle about 1,200 miles, but although we have not been able to test this, owing to the fact that, for one reason or another, the particular car on which it has been used has not been out very much during the winter months, we have found it to hold its charge extremely well and that it shows no signs whatever of sulphating. We may add that the cells, on which the charging rate is clearly marked, are very compact for their capacity, the C5 above referred to measuring  $4\frac{1}{2}$  in. by  $3\frac{1}{2}$  in. by  $6\frac{1}{4}$  in.

Passing now to the Prested induction coils, these are made in sizes suitable for engines from one to four cylinders and in a variety of patterns, special care being taken in the manufacture to secure a maximum of efficiency for the amount of current

consumed. The different layers of the silk-covered high conductivity wire in the coil are insulated from each other by a bed of special fabric which is claimed to render internal faults practically impossible. When the desired number of layers are in place, the coil is immersed in a bath of insulating composition, in which it is allowed to remain for a considerable time. The tremblers, which are prepared by special machinery, when carefully regulated will, it is claimed, give from 20,000 to 24,000 vibrations per minute, the current consumption in the case of a single-cylinder engine being about .7 amp.-hour. Amongst the latest productions is a single trembler coil for use on multi-cylinder engines on which a high tension distributor is employed, and a four-cylinder coil made on the interchangeable unit system. In the latter the four coils are quite distinct, and any one of them can be removed for repair or replacement, should the same be necessary. Furthermore, the trembler on the new coil is provided with a special feature in the shape of a "cut-out" device. As shown in the accompanying illustration, there is a small trigger or cam, which, by a slight movement, presses on the armature and separates the platinum contacts, thus cutting off the current. Provision is thus made for testing each cylinder in turn more conveniently than by the usual method of holding three tremblers down by the fingers and leaving one in action. The trigger holds the tremblers down permanently, so that the hands are free to make any adjustments required to the engine. All the different coils are supplied in polished teak cases with plated fittings and have a neat as well as a highly-finished appearance.

To complete the outfit there is the Prested sparking plug, which is made for the Prested Company by Messrs. J. A. Prestwich and Co. In this the insulating material is of special porcelain, an air-tight joint being obtained without the use of any cement or packing. The plug, all the parts of which are produced on the interchangeable system, is substantially made and is so designed that there is no danger of shorting. Having at various times had considerable trouble with porcelain plugs, we were rather sceptical about fitting a new one, but, so far as we have gone, the Prested has given very satisfactory results, the plug working regularly even on one occasion when the engine was so considerably over-lubricated as to emit clouds of smoke. In addition to the specialities mentioned above the Prested Company makes all kinds of "motoroids," such as charging boards, including a celluloid repair outfit with the registered title "Celludine," a novel accumulator test lamp, high and low tension cable of the best insulation, hydrometers, voltmeters, &c., and an excellent indication of the popularity of their productions is the continued extensions which it has been found necessary to make to the factory.

MESSRS. CASTLE AND SONS, of the Carriage and Motor Works, Worksop, have sent us a photo of a combined char-a-banc and luggage car they recently completed for the Duke of Portland. The feature of the body, which is mounted on a Thornycroft petrol bus chassis, is that the rows of char-a-banc seats are so made that they can be quickly removed and refixed in position, enabling the vehicle to be either used to convey loaders in the shooting season or for the transport of luggage. Since its completion the car has, we understand, been given an extensive trial in Scotland.

MESSRS. H. E. HALL AND CO., of Tonbridge, are pioneers in the automobile business, and their commodious works in Kent are well adapted for repair work as well as for motor body building. Among their agencies are those of the Isotta-Fraschini and Germain as well as the Talbot, for which they are the sole Kentish agents. They have also the control of Singer cars for London and the district. Besides representing these high-grade cars, Messrs. Hall and Co. are district agents for many leading makers of accessories, motor clothing, &c., and in their new catalogue for 1907 are able to enumerate a long list of distinguished patrons. Their London offices and showrooms are at 15, Riding House Street, Langham Place, W., and the wide experience of Messrs. Hall and Co. is at the disposal of present and prospective motorists.

THE Bishop of Salisbury is now the owner of a motor-car.

THE Irish Reliability Trials will be held in May, viz., from the 22nd to the 25th inclusive.

THE draft order of the Home Secretary with regard to metropolitan hackney vehicles implicitly abolishes the four mile radius as regards motor-cabs.

AT the dinner of the General Electric Company, Ltd., in London on Saturday, Mr. Robert Hammond said that the desire to buy motor-cars was the reason people did not spend so much on electrical supplies.

MESSRS. J. PARSONS AND Co. have a motor garage at Tyn-y-coed Place, Cardiff, where they have lately extended their facilities for the repair of all classes of automobiles. They also stock accessories and petrol.

THE Sirdar Rubber Company, Ltd., have removed their Dublin depot from Moss Street to 6, Harcourt Street, where a stock of pneumatic tyres will always be ready for immediate delivery and fitting. They have also opened a depot at 249, Deansgate, Manchester.

AT a meeting of the British Aluminium Company, Ltd., the chairman, Mr. J. D. Bonner, referred to the demand for aluminium being largely in excess of the supply; but, as all the producers are enormously increasing the amount of power at their disposal, the existing famine will soon be succeeded by a plethora of the metal.

THE Motor Academy and Repair Works are providing at Boundary Road, Notting Hill, London, W., a finishing school for drivers. On certain mornings of the week one of their 20-h.p. four-cylinder cars leaves the academy for a long day's run of about 100 miles with four students and the instructor, each student taking it in turn to drive.

THE suggestion of Messrs. Lawton and Co. to put 100 motor-cabs into service at Chester has been met with a vigorous agitation on the part of the local cabmen, who have obtained between 5,000 and 6,000 signatures to a petition to the Town Council in opposition. Sir Horatius Lloyd, the Recorder, has given the weight of his influence to the anti-motor campaign.

SIR CHARLES SCOTTER, at the half-yearly meeting of the London and South Western Railway Company, attributed the falling off in the first and second class passenger returns to motor-cars, and in the metropolis to the competition of tramways and motor-buses. He recognised that motor-cars had come to stay, and what the company had to do was to see whether they could not compete with them by cultivating in the best manner possible their seaside and long distance traffic, which after all was the most profitable for the company.

VERY conveniently situated in the central part of the South Staffordshire district, on the main roads leading from Birmingham, Smethwick, Oldbury, and West Bromwich to Dudley and that part of the country, is the garage of Messrs. W. T. Skelding and Co., Ltd., of the Burnt Tree Works, Tipton, near Dudley Station. The garage is not far from Dudley Castle, and has accommodation for fifty cars, while arrangements have been made with the Station Hotel, of Dudley, for the accommodation of Messrs. Skelding and Co.'s clients spending the night in the district.

THE new catalogue of Lacre motor lamps, which we have received from the well-known motor-car company of that name in Poland Street, W., is an excellent compilation, drawing attention to some specialities of sound construction and good design. All the parts are interchangeable, and may be purchased separately, while the adoption of a code prevents delay in the despatch of goods ordered by telegraph. The Lacre dioptric lens headlight with extended front is a leading production of the concern, giving a brilliant light for seven hours on one charge of carbide. For light cars a smaller size lamp is made, fitted with a vertical generator and having provision for five hours' illumination on one charge. In addition to the headlights, side lamps and regulation tail lamps are illustrated, as well as the Lacre lamp-bracket and independent generators.

THE motor-cars—and there were several—in the procession of Women Suffragettes in London on Saturday were driven by chauffeurs, not chauffeuses.

THE Standard Motor Company, Ltd., have now removed to their new works in Foleshill Road, Coventry. The premises are eminently suitable for the construction of cars, and will give the firm facilities for a much greater output than hitherto.

MESSRS. TESTE AND LASSEN have been appointed sole agents for the Weigel cars for the county of Yorkshire. One of the members of this firm is the well-known French driver of racing cars. The Staffordshire agency for the same vehicles has been secured by Mr. H. K. Hales, of Burslem, Stafford.

IN the New Road, Wandsworth Road, S.W., the Projectile Company (1902), Ltd., has established a motor-car repair department and will make a speciality of carrying out alterations to chassis and motor-car bodies. They have also an excellent garage, and are keeping a large stock of accessories, lamps, tyres, &c. Facilities have also been provided for the repair of tyres as well as of cars.

"The Belle of Mayfair," (Miss Billie Burke) in a Mayfair Car.

FOR consistent running a well-known Yorkshire motorist seems to have established a record with his 26-30-h.p. Argyll. He drove from London to Leeds on a Saturday, with an excellent mileage average, and on returning to town the following day he covered the 180 miles in a time varying only two minutes from that recorded on the outward journey, the difference being accounted for by the fact that he had to enter London at dusk.

MESSRS. J. C. LYELL AND Co., of Victoria Street, Westminster, S.W., has just introduced a new change, over switch, known as the "Zulu," for use on cars fitted with two systems of ignition. This apparatus is designed to allow of the employment of either the magneto or coil at will for firing a motor fitted with only one plug per cylinder. The switch is arranged so as to send to each plug the secondary current from the magneto or coil, and allow at the same time to cut off the primary of the coil in the case of the magneto, and to put the primary of the latter into short circuit when the coil is being used, the two operations being simultaneous. The switch also provides a complete interrupter for both circuits. The working apparatus is confined in an insulated block, so as to prevent dust and damp from interfering with its correct working, while the complete switch is enclosed in a wooden case, arranged to be fixed to the dashboard or other convenient place.

MR. A. K. MOE, the American Consul in Dublin, purchased a 16-h.p. Reo touring car at the Dublin show.

MESSRS. SHARMAN AND LADBURY have a large motor garage at Melton Mowbray, which was crowded on the occasion of the Hunt Ball held there a few evenings ago.

MESSRS. HUMBER, LTD., have just supplied a car through their local agent, Mr. J. S. Cordingley, of Haslingden, to the Hon. W. Brooks, of Crawshaw Hall, Rawtenstall.

MESSRS. G. POLKEY, LTD., of the Hockley Lamp Works, Birmingham, have recently brought out a new side light, similar

in appearance to their well-known head lamp. The makers guarantee that it is absolutely wind-proof. When filled with paraffin it will burn for eighteen hours. The oil tank is a fixture, and cannot get lost, the reservoir being replenished from the outside. Having a glass chimney the light is very steady and decidedly good—in fact, the lights are sufficiently powerful to drive by in cases of emergency.

A NEW series of motor-cars known as the Rennie are being put on the market by the Rennie Motor Manufacturing Company, of Western Road, Brighton. Three sizes of four-cylinder cars—10-12-h.p., 12-15-h.p., and 25-30-h.p.—are being turned out, as also a 30-h.p. six-cylinder model. We understand that in addition to being moderate in price they com-

prise several special features which have only been adopted after extended trial.

THE President of the Local Government Board is to be asked to receive, at an early date, an influential deputation of motorists with reference to motor legislation in the present session of Parliament.

WHAT was formerly the central fire-station at Eastbourne is now a motor garage in the possession of the Grove Eastbourne Motor Works and Garage, Ltd. Their address is the Arcade, Grove Road, Eastbourne.

WITHIN easy distance of the sea front at Weston-super-Mare, and in a central position in the town, Mr. H. J. Blackmore has established a motor-car garage. It is located in Wadham Street, and has accommodation for nearly a score of vehicles.

CANON ATKINSON, vicar of St. Michael's, Coventry, writing to his parishioners, asks:—"Is it any use keeping Lent? Isn't it a worn-out superstition, no longer needed in a city of cycles and motor-cars, which are the outward symbols of the unrest of the age?"

THE Isle of Man Motor Company is the title of Messrs. Bonser, Bunter and Co.'s branch in Manxland. This Leeds firm has established a garage at 21, Circular Road, Douglas, and another at Baldrine—a little place between Douglas and the delightful village of Laxey.

MESSRS. CHARLES WINN AND Co., of St. Thomas's Works, Birmingham, are making a special feature of the production of motor fittings in steel, brass, gun-metal, bronze, and aluminium. They have also a patent mechanical oil distributor, which can be supplied with from one to six feeds, and makes a neat dash-board fitting of good efficiency.

THE Toope patent automatic safety lamp is a convenient and safe means of heating and lighting, which has been brought out by Messrs. C. Toope and Son, Stepney Square, Stepney, London, E., and is of general interest. The oil reservoir is placed on a higher level than the burner, and the oil is conveyed by means of a feed pipe to an automatic valve chamber where the supply to the wick is governed. As fast as the oil burns it is replenished at an equal rate, securing a steady, light, uniform heat. The device works as accurately as a clock would, and will doubtless prove of value in many garages and similar places where a steady warmth is desirable.

By special arrangement the cars of Messrs. West, Ltd., will now be styled "West-Aster."

A NEW works for the construction of motor-car bodies is about to be started at High Wycombe.

LADY MUIR has placed an order with the New Engine Company for a 30-h.p. N.E.C. limousine-landaulet.

ADDITIONAL motor-house accommodation is to be provided, with an entrance in Piccadilly, for members of the A.C.G.B.I.

PINIONS with the shallow or stub form of tooth for motor-car gears are now being made by the Brooke Tool Manufacturing Company, Ltd., of 17A, Belgrave Road, Birmingham.

MESSRS. MATTHEWS AND BROOKE, of Bradford, have issued a complete catalogue of motoring literature—quite a formidable list of volumes relating to our modern industry.

THE High Holborn Motor Agency, of 158, High Holborn, W.C., have taken over a garage in the neighbourhood of their present premises, where they will have facilities for the repair of cars, &c.

MESSRS. BUCKLER AND WEBB, LTD., of Birmingham, are issuing a guide to the garages of the West of England, which will be of service to motorists on tour in that district of England.

RENE THOMAS, the French motor-cyclist, who met with an accident at the Canning Town track last July, was able to leave the Poplar Hospital on Saturday, after lying there for eight months.

FROM Messrs. Broom and Wade, engineers, High Wycombe, come a descriptive catalogue of the motor-lorries they are now turning out with 20-h.p. horizontal engines adapted to use paraffin as fuel. They are built to carry loads of three and four tons, and are claimed to be very economical as regards cost of fuel per ton-mile.

MESSRS. ALFRED HERBERT, LTD., of Coventry, have issued a catalogue of their milling machines, both of the horizontal and vertical type, which will be of interest to all engaged in the construction of automobiles. In addition to the illustrated descriptions of the machines there are a series of notes and hints on the use of milling machinery generally, as well as examples of work. From this point of view the catalogue has considerable technical, apart from commercial, merit.

DOUGILL'S ENGINEERING, LTD., Leeds, have sent us a photograph of a Frick motor delivery van which has been successfully run for some time by Messrs. J. Tordoff and Sons, Ltd., Bradford. The vehicle, which is fitted with a 9-h.p. engine and the latest type of variable friction transmission gear, is used in the hilly Yorkshire district, and carries up to 10 cwt.

FROM Messrs. Peter Lee and Sons, High Street, Glasgow, come some useful pocket pencils, bearing a reminder of their Mobiline oils and greases for use on motor cars.

MESSRS. C. HOODYDONK, of 6, Leather Lane, Holborn, E.C., have been appointed sole agents for the Instant Test Lamp,

by which motorists will be able to test their accumulators without having to resort to the cumbersome method of lamp and wire.

There are no wires to worry about, and it is made in a convenient size to be carried in the waistcoat pocket. Therefore, it is always at hand ready for use. It is adjustable to any size accumulator and is instantaneously applied without removing the accumulator from the case.

ARRANGEMENTS have been concluded for an examining official to attend at Boulogne on certain days in order that members of the A.C.G.B.I. may obtain their French licences on arrival in France. This will be a great convenience, as up to the present it has always been necessary for members arriving in Boulogne to apply at Arras, some distance away, for licences.

(Letters to the Editor should be addressed to the office,  
27-33, Charing Cross Road, W.C.)

### MOTOR LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. J. S. Critchley's letter in the *M.C.J.* of the 2nd inst., this gentleman does not make it clear to me what point he means by the "one point of friction reduction" which "has been almost forgotten," but he goes on to discuss the use of an oil, thin at ordinary temperatures, as compared with that of a thick one. May I repeat my remark, which was fortunate in meeting with the approval of such an expert as Mr. Veitch Wilson, i.e., "That the varying conditions controlling the selection of a heavy or light grade of motor oil all exist outside the cylinder, because at the high temperatures in the interior of the cylinder all oils approximate very closely in viscosity, even though they vary at ordinary temperatures." Taking the heavy oil and light oil which my firm supply respectively to Messrs. D. Napier and Sons and Messrs. Yarrow and Company, their viscosities at various temperatures are:—

		70° F.		140° F.		200° F.		300° F.
		sec.		sec.		sec.		sec.
Heavy	...	3,100	...	253	...	75	...	40
Light	...	1,270	...	135	...	52	...	35

and although we cannot accurately ascertain the viscosities at such high temperatures as exist in practice, we know that they still more closely approach one another as the temperature rises—so much so, that the difference can be of no importance at the temperatures in question.

But where the difference of viscosity has its effect is rather in the crank chamber, where the temperature is comparatively low. There, of course, the heavy oil may cause an unnecessary consumption of power in the overcoming of its internal friction, and no doubt the benefit of the use of the lighter oil would be felt, always supposing that there was no excessive play in any of the bearings. I make this reservation as, if there be play, a viscous oil forms a convenient cushion between the moving surfaces, and any noticeable knock may be quietened. A further justification of my disregard for viscosity in the lubrication of motor cylinders can be found in heavy gas and oil engine practice. In many large sets of several hundred horse power my firm's "light" oil is used with every satisfaction, and here, as the pressure is so much greater, especially in the horizontal cylinders, one might naturally suppose a greater viscosity would be required. What a large margin of safety we must therefore have in using the same oil on our small powered engines.

Now as to Mr. Critchley's theory of carbonisation, I agree with him that light oils are less liable to deposit carbon than the heavy, it being a condition of comparison, however, that the two oils should be of the same origin, and of the same chemical refinement and chemical purity. But with his reasoning I cannot agree. He speaks of the light oil "running off clean." This is a very convenient way of disposing of the oil, but where does it run to? And as the heavy oil has practically the same viscosity at the temperature involved, why does it not "run off clean" also to the same place, wherever Mr. Critchley may suppose that place to be? I believe that Mr. Critchley should rather consider the question as one of distillation, as it is here that the greatest divergence is found between the two oils. The light oil has a considerably lower boiling point, and if pure, as already stipulated, as soon as it has done its work on and behind the rings it reaches this hot combustion area, and, owing to its higher distillation point, cannot get away so quickly, and its higher boiling fractions have, so to speak, to stay behind and be roasted and oxidised, and so decomposed carbon being deposited; and further, suppose you take the light oil and expose it to such a temperature, say as low as 400 deg. F., that it cannot distil, but has to remain and undergo the same roasting, it oxidizes and decomposes, depositing carbon, just as does the heavy oil. But go one step further, and heat that same light oil for the same period at the same temperature of 400 deg. F. in a sealed glass tube, so excluding oxygen, you will find that the oil is practically unaltered, and certainly there is no sign of carbon being deposited. This is not theory but practice, and these tests are carried out nearly every day in our ordinary laboratory routine, so that if Mr. Critchley had spoken of "flying off clean" instead of "running off clean" I should have agreed with his views.

I am glad to be able to agree with him on one point, and that is, that when once carbon is deposited, the evil grows very rapidly, for the higher boiling fractions of the oil impregnate the porous surface so offered, and the decomposition is more rapid, owing to the greater areas of oil and gas that are brought into contact. This decomposition also, I think, explains the reason why, with a heavier oil, one frequently gets heavier smoke and greater smell. Any distilled oil vapour will not show as smoke, nor will it smell offensively, but the smoke is formed rather by the finely divided carbon which has been liberated by the decomposition, and the smell is due to a lower series of hydrocarbons and oxidized products which are formed in the same manner. There is another factor in the formation of the so-called carbon deposit, and I hope to be able

to write a word or two about this in the near future, when my theories have been further confirmed by practical tests.—Yours truly,  
A. DUCKHAM.

### THE ORGANISATION OF MOTOR-CYCLISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am instructed by my committee to call your attention to a point which is of extreme importance to provincial clubs.

This club, and, I presume, the majority of provincial clubs, includes both motor-car and motor-cycle members. Hitherto it has been possible for a club to affiliate its car members to the Motor Union at 2s. 6d. per member, and the motor-cycle members to the Auto Cycle Club at 2s. per member. The Auto Cycle Club has advised our club that it is unable to renew its agreement with the Motor Union, so that the old 2s. per member scheme has fallen through. Various alternative schemes are now in the air, but none of these are so favourable as the old schemes.

As far as can be made out, the Motor Union, is trying to raise its affiliation fees. We find that on a subscription of £1 ls., and an entrance fee of 5s., we cannot afford a heavy affiliation fee, and that we should like to obtain satisfactory affiliation for our club members at about 2s. 6d. per head. Undoubtedly the ideal would be to pay the Automobile Club 2s. or 2s. 6d. for each car member, and the Auto Cycle Club a similar sum for each motor-cycle member, this affiliation to carry with it the legal defence which the Motor Union provides for its members.

We presume the position of affairs will affect you in a manner similar to that in which it affects us, and we think that a combination of the provincial clubs is necessary to prevent the affiliation fees being made prohibitive to clubs with small subscriptions—that is to say, any-

Madame Decouge, the first Woman Motor-Cab Driver in Paris.

thing under £2 2s. per annum. We should therefore be glad to hear if you propose taking the matter up, or, if not, how you propose dealing with it.

A point which is of some interest, and which must be settled, no matter what affiliation scheme is decided upon, is that of a "joint" member. That is to say, a member who usually rides a motor-cycle but sometimes drives a car, and is compelled to make a claim in respect of an accident, &c., incurred when driving a car. This member may pay an affiliation fee to the motor cycling authority. This authority may refuse to assist him, as he was not at the time a "motor-cyclist," whilst the car authority (the Automobile Club or Motor Union) may refuse to assist him in that he does not pay an affiliation fee to the car authority.

This club has never yet made an appeal for assistance to any of the authorities to which it is affiliated, but we can see that in certain cases difficulties such as the above may arise which we think should be gone thoroughly into, and that as soon as possible.—Yours truly,

E. W. WALFORD.  
Hon. Sec. Coventry Motor Club.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The attention of the Motor Union and the Auto Cycle Club has been directed to a letter which has been circulated by a local motor club, dealing with the question of affiliation. It states that it has hitherto been possible for a club to affiliate its car members to the Motor Union at 2s. 6d. per member. Such is not the case. For more than a year it has not been possible for any club to affiliate with the A.C.G.B.I. and the Motor Union at an affiliation fee of less than 5s. per member.

Over fifty clubs have signed the affiliation agreement with the A.C.G.B.I. and the Motor Union, and have paid without exception an affiliation fee of 5s. per member; whether such members own motor-cars

or motor-cycles. The Motor Union has been seeking to harmonise the scheme for the affiliation of motor-cyclists with its standard scheme, and to arrive at an arrangement which will bring all motor-cyclists into touch with the Auto Cycle Club, and secure to them the benefits and privileges provided by both the Auto Cycle Club and the Motor Union.

We are glad to say that this result has now been achieved. The representatives of the Motor Union and of the Auto Cycle Club have met and have arrived at an agreement upon all points. An affiliation fee for motor-cyclists of 2s. 6d. will be proposed, which is within the means of every motor-cycle club, even on the admission of the local club whose circular is above referred to. In the case of those clubs already affiliated to the A.C.G.B.I. and the Motor Union which include motor-cyclists, the fees paid in respect of such cycling members will be reduced. Particulars of the proposed new arrangement will be sent shortly to the representatives of all the clubs. The arrangements will come before the General Committee of the Motor Union. This is the free Parliament of motorism, on which every club is and will be represented, and no other combination is necessary than is here afforded to enable the provincial clubs of this country to secure the adoption of any policy which they desire.—Yours truly,

W. REES JEFFREYS,  
Secretary of the Motor Union.

F. STRAIGHT,  
Secretary of the Auto Cycle Club.

### MOTORING IN SOUTH AFRICA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just returned from a most awful journey. We have had very bad rains in South Africa for the last three months, worse than

The Original Serpollet Steam Car. (See page 1107.)

they have been for the last thirty years, and in consequence the roads are in a terrible state with the wagon traffic. I was strongly advised not to attempt the journey, but a friend and myself gaily started from Grahamstown on December 29th, intending to get to King Williamstown that night and sleep there, distance seventy-four miles. This sounds nothing in England, but try it in this country with the roads in the condition they are now. We did the first thirty-five miles in great style, but, owing to the overflow pipe in the radiator getting stopped up, the steam blew out at the top joint of the radiator. We found an old native who could solder, and between him and myself we patched this up, but were seriously delayed. We then proceeded and got into the most hideous of roads, simply made up of mud holes. At one time the front wheel and near side driving wheel were absolutely buried and every minute I expected the car to turn over. Going into the hole stopped my engine, and my companion, in trying to get out, fell into another hole. He managed to turn the handle, and I backed out, and had another try, and the way the car wagged her tail and slithered and slid over that road was a caution! I never thought it was possible for a car to do such a thing. I assure you my respect for my Star car has gone up 1,000 per cent. since that adventurous journey. We reached King Williamstown in such good time, in spite of our adventures, that after staying there to refill both car and inner man, and returning the springs to their normal positions (they had jumped up), and a few other minor adjustments, we again started on a further voyage of discovery. We were told the roads to East London were impassable, but after our previous experience we thought this an exaggeration. The road was vile, with fearsome mud holes and sliding greasy places, lumpy surface, and cross drains which threw you nearly out of the car. We managed to do the further forty-six miles in something under three hours. We travelled, roughly, 120 miles in eight hours, being thirteen hours on the

road altogether. This is a really good record, as anyone will tell you if they know the roads and the state of them at this time. It would have been an absolutely impossible journey to have accomplished with a gear-driven car unless it had been given an abnormally high clearance, and then the car would have probably capsized. Give me a chain drive for these bad roads.—Yours truly,

W. FITZGERALD, M.D.

### ACCESSIBILITY AND CLEANLINESS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to Mr. A. E. S. Craig's letter on the above subject, I note that he speaks as if I recommended the use of a three-quarter Whitworth thread to keep on the road wheels. In this he is in error, as my statement was confined to the use of a hexagon on the nut the same as three-quarter Whitworth. In the case of the front wheel, this hexagon is used on a spindle which is .826 in diameter; the rear wheels are on a hollow sleeve, and the retaining nut is on a thread no less than 2.25 in diameter. The three-quarter nut which I mentioned holds the clutches which drive the rear wheels up to their work, the hexagon being repeated on the outside of the hub cap, so that the same spanner can be used in all cases. Trusting this will explain matters.

As there seems to be some misunderstanding with regard to the sizes of the other hexagon nuts I use, and a table of which I append, namely, that they indicate the size of the threads as well, I should like to point out that these only indicate the sizes of spanners necessary. In the case of the largest hexagon which I use— $\frac{3}{4}$  in. Whitworth—the size of the thread with this may increase as much as 2.437 in. over the top of the thread, but in cases such as this the nut in question would be an internal one, and the hexagon would be a boss on one face of it. It may be of interest to add that it has been found impossible to confine diameters of threads used to quite so small a number as the nuts.

Size.			Over Flats.	Over Corners.
No. 1 suits 1 B.A. and	0 B.A. threads		.375 ...	.433
No. 2 " $\frac{1}{4}$ Whitworth and $\frac{1}{4}$ Gas	"		.525 ...	.606
No. 3 " $\frac{3}{8}$ " " $\frac{3}{8}$ " "	"		.709 ...	.819
No. 4 " $\frac{1}{2}$ " " $\frac{1}{2}$ " "	"		.919 ...	1.06
No. 5 " $\frac{3}{4}$ " " $\frac{3}{4}$ " "	"		1.301 ...	1.5

and all larger sizes.—Yours truly,  
F. LEIGH MARTINEAU.

### CASE-HARDENING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If Mr. Letch, who wrote last week for information on this subject, would care to pay a visit to the Talbot works, he will see, if not the best, one of the best and most complete plants for case-hardening that can be seen anywhere; both in respect of case-hardening to any depth, and giving a degree of hardness certainly harder than glass, but at the same time leaving the part unbreakable. I am sending you a little specimen which shows the combination of hardness and toughness. Another specimen shows the usual depth that small articles are hardened to.—Yours truly,

C. R. GARRARD.

### SMALL STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Broughton's letter *re* the above, in the last issue of the *M.C.J.*, is a sure sign of the increasing interest taken in steam as the well-tried and successful power for motor-car work. We find the much-abused Locomobile can be converted into a very fine little car at a moderate cost. By fitting a flash boiler there is no waiting for steam, as any demand can be instantly met. Paraffin fuel can be used, which is cheap and obtainable anywhere. No torch is required to start, and the burner can stand for any length of time without restarting. Hand-pumping is entirely done away with by fitting air-pump to engine, which can be regulated to any desired pressure. Bucket work is also done away with by fitting a water lift and hose, so that the water tank can be filled in a minute or two without dismantling.—Yours truly,

MORRIS BROS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. C. Broughton's letter *re* small steam cars, in the last issue of the *M.C.J.*, I think I can furnish him with some particulars. Several good steam cars can be picked up at almost a taking away price, and with an additional expenditure of between £50 and £70 they can be brought up to date, including a paraffin burner. I think the best value in the way of a second-hand steamer is an old 6-h.p. Serpollet, which car burns paraffin. The running cost of cars which burn that fuel at 6d. a gallon is very small, as a 10-h.p. car will run about eighteen miles to the gallon. Oil lubrication costs little—much less than on a petrol car of similar power. Cars that do not condense their exhaust steam and return the water to the tank will run about thirty miles, according to the size of the water tank, without refilling, and that operation can be performed by a steam injector in a few minutes. To light up and have full pressure of steam requires about eight minutes, when there is no further trouble for the day. The old-fashioned torch is

obsolete in modern cars. The speed of a 10-h.p. car on the level would be about forty-five miles per hour, and on hills it would be equal to a petrol car of treble the power. I would suggest that your correspondent put himself into communication with Messrs. H. E. and F. Morris Bros., 82, Stroud Green Road, Finsbury Park, London. They are practical steam engineers and at present are building small steam cars. They do a large trade in cars of that class, and I feel confident they would be able to meet his requirements. I may mention I have no interest in the firm beyond a scientific one, but, having had practical dealings with them, I can testify to their work being thorough and of a high order.—Yours truly,

J. C. P. PERRY.  
Major, R.A.M.C.

### DIAMETERS OF INLET PIPES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if you would kindly inform me the sizes of inlet pipes used for different powered petrol engines. For instance, I have a 12-16-h.p. motor which has an inlet pipe  $1\frac{1}{4}$  inch diameter; are all 12-16-h.p. engines fitted with  $1\frac{1}{4}$  in. pipes, irrespective of make? Can you give me a scale of the sizes of pipes for engines of different powers?—Yours truly,

PIPE.

[The question that governs the diameter of induction pipes is principally the bore of the cylinder. "Pipe" says he has a 12-16-h.p. engine with a  $1\frac{1}{4}$  in. pipe, but he does not tell us how many cylinders there are. Now, whilst the power he states can be got comfortably with four cylinders and a pipe of about the area he mentions, such a size would be altogether too small for the engine if it has two large cylinders. Granted that the cylinders are the same bore, the same size induction pipe approximately may be used for a one, two, three, or four cylinder motor. Our correspondent will be interested to study a catalogue of the Longuemare carburettors, in which he will find in millimetres the sizes best suitable for engines of different powers. It is impossible to give a hard and fast scale, as there are so many variable factors, but roughly we think he may take it generally at about one-third the bore.]

### THE CONSTRUCTION OF AN INSPECTION PIT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The arrangement of one of our metal inspection pits placed at right angles to the usual position, as described by Mr. Searth in your last issue, is a novel one, though, in view of the increased accessibility, it has much to commend it. We cannot, however, agree that 3 ft. is deep enough for all round work, as the operator's head at this depth comes unpleasantly in contact with the dirty under portions of the car. This is to a great extent avoided if the depth is 4 ft., and it is obvious that it is better to have a pit a little too deep than not deep enough, as the former can be remedied by a little packing up or by an adjustable floor that can be supplied when required. We think, therefore, that those about to construct pits would be wise not to adopt anything less than 4 ft. deep.—Yours truly,

F. W. BESANT AND CO.

### SUBSTITUTES FOR PETROL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Edge's remarks in the last issue of the *M.C.J.* on Borneo spirit for motor-car work, I have been using the spirit since October last to run my car. It has been out every day, and during all sorts of weather, including the heavy snowstorm, and my chauffeur reports that it is cleaner and better than the usual spirit and cheaper, and only in the very coldest weather have we required to use some small amount of heat to get it to vaporise. I am so satisfied with it that I shall continue to use it.—Yours truly,

A MEDICAL PRACTITIONER.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The motoring Press generally have given prominence to a comparative test, by Mr. S. F. Edge, of Borneo '760 gravity spirit with Pratt's motor spirit, in which report Mr. Edge sums the test up by saying that "Borneo spirit could be used with perfect confidence by motorists, but when the engine is quite cold it is a little more difficult to vaporise." As proprietors of Pratt's motor spirit, we beg to call your attention to the fact that for over six months the Anglo-American Oil Company, Ltd., has placed upon the market a motor spirit of '760 gravity, which in our opinion is superior to any other spirit of that gravity now being offered. It is made from Eastern (Sumatra) crude—the entire production of one field of which we control. From our standpoint we should be delighted if motorists would use this heavy spirit, and as it sells at 1½d. per gallon less than "Pratt's" or other motor spirit, of lighter gravity, there should be an actual inducement to motorists beyond their desire to open up additional sources of supply.

The fact remains, however, that there are a large number of motor-cars now running in this country the carburettors of which are adapted only to spirit of light gravity, and, in view of the impossibility of a general change in existing carburettors, we shall steadily resist any move to appreciably increase the gravity of our "Pratt's" brand of

motor spirit. For those who can use the heavier grade it is now, and has been for some months available, so that it only remains for the motorist to elect which spirit he shall use in his car. Without desiring to controvert Mr. Edge's statement in any way, we regret to add that in our opinion the heavy spirit cannot "be used with perfect confidence" by all motorists, but only where the carburettors are properly adapted to it. Whichever spirit motorists may call for, "Pratt's" or "Anglo's '760," they can rely upon these brands being entirely uniform in quality.—Yours truly,

F. E. POWELL.

### A TOP GEAR DRIVE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of January 26th a letter from Mr. S. F. Edge, in which he enumerates certain performances of the Napier six-cylinder car. The first of these is:—That a 30-h.p. car was driven from Brighton to Edinburgh on the top gear—including running at from 5:32 to over 46 miles per hour. The second is:—That the same car ran 200 miles on an average petrol consumption of 18.78 miles per gallon.

Will Mr. Edge be good enough to state definitely whether the car was identically the same during each of these performances, or whether the ratio of gear was considerably altered? Will he also state approximately the petrol consumption during the Brighton-Edinburgh run, and the number of revolutions per minute made by the engine when the car was being driven at over forty-six miles per hour on the same journey?—Yours truly,

P. M. B. H.

### TIMING A PETROL MOTOR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I own a 10-12-h.p. two-cylinder Tony Huber car. I have lately reset the timing. I find the exhaust lifts after about 5-6ths of

[At a French "Octroi"—Gallantry before Duty.]

the stroke, and does not close till about 1-6th of the suction stroke. The suction and exhaust valves are therefore both open at the same time for a little distance of the travel. Should I reset the timing so that the exhaust closes at the exact top dead centre or perhaps a little before? If I do so, the intake valve will of necessity open earlier (perhaps too early), it is mechanical. I will also loose the power of the gases earlier. I shall be glad if you will advise me. It might interest you to know how I corrected a fault in the trailer fibre wheel on the timing shaft, the one which carries the motion from the crank shaft spur pinton to the cam spur. The wheel was cut wrong by a certain motor garage firm, the teeth being, in my opinion, too thin, allowing of a great amount of backlash on the cam shaft. I have, therefore, cut the wheel into two complete wheels, advanced one 1-8th in. of its other part, riveted both together, and they now act as one wheel as before, only the teeth are so much thicker and all backlash has disappeared.—Yours truly,

W. J. BEECHER WARD.

[With reference to the above query, the exhaust valve should close on the top of the stroke and not in anyway overlap the opening of the inlet. If, of course, all the cams are fitted to the same shaft, it would necessitate a slight alteration of the position of the cams, but if they are on separate shafts this setting can easily be altered by simply letting the gear back a tooth.]

### HAND BRAKES—PUSH-FORWARD OR PULL-ON LEVERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—An examination of the cars at the recent shows reveals that in many respects the control mechanism is rapidly becoming standardised. There is one feature, however, in regard to which the cars are nearly equally divided, and that is the operation of the hand brake. In many vehicles the side lever is pulled towards the driver to put on the brakes, while in others the lever is pushed forward to accomplish the same object. These methods being directly opposed, a person accustomed to

one finds it very awkward for a while to use the other. One maker will claim that the pulling action is better, while another will say that it does not require as much time to grasp the push handle, as it is normally close to the seat. Personally I do not see much choice between the two systems, but I think that either one style or the other should become the standard.—Yours truly,

W. R. BAKER.

### A RENAULT CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should feel obliged if you could give me any information respecting the following trouble with a 10-14-h.p. Renault. When the car is running I hear a popping noise, which I think is in the carburettor; the vehicle has an automatic throttle. Also should the exhaust valve come flush on to the tappet? It does not hit it when working, but leaves a gap about a quarter of an inch. The car is a four-cylinder one, 1906 pattern. When starting up the engine there does not seem to be much compression, although I have just recently well ground all the valves.—Yours truly,

B. PERCIVALL.

[The popping noise, in this instance, may be occasioned by the admission of too much air, and the supply might be somewhat adjusted to allow a little less. No doubt the loss of compression has also a deal to do with the trouble, as the mixture for a high compression can neces-

### SIX OR FOUR CYLINDERS?

THERE was a very large gathering of the trade at the Automobile Club on Thursday evening last week, when, under the chairmanship of Mr. Worby Beaumont, Mr. S. F. Edge opened a discussion on the much-talked-of topic of six or four cylinders. By way of commencement Mr. Edge pointed out that in connection with the evolution of the Napier six-cylinder engine the one idea had been to make the most suitable powerful motor for a motor-car, and they had taken as the governing factors:—First, that weight must at all costs be kept down. Secondly, that the horse-power required is over 30-h.p. Thirdly, tyres are in the upkeep the most expensive portion of a motor-car, and to reduce wear and tear on them is of primary importance. The drawback to the Otto type of engine was that three of the strokes in the cycle were practically wasted. Early engineers got over this fundamental trouble by adding to the weight of their flywheels, but as the power and the size of cylinders increased, the amount of compression to be overcome and the difficulties to keep the engine running smoothly increased also. Flywheels had other drawbacks than that of mere weight. To give a smooth drive to a four-cylinder engine necessitates a flywheel of large proportions, with the inherent defect that tyres have to be worn out and petrol expended in merely carrying it along as so much dead weight. With the view of proving that a six-cylinder engine is not as heavy as, but indeed lighter than, a four-cylinder of equal power, Mr. Edge gave the

Touring in France.—The Cathedral of Le Mans.

sarily be slightly weaker than that for a low compression. The space between the exhaust tappets might to advantage be lessened to 1/8th of an inch. The loss of compression may be caused by the piston rings working round, thereby letting all the joints be in the same line.]

### DIFFICULTY IN STARTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have found great difficulty in starting my two-cylinder car during the recent very cold weather. I should be glad if some of your readers would kindly assist me with any useful hints. I have high tension accumulator and low tension magneto ignitions. The cells were charged about a fortnight ago. When once the engine is warm no further difficulty is experienced.—Yours truly,

R. HARMEN.

[It is a very common occurrence in cold weather to experience difficulty in starting up, owing to insufficient carburation. If, however, a little petrol is injected into the cylinders, this trouble will soon be overcome; this can be done through the compression taps by means of a small oil-can carried for the purpose.]

PORCELAIN.—A correspondent asks for the name and address of a firm able to supply porcelain for a plug he is about to put on the market.

respective weights of the parts of one of the latest Napier 40-h.p. six and a Renault 35-45-h.p. four. In the case of the first named the aggregate weight of the engine complete with flywheel and all piping was given as 681 lb., as against 706 lb. for the four-cylinder. The weight per horse-power was given by Mr. Edge as 14.7 lb. in the case of the Napier and 15.7 lb. for the Renault, but it is not clear from the figures given how this result has been obtained. After showing that the radiator rear axle and gear-box were all lighter on a six-cylinder car than on a four, reference was made to the relative lengths of the two types of motors. Taking the two cars above referred to, Mr. Edge showed that in the four the distance from the front of the forward cylinder to the back of the dashboard was 39 in., and 40½ in. in the case of the six. Mr. Edge, in reference to the question of mechanical efficiency, remarked that if this were the only desideratum, a single cylinder of enormous dimensions would be the correct thing for a high-powered car. Incidentally, however, it would pound itself to pieces, smash its gears, and ruin the tyres of the car. Less repairs are required with cars having four cylinders than those with two, and in his view the same holds good between four and six cylinders in favour of the latter. On the question of vibration, Mr. Edge gave the results of some comparative tests that had been made for him by Messrs. O'Gorman and Cozens Hardy, the same two cars being again chosen. Diagrams were thrown on the screen illustrating the results obtained, the movements, both vertical, transverse, and longitudinal, at various engine speeds, being

greatly in favour of the six. Turning to other matters, Mr. Edge remarked that the pulsations and syncopated beats of a four-cylinder were distressing to the mechanism generally if the engine speed of a four-cylinder was allowed to drop. This was a point that is entirely absent in the six, no matter how slowly it runs, and is owing to the overlapping of the impulses. He also claimed that six-cylinder cars had been found to be economical in petrol, probably owing to the fact that they are driven almost continuously on their top speed in traffic, and for longer on the "top" going up hills.

Mr. Edge summed up the advantages of a perfect six-cylinder motor-car as follows:—Smooth and even driving. Simplicity of carburation owing to smallness of cylinders and constant suction. Power applied in small quantities and oftener. Saving of wear in tyres, gears, chains, wheels, live axles, frame, crank-shaft, connecting rods, and all bearings. Absence of vibration giving extreme luxury. Absence of jerkiness, again, reducing wear and tear. Smaller flywheel required, reducing weight to be carried. High power obtainable with very small cylinders. Upkeep lighter through decreased wear of tyres, &c. Decreased weight owing to decreased weight of flywheel, lighter gears and transmission. Pull sweetly in mounting a hill down to the very last few revolutions. The pressure on each piston of a six-cylinder engine, power for power, is only a little more than half the pressure of an equal powered four-cylinder. Pistons and connecting rod lighter in a six-cylinder, the effects of inertia therefore not so great. Economical in petrol in spite of theoretical objections, due to driving on top gear. Owing to overlapping, engine will run more slowly and "pull" more slowly. Practically no change in speed required. Practically perfect balance. All parts of mechanism subject to less strain, therefore suffer less, and require less attention. More silent than a four-cylinder of equal power, other things being equal, because each cylinder fires a smaller charge, and has, therefore, less violent exhaust. Finally, the six-cylinder will develop its power, if desired, at 25 per cent. greater number of revolutions than a four-cylinder, with the result that the transmission can be 25 per cent. weaker, or, if of the same strength as would be required for the four-cylinder of equal power, would have a 25 per cent. extra margin of strength.

After a vote of thanks had been given to Mr. Edge, Mr. Beaumont threw the subject open to discussion; but, although there were a number of four-cylinder champions present, none seemed anxious to take up the cudgels on behalf of the four. After an awkward and uncomfortable interval Mr. O'Gorman rose and explained that he was not a six-cylinder enthusiast. In comparing six and four-cylinder engines, they had got an impossible proposition—a matter impossible to decide by any one individual opinion. In order to make a comparison they had to add together, as it were, apples and ideas, and they could not get a sum of six out of four apples and seven ideas. The difficulty was that they had to compare the value of eliminating vibration and getting a fairly constant torque with other values such as a certain economy of fuel, a certain shortness of wheel base, &c. The difficulty of giving an actual value to these things was so great that he personally had no definite opinion on the point whatever. There was a splendid case to be made out for either side, and the only real determining body—the judge of the whole matter—was the buying public. He thought that Mr. Edge's picturesque statement about the striking of blows was just picturesque and no more. There was no explosion in an explosion engine, but only an inflammation of mixture, which was a comparatively slow process. One of the matters which came out very strongly in the course of making calculations with regard to six four-cylinder engines was the very remarkable effect of the moment of inertia of the reciprocating parts. Curves could be plotted which would show that, by comparing two curves of the six and four cylinders of the same power, the six-cylinder car would apparently have a better ratio of maximum to mean turning moment. Taking cars over all the early speeds, beginning with the slowest speed, and going forward to a certain point, and then taking the weights which he had of actual cars, they would get a spell of speeds during which the four-cylinder car actually had the advantage as regards uniformity of turning moment. Then they resumed superiority for the six-cylinder car, and the latter continued to give a better turning moment. As to about 300 revolutions being the lowest speed for four-cylinder cars Mr. Edge was not quite fair. He (Mr. O'Gorman) knew a car which could run at 120 revolutions a minute. He also knew of a two-cylinder car with which they had got 80 revolutions.

Mr. J. E. Hutton thought there was a great deal to be said for both sides. If people came to him and said which car did he recommend he asked them what they wanted it to do. If they wanted a car to go slow with a maximum of luxury, he suggested the six-cylinder, because for the purposes of what the French call "promenade" he thought the six-cylinder was the best. If a man wanted to get a maximum speed and efficiency from his car he preferred the four-cylinder. As regards weight, he had been in hill-climbing and other competitions in which the cars have had to be weighed, and he had always noticed that the six-cylinder car approximated two tons while the four-cylinder cars were nearer one ton than two. If, as Mr. Edge had stated, the petrol consumption of the six-cylinder car was in advance of the four-cylinder car, why did not he build a six for the Tourist Trophy Race? It certainly seemed to him that to get the same power there have to be two more cylinders, fifty per cent. more crank shaft, and the engine must weigh nearly fifty per cent. more than in the four cylinder. Everything must be longer in the six than in the four cylinder, and having regard to the fact that they must have a lengthened wheel base it was difficult to see how the car could be anything as light as a four-cylinder.

After Mr. C. Johnson had read a communication from Mr. Royce, Mr. Frederic Coleman asked whether Mr. Edge had ever had time enough to count the parts in the six-cylinder engine, and if so, what were the actual number of parts, including the fly-wheel, as compared with those in a four-cylinder engine. He thought the question was rather important, because people did not put parts in an engine except for the reason that they were necessary, because they had to consider the weight. If the number of parts was distinctly different, the advantage would surely go to the one that had the least number.

Mr. C. Jarrott, in commencing his remarks, referred to the fact that the advocates of the four-cylinder had had so many figures given them that he personally was almost bewildered. They had been told that the six-cylinder car used less petrol than a four-cylinder. As against that they had a very cordial letter from Mr. Royce, in which he asked for a larger petrol allowance for six-cylinder cars. Mr. Jarrott was very sceptical as to the vibration tests, remarking that he wished he had selected the four-cylinder car, because then perhaps they might probably have had a little better record on the other side. He thought the figures would have been much more valuable, with all deference to Mr. Edge's statistics, if they had been conducted by an entirely disinterested person. A six-cylinder car had taken part in the Town Carriage competition held by the A.C.G.B.I., and the only point in which the six-cylinder had scored over the four-cylinder was under the head "accessibility in regard to repairs." He could mention a number of cars which would be more suitable than the Renault which Mr. Edge had taken for the purpose of drawing a comparison in regard to weight. The six-cylinder was a nice car to go slow on, and when one got beyond that point the difference between the two types became appreciably less as the speed increased. Summing the whole question up, they had to look on the construction of motor-cars as being articles of utility. The trend of design had got to evolve to the point at which they could obtain a vehicle which was the best for all round purposes. Take the cost of the manufacture, the accessibility of parts, the ease of driving, the expense in upkeep, and other various points, and they might have one or two particular advantages by having six cylinders, but having regard to general requirements they were as near perfection with the four-cylinders as they could get. The six-cylinder car was built with one or two advantages for a particular class, but the great future of the petrol engine unquestionably lay in the evolution of the four-cylinder.

Mr. J. S. Critchley, in respect to Mr. Edge's statement that a six-cylinder engine weighed less than a four-cylinder of the same power, asked, if that was so, why not increase the number of cylinders and have eight, and get less weight still. Increasing the number of cylinders did not get over the difficulty of the Otto cycle, and he thought a great number of developments were taking place that would possibly reduce the number of cylinders.

Mr. J. D. Siddeley remarked that to his mind the whole question resolved itself into one of expense in original cost, in running, and, he believed, in maintenance. Should anybody desire a car of moderate power he would be well advised to purchase a four-cylinder car. Should that person, however, desire to purchase that which had the most kudos to start with from an expense point of view, and at the same time obtain perhaps a more perfect looking machine when standing still, and also wish to have the most powerful car with the least disadvantages, he would be well advised to purchase a six-cylinder. When dealing with high powers it was largely a question of certain disadvantages arising from their use. In the one case they had four very big cylinders; in the other case, six moderate sized ones, and certainly in his opinion it was better to have six moderate sized cylinders than four big ones. When they were dealing with normal powers four cylinders were, however, quite sufficient. Much stress has been placed upon the question of economy of running and tyre upkeep. He ventured to assert that the question of tyre upkeep was altogether one, first, of weight of car, and, secondly, of the speed at which it was run. Under such circumstances they would find that the tyre bill would be the same in both cases. He ventured to assert most positively that with an equally-powered engine and similar gear, a four-cylinder car of equal power would hold its gear on a hill as long as a six. He was quite sure that a good many experienced persons would bear him out in that.

Others who took part in the discussion included Professor Sharp, Mr. Oscar Thompson, Mr. Egerton, and Mr. Knowles. As the hour was late, it was at first proposed to postpone the discussion, but eventually Professor Hele-Shaw undertook to deal with the matter from a scientific aspect at a later date. The Chairman thereupon called upon Mr. Edge to reply, in the course of which he mentioned that there were sixty-four more parts in a six-cylinder than in a four.

THE Coventry Chain Company, Ltd., remind agents that their attractive showcard may still be had for the asking.

AT 63, Walm Lane, Willesden Green, N.W., the Middlesex Motor Carriage Company, Ltd., have opened a garage capable of housing more than thirty cars.

FOLLOWING the exhibition, the first motor auction sale ever held at the Crystal Palace was successfully carried out on the 11th and 12th inst. by Messrs. Friswell (1906) Ltd. Some of the cars exhibited had a reserve placed on them, and our readers, who were not able to get to the Crystal Palace Exhibition, will find some of them on view at the auctioneers' show rooms at Albany Street, Regent's Park, N.W.

## CLUBS AND ASSOCIATIONS.

### AUTOMOBILE ASSOCIATION.

THE annual dinner of the Automobile Association was held on Tuesday at the Hotel Cecil, London, under the chairmanship of Col. W. J. Bosworth. More than 450 gentlemen were present, including the Marquis of Ailsa, Earl Russell, Lord Montagu, Lord Denman, the Hon. L. M. St. Clair, the Hon. Lionel Walrond, M.P., Mr. Percy Barlow, M.P., Mr. Herbert Raphael, M.P., Mr. Sidney Straker, Sir W. G. D. Goff, Bart., Count Ward, G.C.V.V., Mr. J. Schlentheim, hon. treasurer, Colonel Montague Day, Dr. Stilwell, Mr. S. Hope Morley, Capt. F. Attenborough, R.N., and Mr. Otto Shaw, J.P. The following members of the Committee of the A.A. also attended:—Messrs. Chas. Jarrott, S. F. Edge, Chas. Temperley, Alfred Harris, Amery-Parkes, H. S. A. Smith, D'Arcy Baker, Chas. Cordingley, and Capt. Bennett-Stanford, J.P., with Mr. Stenson Cooke, secretary.

After the loyal toasts had been honoured.

Mr. Mostyn Piggott proposed the toast of "The Automobile Association." He said he was glad to note that a motor-car was accompanying an expedition to the South Pole. There were others, he was aware who would like all other automobiles to go to the same place. Some police restrictions were put upon motorists, but the fashion might change and it would not surprise him if, during the throes of versification, a policeman, with a rhyming dictionary in his hand, interrupted

"United We Stand, Divided We Fall."

The sketch by Mr. Tom Browne, R.I., for the menu of the Automobile Association's Dinner on Tuesday last.

him with the remark that there were more feet in a certain line than authorised by statute. He counselled patience. A certain gentleman at Olympia insisted on being ridden over twice a day by an automobile. British common-sense might learn a lesson in patience and fortitude from this excellent example, and the thing would soon become a pleasant pastime.

Colonel W. J. Bosworth responded to the toast, and said that when last they met the membership was 300, now it was as many thousands, including a hundred peers of the realm and many hundreds of other distinguished motorists. It was Mr. C. Jarrott who placed the first body of patrols on the Brighton road, and the success of their Association had justified that initial effort. Their successful existence had been due to the fact that their services were needed, and that their committee had worked harmoniously and vigorously in the interests of the motoring community. With regard to the police, he referred to the transformation that had taken place in their comportment, mainly owing to the work done by the Association. The authorities had begun to recognize that so far from encouraging the Hooligan driver the Association did everything possible to put him down. During the past year the number of patrols had been enormously increased, and the roads to Liverpool, Blackpool, and Edinburgh had also received attention. England had become honeycombed with agents of the Association, and at no distant date they hoped to see every village supplied with a distinctive name-plate. The prosecution of carmen and others who obstructed motorists had been undertaken, and arrangements made whereby, on payment of a small sum, their

members were provided with legal assistance. Negotiations with Lloyd's had been made to ensure the issue of a very favourable motor-car policy to members of the Association, securing not only low rates of premium, but a rebate should no claim be made during the year. A scheme for the organisation of a body of guides in all large towns in England was being formulated, and in conclusion the Colonel enumerated the following advantages obtainable for the two guineas subscription of members, namely, the service of patrols, agents and guides, legal defence on reasonable lines, exceedingly favourable, insurance assistance when touring on the Continent, and the provision of danger signals and village signs throughout the country. Cordial relations were being continued with existing associations, and he trusted that this friendly state of affairs might long continue.

The toast of "The Press" was proposed by Mr. Charles Jarrott, who eulogised the service rendered to the Association by the newspapers associated with the industry. Responses were made by Messrs. H. Massao Buist and H. W. Staner.

Sir Archibald Macdonald, Bart., J.P., vice-president of the Association, proposed the toast of "The Visitors," on whose behalf Mr. Barry O'Callaghan, replied congratulating all responsible for its progress.

Following the speeches was an entertainment, which was well maintained till a late hour.

### THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

A FIRM, which is a member of the Automobile Mutual Protection Association, and which imports cars to all parts of Europe, has introduced into its 1907 pattern an improved engine base, in which a continuous web is cast between the lower half of the engine base and the side members of the chassis frame. This forms a protecting plate to prevent the access of dirt and mud from under the car to the valves, stems, and engine generally, as well as affording convenient means of securing the magneto, carburettor, and similar accessories. This is an obvious improvement in the gradual evolution of the motor-car engine, and several makes of cars were fitted with it at the last Olympia Show, and many other makers are talking of its adoption.

The firm in question received notice, through their German agents, that they were infringing a patent dated 1904, and threatening them with the usual dire penalties. They accordingly communicated with the Association, and asked them to go into the matter and advise them what to do. The Association has had a very careful search made of the patent records, and they have found that the particular patent in question was only taken out in Germany, and was not taken out in this country or in France, but a very similar patent was taken out at a later date, which it is possible the patentees might try to use as a master patent in this country. In order to assist the member, the Association went very carefully through all patent specifications that had been filed, dealing with engine design, and they have discovered a patent dating from 1901 which fully anticipates all the later patents, claiming the use of a web casting extending from the base chamber to the frame. This patent goes so far back that the drawings only illustrate its application to tubular frames, and the patentee makes no claim for the principle of the web, but his drawings so clearly indicate that was his method of construction, that they are sure to be ruled as completely anticipating these later patents.

### AUTO CYCLE CLUB.

THE Auto Cycle Club's Silencer Competition will take place on Tuesday, the 26th inst., at the Clement-Talbot works, Ladbroke Grove, Notting Hill. The club is to be commended upon taking this matter up, for undoubtedly a great deal of the prejudice which exists against these machines is caused through the excessive noise which they make. Entries for this competition close on Tuesday next, and full particulars can be obtained from the secretary, Mr. F. Straight.

The club is also offering a prize of five guineas for the best design suitable for their certificate which is awarded in the various trials and competitions promoted by them. Designs should be emblematical of a motor-cycle as far as possible, but not representative of any particular make. All designs submitted to become the property of the club. Further particulars can be obtained from the secretary, Auto-Cycle Club, 18, Down Street, London, W.

### INSTITUTION OF AUTOMOBILE ENGINEERS.

THE following is an extract of the contribution to the discussion on the paper on "Accessibility and Cleanliness" read by Mr. F. L. Martineau, made by Mr. R. W. Buttemer. Much inaccessibility is due to the division between chassis construction and body building. A car should be a perfectly designed unit, and the union of a chassis stiff enough to stand alone to a body with similar qualifications is a shocking waste of good material, apart from the partial incompatibility of the two as regards accessibility. The detachable body is hardly more than a way of making the best of a bad job, while, as there is a striking and successful application of the above proposition among our own makers and another interesting effort shown at the Paris Salon in the Sanchis chassis, example of the direction that design should take is not lacking. The actual, if not the proportionate, number of owners who attend to their own minor repairs is increasing, and it is not, from some-

points of view, desirable to discourage the owner who wishes to dissect his car. Even if, like the Irish cycle repairer, when he puts it together he has "parts enough left to make another," the educational value of the process is considerable. I am inclined to take exception to the use of spring washers for the castle nuts of what one may call "permanent" joints. A castle nut in such a position should be carefully fitted till its pin reaches its hole, and a spring washer tempts the unconscientious repairer to leave it a sloppy fit. It is very desirable that the carburation, ignition, and cooling systems should be open to inspection and adjustment without disturbing passengers, and I would add to this the taking up of the brakes, or, at least, of one of them.

Perhaps a few actual instances of inaccessibility may fitly conclude these remarks.

Car A.—Tightening big end involved removing bolts holding fly-wheel, and also making a special cramp to draw a dished pinion of timing gear, before crank case could be divided.

Car B.—Re-leathering clutch involved detaching gear-box and brake-work.

Car C.—Refitting big ends involved detaching radiator and breaking a soldered joint.

Car D.—Tightening a loose nut in bracket at base of steering column involved the removal of about three dozen nuts, holding undershield and other parts, and each of these required a spanner at each end to detach. All bolts should have a key or pin to prevent rotation, those in the links of spring hangers particularly. And why do so few makers fit lubricators to these latter?

### THE MOTOR UNION.

By the courtesy of Mr. Charles Cordingley, says the last issue of the "Club Journal and Motor Union Gazette," members of the Motor Union will be admitted free to the Exhibition at the Agricultural Hall, London, on Saturday, April 6th (the opening day), and Thursday, April 11th, on production of their membership cards. A comfortable room will also be placed at the disposal of the members. The thanks of the Union have been conveyed to Mr. Cordingley for his kindness in the matter.

The car badge is now ready for members and applications for the same should be sent to the secretary.

### BLACKHEATH.

THE annual dance of the club was held on Friday of last week at the Concert Hall, Blackheath, nearly two hundred members and guests being present. Mr. Leonard Beadle (captain) acted as M.C.

The annual general meeting and dinner is now being arranged to take place on or about the 28th inst. at the Art Club, Blackheath.

The committee has voted the sum of two guineas towards the cost of the competition now being organised by the Roads Improvement Association at the request of the A.C.G.B.I. and the Motor Union for a tar-spreading machine.

### MOTOR YACHT CLUB.

At a meeting of the Racing Committee of the Motor Yacht Club last week the date for the British International Cup race was fixed for Saturday, August 3rd, and the eliminating race for the previous Saturday, July 27th.

The Reliability Trials for 1907 were fixed for Tuesday and Wednesday, July 30th and 31st. The boats will thus have to be in the dock on Monday (by midday) for the judges' preliminary inspection, and will be released on Thursday, August 1st.

### DUSTLESS ROADS COMMITTEE.

At the first formal meeting of the National Dustless Roads Committee, held at the Automobile Club, the following officers have been elected:—President, the Hon. Arthur Stanley, M.P.; chairman, Mr. Robert Todd; vice-chairmen, Mr. C. D. Rose, M.P., Major Coates, M.P., Sir William Hulton, Dr H. S. Hele-Shaw, and Colonel R. E. B. Crompton; treasurer, Lord Montagu of Beaulieu; secretary, Mr. Douglas Mackenzie.

### LADIES'.

THE report of the committee read at the fourth annual general meeting last week referred to a very satisfactory position both as regards the financial and social position of the club. The surplus of income over expenditure for the year 1906 was £594 10s. 8d., and in addition to this sum £1,200 is invested in Consols. Two illustrated lectures were given at the club during 1906, one by Mrs. Manville, entitled "A Try for the Herkomer Trophy," and one, "Hints on Motor-car Driving," by Lord Montagu. Several meets were held, the members having met by invitation at the homes of the Countess of Amherst, Mrs. R. C. Turnor, Mrs. Walter and Lady Salomons.

Mr. and Mrs. Cordingley entertained the club, on the 28th of March, at the Eleventh Annual Automobile Exhibition at the Agricultural Hall, and in November the Society of Motor Manufacturers and Traders invited the club to visit their Fifth International Motor Exhibition at Olympia.

The report is signed by Millicent Sutherland, president, Cecil Montagu of Beaulieu, Beatrice Rawson, Augusta Spencer Churchill, Marion L. Leigh, vice-presidents, and K. D'Esterre Hughes, secretary.

THE Lewisham A.C. climb on River Hill has been postponed to the 2nd prox.

THE annual dinner of the South Wales and Monmouthshire A.C. will be held at Cardiff on the 23rd inst.

MR. J. DAWBER, 9, Mariebone Place, Wigan, is the hon. sec. of the motor section of the Wigan Cycling Club.

MR. R. K. HUBBARD, 24, Sarum Hill, Basingstoke, is the hon. sec. of the Basingstoke and District Motor Club.

AT the inaugural meeting of the Dundee and District Motor Cycling Club Mr. G. D. MacDougald was elected president, with Mr. J. D. Cruickshank, 27, Albert Street, Dundee, as hon. secretary.

SEEING that there are more than one hundred motor-cycles registered in West Hartlepool, the local motor-cycle club now being formed, with Mr. W. T. Walton, jun., 71, Grange Road, as hon. sec., should soon become a successful institution.

### INSPECTOR JARRATT AS DEFENDANT.

AT the Reigate County Bench, on Saturday, Police Inspector Jarratt was summoned by Mr. W. G. Roberts, of the Westminster Bridge Motor Garage, Westminster Bridge Road, S.W., for assaulting him on October 7th, when he was stopped on the Brighton road for exceeding the speed limit. Mr. Staplee Firth, for Mr. Roberts, said the proceedings arose out of a case which had already been before the Bench, Mr. Roberts being summoned by Inspector Jarratt for driving his motor-car at a speed stated by the inspector to be 37½ miles an hour. Mr. Roberts said he was driving a motor-car containing Mr. and Mrs. MacConnell

Mrs. Adney Payne, who is seen at the wheel of the car in the above illustration, has recently undergone a course of motor-car instruction at the Institute of Chauffeurs, Westminster, and is now an accomplished driver.

and Mr. MacConnell, jun., from Brighton to London. On reaching Charlwood, near Reigate, he was stopped by a police-constable. Inspector Jarratt coming up shortly afterwards in plain clothes, witness asked him what he was stopped for, whereupon the inspector, turning to the constable, said: "Tell this man what he is stopped for," and the constable told him he was stopped for exceeding the speed limit. Witness was standing listening when Inspector Jarratt, who was cycling, wheeled his bicycle up behind him. Witness tripped and his foot came in contact with the wheel, whereupon Inspector Jarratt raised his clenched fist in a threatening attitude, and said: "If you do that again I will knock you down." After other witnesses had been called the defendant went into the box and gave his version. When Mr. Roberts's car was stopped he rode up on his bicycle and told him he had exceeded the legal limit. Mr. MacConnell immediately jumped up in the car and said: "How do you know? Who are you?" He told the constable to tell him who he was, whereupon Mr. MacConnell said: "Oh! You are the Jarratt, are you, that we have heard so much about—the well-known liar!" Witness took no notice of the remark, however, and went to speak to a cyclist who had stopped, and who complained of the way in which Mr. Roberts's car had been driven. He told Mr. Roberts about the cyclist, when Mr. Roberts deliberately kicked the front wheel of his (witness's) cycle. Witness said to him: "I shall protect my property, and if you kick it again I will knock you down." Asked by Mr. Firth to give his definition of "threatening attitude," the inspector, leaning across the witness-box with fist raised, said: "If I put

my fiat in your face like that I should call that threatening." The Chairman announced that the magistrates were unanimously of opinion that the case must be dismissed. An application by the defendant for costs was not allowed.

## CASES UNDER THE MOTOR-CAR ACT.

### NO LICENCE.

George Shaw, of Cheyne-walk, Chelsea, was summoned at the Acton Petty Sessions for driving a motor-car at Uxbridge Road, without being licensed. A police-constable deposed that a boy was knocked down by the defendant's motor-car, and witness was taking particulars. He asked for the licence, and when defendant produced it he discovered that it expired several days previously. Defendant's attention was called to the fact, and he remarked, "Yes, I didn't notice until the other day that it had run out, and I am going now to renew it." Alderman Wright imposed a fine of 40s. and costs, remarking that the defendant was liable to a penalty of £20.

### EXCEEDING LEGAL LIMIT.

Nicholas Wood, giving the address of Carlton Hotel, London, was summoned at the Brighton Borough Bench recently, for having unlawfully driven a motor-car at a speed dangerous to the public on the King's Road. Mr. E. E. Humphrys appeared for the defence, and asked that the summons should be altered to make the offence one of exceeding the speed limit provided by the Act, twenty miles an hour. To this the Chief Constable (Mr. W. B. Gentle) offered no objection. Outlining the circumstances of the case, Mr. Gentle said he had three independent witnesses prepared to state that the speed was twenty-five miles an hour. When the defendant had been spoken to by the police he had asked to see their stop-watches; but the Brighton police did not carry stop-watches; they did not lay traps for motorists. He did not suggest that any life was in danger through the driving of this car, but there would have been if, as might have happened, a number of people had crossed the road at that moment. His only object was to protect the public, and to let motorists understand that they could not drive at such a speed along crowded thoroughfares in Brighton. Mr. Humphrys then tendered a plea of guilty, and defendant was fined 40s. and costs, or fourteen days' imprisonment.

At Mortlake, Humphrey Beresford Fitzherbert was summoned for driving a motor-car at an excessive speed. Defendant did not attend, but sent a telegram in which he pleaded guilty to thirty miles an hour, and requested that the amount of the fine might be wired to him. The evidence of two constables showed that on the morning of the 23rd ult. they timed defendant's car with stop-watches over a measured furlong on Barnes Common, which it covered in 15 sec. A list of four previous convictions was handed to the Bench—two under the Parks Regulation Act, one for driving to the danger of the public, and one of a similar offence to that for which he was now summoned. The bench imposed a fine of £10 and costs.

### RECKLESS DRIVING.

William Other, of Blandford Street, Marylebone, was summoned at Westminster for driving a motor-car to the danger of the public at Buckingham Palace Road. Evidence was forthcoming to show that the defendant, in order to avoid a van, drove right across to the off side and collided with a four-wheeled cab, breaking a shaft and injuring the horse. Defendant himself admitted to a police inspector that he was travelling at fifteen miles an hour. Mr. Curtis Bennett said he thought that in London a pace of fifteen miles an hour was much too great, and it was much too fast even in small towns. He was satisfied defendant was driving in a manner dangerous to the public, and they must be protected. He imposed a fine of £5 and 20s. costs.

### IDENTIFICATION MARKS.

Under the Motor Car Act, Mr. T. Graham Sharp, secretary of a motor-car company, has been summoned at Westminster for aiding and abetting a chauffeur named James McGregor in using a car without the usual identification number, and further with failing to keep a proper record of the driver as required. Defendant pleaded guilty, and had nothing to say beyond admitting that he knew the book was not very well kept. The magistrate inflicted a penalty which, with costs, totalled £6 4s.

### NO LIGHT AT REAR.

At the County Hall, Derby, Harry Ford, of Brookside, Uttoxeter, was summoned for driving a motor-car without a red light at the rear, at Etwell, at 12.45 a.m. on January 25th. Mr. H. M. Clifford appeared for the defendant. Police-constable Ordish said defendant had no rear light on the car. Witness blew his whistle, but instead of pulling up defendant increased the speed of the car. Mr. Clifford submitted he had no case to answer. It was necessary, in the first place, to produce and prove the regulations of the Local Government Board. This had not been done by the prosecution.—This objection was upheld by the Bench, and the case dismissed.

## MODERN MOTOR VEHICLES.

At a meeting of the Institution of Civil Engineers on Tuesday last week a paper on "Modern Motor Vehicles" was read by Lieut.-Colonel R. E. B. Crompton, M.Inst.C.E. After referring to the rapid spread and growth of the automobile industry, to the historical side of the question and the development which has followed the invention of the petrol

engine of Daimler, the author gave a general description of the arrangement of the mechanism of the various classes of vehicles in use, dealing first with the motor-car employed for pleasure, a development of which is used for public service vehicles, and then with the heavier vehicles used for commercial purposes, such as traction engines, steam wagons, and parcel vans. These were discussed in three groups, namely, those using petroleum spirit, steam, and electricity. Lieut.-Colonel Crompton afterwards proceeded to discuss the general engineering questions involved, by comparing the road locomotive with the railway locomotive and went somewhat fully into the question of road construction and maintenance. Finally, he came to the important question of the cost of working motor vehicles in town and country, and summarised the statistical matter to which the second part of his paper was devoted. This gave running costs of traction engines, steam and petrol driven wagons, motor-omnibuses, and private petrol, steam and electrically-driven cars.

## COMPANY NEWS.

### NEW COMPANIES REGISTERED.

EXPLOSIVE TURBINE SYNDICATE.—£1,500. To acquire the British and foreign patents granted to E. Uhlenbuth in respect of a turbine worked by explosions of gas, and to adopt an agreement with the said E. Uhlenbuth and J. E. Lyndall. First directors: J. E. Lyndall and G. B. Barboni, both of Paris.

GRANADA MOTOR COMPANY.—£5,000. To acquire the business carried on by Helen G. Allen, at 20, Granada Road, Southsea, as the Granada Motor Company. First directors: Major A. H. Cox, Messrs. B. S. Millard, and A. W. B. Bromley. 20, Granada Road, Southsea.

CARBURATION.—£20,000. To adopt an agreement with Messrs. W. Gillett and M. D. Lehmann to carry on the business of motor and motor vehicle manufacturers, &c. First directors: Messrs. F. Gillett, W. Gillett, and M. D. Lehmann, two last-named being managing directors. 1, Acacia Grove, West Dulwich.

FOUR MOTOR WHEEL DRIVE COMPANY.—£1,000. 17, Cockspur Street, S.W.

ERNEST H. HILL.—£12,000. To take over the business of brass founders and manufacturers of motor accessories carried on by Messrs. E. H. Hill and H. Hill at Broomhall Street, Sheffield, as Ernest H. Hill. First directors: Messrs. E. H. Hill and H. Hill.

RENAUD SYNDICATE.—£11,000. To adopt an agreement with Seymour and Gordon, Ltd., and to manufacture and deal in motor-cars, carriages, &c.

THE ACADEMY OF MOTORING (1907), LTD.—£50,000. To acquire the business of the Academy of Motoring, Ltd. First directors: Messrs. L. C. Bartholomew, P. B. Adams, W. P. Adams, E. T. Wright, and L. R. F. Strangways.

DUSTABATERS.—£10,000. To acquire and work the Provisional Dustabo patents now worked by Messrs. T. Woolf and T. Murphy at 118-122, Holborn, E.C., as the Dustabato Company, to carry on the business of manufacturers of a mixture for laying dust. First directors: Messrs. T. Woolf, W. Bond, and J. C. Keeney. 118-122, Holborn, E.C.

THE INTERNATIONAL MOTOR-BUS SYNDICATE has been registered with a capital of £1,000.

W. T. CLIFFORD-EARP.—Capital, £6,000. To act as agents for the sale of motor-cars and vehicles manufactured by the Thames Ironworks, Shipbuilding and Engineering Company, Limited. First directors: Messrs. W. T. Clifford-Earp, D. Urquhart, W. B. Leach, A. F. Hills, R. Warriner, and H. C. Lafone. 16 Philpot Lane, E.C.

PARIS MOTORS.—Capital, £5,000. 18, Eldon Street, E.C.

METROPOLITAN STEAM OMNIBUS COMPANY.—Capital, £40,000.

MOTOR MANUFACTURING COMPANY.—£40,000. To acquire the business of the Motor Manufacturing Company, Limited (in liquidation).

At a meeting of directors of Friswell (1906) Ltd., an interim dividend has been declared for the half-year ended December 31st, 1906, at the rate of 6 per cent. per annum on the preference and 10 per cent. per annum on the ordinary shares.

## THE TYRE TRIALS.

FROM the references that have been made in some contemporaries with regard to the Tyre Trials it is possible that an erroneous impression may have arisen as to the reasons for their postponement. An account of what actually happened at the meeting between the Technical Committee of the Club and the representatives of the British Empire Motor Trades Alliance will make the position clearer. The B.E.M.T.A. delegates informed the Committee that the Alliance formally withdrew its offer to provide cars for the trials in view of the fact that the trials could not now be held in February or March of the present year, and the Alliance was quite unable to obtain cars during any other part of the year. The question of holding the trials in the spring of 1908 was discussed, and it was finally agreed that the Club should consider the following suggestions and communicate them formally to the Alliance in the event of a postponement being approved:—(a) That the Alliance should be asked if it would be willing to supply cars for Tyre Trials in the spring of 1908, and, if so, how many cars; (b) that the Alliance should also be asked if tyres would be supplied with the cars, and, if so, how many different makes, the Club to choose them from stock. The offer of the Alliance has been renewed for 1908.

### THE MANCHESTER MOTOR SHOW.

THE third motor-car show organised by the Manchester and District Motor and Cycle Trades Association was opened in the Zoological Gardens, Belle Vue, Manchester, on Friday last week. The venue is a novel one, as, in addition to the buildings in which the cars are displayed, opportunities are available for making trial runs in the grounds and for testing motor-boats on the lake. One of the largest stands is that of Mr. Henry Garner, of Nantwich, who is exhibiting examples of both the Beeston and Coventry Humber vehicles, as well as of the 14-16-h.p. and 16-20-h.p. Argylla. Messrs. Huntley Walker and Co., Ltd., have a large stand, the exhibit including a 40-h.p. Weigel, a 40-h.p. six-cylinder Darracq, a 20-28-h.p. Darracq landaulet and an 80-h.p. racer. Several examples of the well-known 14-h.p. Germain chainless cars, including one with a landaulet body, are displayed by Mr. Theo Masui. Mr. A. H. Meldrum, Timperley, shows two standard Swift 9-10-h.p. cars, each fitted with the "Swift" twin-cylinder engine, which did so well in the Scottish Reliability Trials last year. On the same stand is a smart 9-11-h.p. Swift three-cylinder doctor's landaulet. This is a new design, the steering wheel, levers &c., being worked from the inside. Mr. F. Zorrilla, Manchester, in addition to a J.P. car, has on view the chassis of a new local-built vehicle known as the "Empress." The vehicle, of which we give an illustration on page 1111, is of 14-20-h.p., and is fitted with a four-cylinder engine having high tension magneto ignition. The transmission is by a cardan shaft to a live axle. A new two-seated car known as the New Pick is shown by Messrs. L. F. Harvey and Co., Salford. It has been designed to meet the demand for

by the Meldrum Safety Starter Syndicate, of Hale, Altrincham. Mr. M. Rimmer, Liverpool, is present with a range of the Premier accumulators, motor lamps, and the Darius and Maxim non-skids; included in the miscellaneous exhibit of Mr. F. D. Na well, Manchester, we notice the Avery autovoice and box spanners, and the Kyl-Fyre fire extinguishers. The tyre exhibits comprise the Moseley, Harburg-Wien, Clincher, Dook-Swain, the Shrewsbury and Challiner, the Sirdar, Continental, Dunlop, Peter Union and Midland, and the Pegasus non-skid. The Show closes to-day (Saturday).

### THE NEWCASTLE-ON-TYNE MOTOR SHOW.

THE second annual motor-car show was opened in the Exhibition Hall, St. Mary's Place, Newcastle-on-Tyne, by Councillor J. Matthew Oubridge, J.P., the Lord Mayor, on Friday last week. There are altogether about one hundred stands, and, although there are no striking novelties, some of the cars on view have not previously been seen in the great ship-building centre. The North Eastern Garages, Ltd., occupy no less than six stands, their exhibit comprising examples of the Humber, Arrol-Johnston, Fiat, De Dion, Austin, and Renault vehicles. Messrs. Frank Little and Co. have a varied exhibit, the cars on view comprising a 9-10-h.p. Adams-Hewitt, a 16-h.p. Albion, a 14-h.p. Vulcan, and examples of the 20-h.p. and 30-h.p. Belsize cars. Hodgson's Motor Garage, Newcastle-on-Tyne, show the Cadillac, Swift, Talbot, Sunbeam, Darracq, Minerva, and De la Buire vehicles. A range of Humber, Enfield, Darracq and Clement cars is staged by Messrs. Turvey and Co., Sunderland, and Messrs. George and Jobling,

[General View of the Manchester Motor-Car Show.]

a four cylinder vehicle at a moderate price, and is fitted with an engine of 12-14-h.p. Examples of the 18-h.p. and 10-h.p. Star cars, including a polished chassis of the latter, are displayed by Mr. J. Garlick Looker, Heaton Chapel. The British Motor Company, Manchester, also show the Star, Stuart, and Starling cars; the Wolseley-Siddeley vehicles are exhibited by Mr. E. Whitehurst, and the Laurin-Klement and New Leader by Messrs. G. P. Cookson and Bros., while two examples of the Speedwell cars—25-30-h.p. and 10-12-h.p.—are staged by the Addison Motor Company, Liverpool. Other pleasure cars on view include the Rolls-Royce, Orleans, the 30-h.p. White steamer, the Globe, the Quadrant, with special cross-roller change-speed gear, the Rothwell, the Riley, the Gregoire, and the Airex.

A leading feature of the show is the representative collection of industrial vehicles which has been got together. The Lancashire Steam Motor Company, Ltd., display a 5-ton steam wagon, and also a 30 cwt. petrol van built for the Kodak Company. Steam motor wagons are also shown by Messrs. Fodens, Ltd., Sandbach, the St. Pancras Ironwork Company, Ltd., London, Messrs. Alley and Maclellan, Ltd., Glasgow, the Yorkshire Steam Wagon Company, Ltd., Leeds, and Mann's Patent Steam Cart and Wagon Company, Ltd., Leeds.

In the accessory section the exhibitors include the General Petroleum Company (Shell motor spirit), Messrs. W. Battye and Son, Wigan (motor clothing), Pratt's Patent Manufacturing Company, Dukinfield (silencers), and Messrs. John S. Morris and Son, Salford (oils and greases). A new safety starting handle for use in connection with petrol engines, and intended to prevent the operator receiving any injury in case of a "back kick," forms one of the novelties in this portion of the show; it is exhibited

Newcastle-on-Tyne, show the Argyll and Wolseley-Siddeley machines. Messrs. Henry Angus, Sanderson and Co., Newcastle-on-Tyne, are present with several of the latest Daimler cars, as well as a 12-15-h.p. Arrol-Johnston touring vehicle. A 40-h.p. six-cylinder Napier is on view at the stand of the New Rossleigh Cycle and Motor Company, Ltd., Edinburgh, as also a 10-12-h.p. Peugeot, and a 22-h.p. Berliet. Messrs. Chas. Grimshaw and Sons, Sunderland, also exhibit a 40-h.p. six-cylinder Napier fitted with a special touring body of their own construction. The display of the Cleveland Car Company, Darlington, comprises examples of the Rover, Gladiator, Rolls-Royce and Itala cars, a 40-55-h.p. of the latter make fitted with a double landaulet body by Messrs. Thorn, of London, being specially worthy of note. One of the largest exhibits is that of Messrs. Young and Co., including as it does Gregoire, Ridley, Ford, and Isotta-Fraschini vehicles. Special attention may be drawn to the luxurious bodies fitted to the 30-40-h.p. and 14-16-h.p. Fiat chassis shown by Messrs. Atkinson and Philipson. Two sizes of the Stanley steam cars—10-h.p. and 20-h.p.—are staged by Messrs. W. Galloway and Co., Gateshead, who also exhibit the "Stitch-in-Time" vulcaniser. Other pleasure cars on view include the Armstrong and Whitworth, Alldays, Mercedes, Panhard, Rapid, Singer and Pope-Tribune. As regards commercial vehicles, Messrs. R. A. Young and Co. are showing a 14-h.p. Frick 20 cwt. van, a 28-30-h.p. Durham-Churchill 3-ton lorry, and a 5-ton Stewart-Thornycroft steam wagon, Messrs. Frank Little and Co. display a Halley 20-h.p. petrol lorry and a useful van designed for loads up to 15 cwt., while one of the exhibits of Messrs. Henry Angus, Sanderson and Co. is an Arrol-Johnston 2-ton lorry.

The tyre exhibits include the Continental, Elastes, Gaulois, Le

Persan, Palmer, Michelin, De Nevers, Goodrich, and Radax, and among the non-skids are the Parsons and the Pullman. In the accessory section we note the Rushmore headlights, the Stepney spare wheel, Smith's speed indicators, and the Southall tyre gauge. A varied display of electric ignition apparatus is made by the Motor Ignitionisms Company, Newcastle-on-Tyne, which includes the Faraday accumulators and induction coils, and a new radiator made in accordance with Brewtall's patent is one of the novelties at the stand of Messrs. Frank Little and Co. The Show closes to-day (Saturday).

## ROAD REPORTS.

**FOLKESTONE**.—As an experiment the Folkestone Corporation is allowing Messrs. W. and E. Earl, of Aldington, Kent, to lay a complete street in the borough (Cheriton Place) to test their specially made tar macadam.

**HAYES (MIDDLESEX)**.—The operations in connection with the sewerage works in this district were a considerable source of annoyance to users of the road at the latter end of last year. They are now completed, and there is nothing likely to happen during the next few months to interfere with the comfort of motorists, so far as the roads are concerned.

**MILL HILL**.—Mr. M. K. North, Local Government Board Inspector, has held an inquiry at Hendon respecting the application of the district council for sanction to borrow £2,082 for improvement works in Birkbeck Road, Mill Hill.

**EAST SUSSEX**.—An important road improvement has been carried out by the East Sussex County Council and the Cuckfield Rural District Council in conjunction with the owners of the land involved. This is the rounding off of corners at several important cross-roads which had become dangerous owing to the traffic on the main London and Brighton road. The widening out of the road space at the Warninglid cross-roads has made a great improvement, a much clearer view being now obtained of any approaching traffic on either the main or the branch roads.

**WEST SUSSEX**.—Several roads in this area are being steam rolled, delays having previously occurred owing to the frost. Repairs are in progress in the villages of Poynings, Ashington, Westhampnett and also on the main road for Chichester to Midhurst.

**SCOTLAND**.—Mr. William Beardmore, of Glasgow, considers that the best roads in his district for motoring are those between Glasgow, Stirling, Perth and Inverness, and between Glasgow and Carlisle.

**FINCHLEY**.—The Finchley District Council are borrowing £2,000 to carry out improvements in Hendon Lane. The thoroughfare will be widened to a distance of 50 feet.

## PUBLIC MOTOR SERVICES.

THE Kilburn Tradesmen's Association are requesting the London General Omnibus Company to put on a service of motor-omnibuses between Willesden Green and Maida Vale station.

A MOVEMENT is being projected by some residents in Torquay to secure a capital of £1,500 for the purpose of continuing the running of the motor-buses in the borough.

A MOTOR-OMNIBUS, filled with young men learners, was running through Finchley the other evening on its way to London. When in Bullaris Lane the steering gear snapped, causing the vehicle to swerve on to the kerb. The omnibus brought down an electric lamp column, plunging the whole road into darkness. The front part of the omnibus was wrecked, and several of the occupants were injured.

LICENCES for ten motor vehicles to ply for hire in the city of Leeds have been granted by the Watch Committee.

MR. JOHN SHARLAND, a London omnibus proprietor, is about to sell 210 horses and twenty omnibuses, having decided to place motor-omnibuses on the routes from the Elephant to the Angel at Islington, and Earl's Court, S.W.; hitherto served by the horsed vehicles.

## MOTOR-CAR ACCIDENTS.

THE coroner for South Bucks held an inquest at Slough on Thursday of last week concerning the death of William Hawkins, of Slough, who was fatally injured by a motor-car on the Great Bath Road. The evidence showed that Edward Harrison, an American chauffeur, was driving Mr. Barron Redfern Russell from Oxford to London. Hawkins, who was slightly deaf and near-sighted, was crossing High Street, Slough, and was knocked down by the car. He died from his injuries three hours later. The driver said he sounded the horn twice and steered the car to avoid the deceased man, but the majority of the jury returned a verdict of manslaughter against him.

AN inquest has been held at Croydon on Archie Grant, aged thirteen, of Lingwood Cottage, Kenley, who was knocked down and fatally injured by a motor-car belonging to Mr. Henry Mackusick, of Nutfield, Surrey. The evidence showed that the boy suddenly ran in front of the car, which was proceeding at the rate of from seven to ten miles an hour. A verdict of accidental death was recorded, and the chauffeur was fully exonerated. Mr. Mackusick promised to give a substantial solatium to the parents and pay the funeral expenses.

## POLICE TRAPS.

THE police have re-commenced timing motor-cars over Barnes Common, along which motorists should be careful. LAST year's trap in the Loampit Vale, Lewisham, is again in working order.

## BUSINESS NEWS.

THE number of motorists who have adopted a petrol strainer to intercept any sediment that may flow from the tank towards the carburettor is so considerable as to provide a convincing proof of the need of some such fitment. Hitherto there has been found some difficulty in avoiding a slight leakage at this point, petrol being notoriously persistent in finding a way out if one exists. To remedy this defect the E. M. Bowden's Patents Syndicate, Ltd., have thoroughly remodelled their well-known petrol strainer and now fit a petrol-proof washer which completely obviates any possibility of leakage.

THE Daimler Motor Company, Ltd., have sent us a photo of six of their cars which they have just shipped to the United States.

MR. ANDRÉ A. GODIN has secured the British agency for the Boland motor pneumatic tyres, which have been on the market for some time in France.

MESSRS. ARGYLLS IRELAND, LTD., of 102, Grafton Street, Dublin, have been appointed agents in Ireland for the Spyker cars.

IN addition to their premises in Burlington Street, Bradford, the Jowett Motor Manufacturing Company have opened a garage in Grosvenor Road, Manningham Lane, in the same town.

MR. JAMES HALL has a commodious garage at 228, Stretford Road, Manchester.

WE have received from S. F. Edge, Ltd., a copy of the Napier instruction book which they have recently issued. It consists of ninety-four pages, and contains many useful hints on the care and driving of Napier cars. The book is freely illustrated, one of the diagrammatic sketches giving a plan view of the Napier six-cylinder chain-driven chassis with the name of every part against it. The instructions concerning various matters to be borne in mind by the chauffeur are written in plain, simple language, and where there is a possibility of more than one meaning being given to the instruction, it is helped out by an illustration. The concluding pages contain a set of very useful rules for motor drivers to follow, and an article on the correct way to turn corners.

ACTING for the Northern Automobile Company, Ltd., Mr. Alberi House held an auction sale of motor-cars at the Oak Lane Garage, Bradford, last week. About a score of vehicles were offered and good sales resulted.

MESSRS. FRISWELLS, LTD., have a large number of cars on sale at their Emporium in Albany Street, N.W., including a Spyker and a Germain car, each fitted with limousine bodies, and a 25-h.p. Peugeot identical with the winning car in the recent Reliability Trials in India.

MR. GORDON SMITH, of Messrs. A. Smith and Son, Ltd., has returned from the United States, where he succeeded in obtaining many contracts for speedometers, in spite of the forty-five per cent. duty that prevails.

HEWER'S CAR BODIES, LTD., have commenced operations in the new extension of the Lotus Works at Coventry, where they will be located for a few weeks. The new building now being equipped for the company's factory will be fitted with a complete installation of machinery and the concern will specialise on landaulets, as well as on standard types of vehicles for car manufacturers.

THE Rt. Hon. James Bryce, our new Ambassador to the United States, is taking a Daimler car with him.

THE Royal Agricultural Society's Show will this year be held at Lincoln from June 25th to the 29th.

MESSRS. LOWTHER AND SONS have removed from Fisherton Street to more central and convenient premises in Butcher Row, Salisbury, where all motorists' wants will be promptly attended to.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

[No. 416.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

WHILE ordinary persons were sleeping soundly on Friday last, Mr. Bianchi and a companion were "toiling upward in the night" towards the northern boundary of England. Mounted on a famous little car—the 9-h.p. Sizaire that won the Coupe des Voiturette in France last November—they left London at 8 p.m., and having bade farewell to Mr. C. Jarrott at the

foot of Barnet Hill, went on their way, but lost it, however, soon after—reaching Cambridge, many miles off their road. From thence they journeyed over a road resembling a ploughed track, and *via* Huntingdon struck the Great North Road at Norman Cross. A good spin took them to Stamford, and thence to Grantham, a straight run of 22 miles, was the worst bit of going all the way, owing to the camber of the road and the inches of mud that had to be encountered. Doncaster was reached at 7 a.m. and six gallons of petrol taken aboard; the engine running meanwhile. At Newcastle fresh supplies were taken aboard and an inner tube replaced. Leaving the northern city, excellent progress was made, and there was no hill that the car could not take on top gear. Nearing Berwick another car from London was found by the roadside, the town itself being entered at 7.30 p.m. Starting on Sunday again, Edinburgh was reached in the afternoon. During the journey of 470 miles, 18 gallons of petrol were used, the actual running time being 23 hours—a good performance when the condition of the roads is considered, and one that should arouse considerable interest in the tests which will shortly be given the car under official auspices.

### Compulsory Lighting of Vehicles.

At the end of last week thirty-six private members' bills were read the first time in the House of Commons. So far as the great majority is concerned nothing more will be heard during the present Parliament, and their sponsors may rove at will in other legislative endeavours. It will be interesting to watch what happens to the measure piloted by Major Leslie Renton, the Member for the Gainsborough division of Lincolnshire, the object of which is to render compulsory the carrying of lights by all vehicles travelling on the roads at night. This was in the first dozen places and may be discussed without the usual party cleavage being made the occasion for delay. Its provisions are so reasonable that there should be no difficulty in hastening its progress to the Upper House, but for the fact that many Scotch members and others representing purely agricultural constituencies have been approached by farmers and those engaged in similar pursuits, urging that such a measure will involve much expense, and, owing to the carelessness of carters and drivers, render them liable to fines galore. Motor-cars have to carry lights and so warn drivers of horse-drawn vehicles of their coming; why should not the great lumbering carts conveying produce, &c., to early morning markets make other drivers aware of their proximity? Innovations are always irksome, but M.P.'s should remember the changing conditions of our times and be prepared to insist on all classes of the community adapting themselves to the new order

of things. Hence the hope that the universal lighting of vehicles travelling in the darker hours of the day will be made obligatory and that public opinion will support local authorities in ensuring a proper regard of the law in the matter. The Bill has been set down for second reading on Friday, March 15th, and, although it applies only to England and Wales, its extension to other parts of the United Kingdom should not be a difficult matter.

### A Census of Accidents.

Or the making of papers on automobilism there is really no end, and all the learned and engineering societies seem to have been surfeited with discussions on motor traction during the last few days. At a meeting of the Automobile Club, Sir J. H. A. Macdonald has been showing how destructive is the horse when engaged in his ordinary work on the streets. Sir John has compiled a census of the accidents which came under his own observation as a reader of the newspapers between May and November last, discovering that 656 were concerned with animal drawn vehicles, 313 with bicycles, 242 with power vehicles, 152 with tramcars, and 13 with motor-bicycles. Probably the greatest surprise will be expressed with the large proportion credited to the tramcar—the vehicle that runs along its own track, and should never wander from the path set down for it by its designers.

### The Forthcoming Road Competitions.

Few competitions have aroused so much interest among public and local authorities as these trials, which have been organised by the Roads Improvement Association, to determine the best and least expensive method of treating roads with tar so as to render them dustless. The Roads Improvement Association have been officially informed that the Local Government Board will appoint one of their engineering inspectors to attend the trials of the tar spreading machines. H.M. Office of Works have also deputed an officer to watch the experiments, and report to the Board. The Chief Engineering Inspector of the Irish Local Government Board, Mr. P. C. Cowan, B.Sc., M.Inst.C.E., has been appointed one of the judges in the competitions, with the approval of his Board. There are two competitions, which are quite distinct. One is for the best machine for spreading tar over existing road surfaces, which will be judged entirely by the results of the operation, and the other is for the best preparation of tar for road purposes. Full particulars with regard to both competitions can be obtained upon application to the Hon. Secretary of the Association, at 1, Albemarle Street, Piccadilly, W.

### The Traffic of Cities.

THE transit of carriages and carriage horses over the Great Eastern Railway Company's line is on the decrease owing to the use of motor-cars. This is not suggested by the experience of one half-year, but Lord Claud Hamilton recognises it as a permanent trend of things that must be endured by those responsible for the conduct of the line. He complains, too, of the competition of trams and motor-buses in the suburbs, but rightly recognises that no attitude of hostility must be adopted.

B

In fact, the main hope for some of the railway companies that run into London will be to link themselves with the tubes and underground lines and so prevent the leakage that takes place into motor-buses from all the great termini. Altogether, however, the traffic problems of London are in a mutable state and none can quite foresee the appearance of our streets at the end of the next quarter of a century.

### The Scottish Trial.

THE reversal of the order of going over some portions of the familiar route of the Scottish Reliability Trial, which was humorously suggested by officials last year, is apparently likely to take place in June. This alteration will involve some deviations from the customary route, and lengthen the whole run by nearly a hundred miles, necessitating another day being spent on the journey. The roads south of Glasgow will be avoided, Edinburgh and Dundee will be omitted from the itinerary, and a run north will include Elgin, Forres and Inverness in the trip. Altogether the route will probably be one of 754 miles, with Perth, Aberdeen, Inverness, and Pitlochry as the resting places.

Bianchi on the 9-h.p. Sizaire Car, on which he has just made a run from London to Edinburgh.

### Organisation in the North-East.

WE would commend to the emulation of all automobile organisations the excellent work which has been done during the past year by the North-Eastern Automobile Association, which has 504 members, and concluded 1906 with a credit balance of £181. An energetic campaign was conducted amongst Parliamentary candidates during the General Election, and of the twenty-four members who represent the counties of Northumberland and Durham thirteen are honorary members of the association. The society was able to secure the withdrawal of an application for the closing of Quaker Lane, Richmond, against motor traffic, and has little complaint to urge against the police traps that have been in operation in the locality. At the suggestion of the association warning triangles have been erected at a large number of dangerous corners and hills in the district, there having been no fewer than seventy set up in the county of Durham alone. Other matters concerned with the road are having the attention of the association, which has apparently solved the problem of trade members to its own satisfaction, by declaring that it is "essentially a members' association, and members whose principal occupation consists in the manufacture or sale of motor vehicles or their accessories shall not be eligible for office."

### Motor-Buses.

LORD MONTAGU OF BEAULIEU has been lecturing before the Society of Arts on the subject of Motor Omnibuses. Last year, he said, such vehicles carried 184,000,000 passengers in London, as compared with 180,000,000 conveyed by the trams of the L.C.C. The average travel of the motor-buses in town varied from 90 to 120 miles a day. There was no evidence as yet that a suitable accumulator was approaching the commercial stage, but apart from the ordinary internal combustion and the steam types of vehicle there was a third, of which he could speak hopefully, namely, the "auto-mixte" system, in which electric power transmission was employed. One of the drawbacks of motor-bus traction had been running cost, which, however, could now stand comparison with that of any other mode of public traction. Altogether Lord Montagu was hopeful as to the future of the motor-bus. Meanwhile many of the ordinary daily travellers on such routes as those which run along the Strand are wondering what has become of the vehicles that were in service there only a few weeks ago. There has been a decided decrease in their numbers, with the result that the number of horse-vehicles still running seems wholly disproportionate when considered alongside of the progress made elsewhere in the Metropolis.

### Club Garages.

AT Derby the members of the County Automobile Club have been discussing the provision of a garage, such being recognised as a good way of interesting country members in the organisation which operates with the town of Derby as a centre. Some discussion took place at the annual meeting last week in regard to the question, to consider which a sub-committee had been appointed. Reporting on the matter, the chairman said there was a strong feeling among many members, also outside the committee, that they should not have a garage from any person in the trade gratis, as members would feel under an obligation to that member. The committee had visited several sites, and they most favoured the acceptance of the tender of one motorist to provide garage, with electric lighting and heating when necessary, and a man to look after it, at £45 per annum, the lease to be for five years. The sub-committee's recommendation was duly proposed for adoption, but eventually an amendment proposed by Mr. Mell, that the matter should be deferred for a year, was carried by a small majority. Elsewhere the matter has been broached, but, outside London, little has been done to establish such garages.

### Railway Level Crossings.

THE Motor Union has resolved to take decided action to prevent the construction, so far as possible, of any more railway level crossings upon main roads. The manner in which some of our principal roads have been spoiled by railway level crossings is a scandal of considerable magnitude. To cite one illustration out of many—the main road from London to Southampton, *via* Basingstoke, is crossed at two points in Surrey by railway level crossings. The first is at Sunningdale and the second at Camberley and York Town Station. In both these cases not only have these permanent obstructions to traffic been badly laid across the main road, but the width of the road has been reduced in both cases, for the railway companies have built part of their stations and signal cabins on part of the highway. Further, in both cases, and particularly in the case of Camberley and York Town, the stations, which adjoin the level crossings, are of insufficient length, so that trains are brought to a stand partly on the highway, which causes considerable delay to traffic while a train is in the station. All travellers on the Great North Road will know how the main road traffic through Nottinghamshire is obstructed by the railway level crossings on the Great Northern main line, while further north the level crossing at Doncaster should have been abolished long ago. The Union are considering what powers exist in order to have these level crossings removed, and tunnels or bridges substituted. In

the meantime they are examining all Parliamentary Bills in order to see that powers are not given to build any more level crossings.

### Road Trains.

THE idea of developing the prosperity of the countryside by the employment of a train running on the ordinary road without the use of metal tracks, has formed the subject of several inventions since the possibilities of the automobile became apparent. Rather more than a decade ago M. Scotte, who ten years before had invented a steam car, constructed a goods train for common roads, consisting of a motor-car and trailing carriage, which was put into service at Cherbourg. In 1896 the Liquid Fuel Company constructed at their works at East Cowes, Isle of Wight, a road train for a passenger service between Cirencester and Fairford. The motor-van, which carried 2½ tons of goods or parcels, towed an omnibus seating twenty-six passengers, the total length of the train being 33 ft. Circumstances combined to prevent the full development of the idea until the ingenuity of Colonel Renard was displayed in a railless train shown at the Paris Salon in 1903. This was a distinct advance on its French and English prototypes, for, instead of the wheels of the second and other vehicles trailing

linked system, the first car distributing the motive power generated on it through a universal shaft and gearing to each vehicle in the train. It may therefore be said that each car propels itself, and the friction of all the wheels upon the road is claimed to be utilised instead of being a useless resistance which the wheels must overcome. The steering gear of each car being controlled from the leading vehicle enables the train to negotiate practically any curve—evidence of which was supplied in the way it was manoeuvred about the garage.

### The Future.

WE understand that the Daimler Co. will take up the construction of the road train in this country, and at the demonstration Mr. E. Manville spoke hopefully of its prospects. He predicted it would oust the traction engine. It was really a mechanical reproduction of the multiple unit system which had proved so successful in electric traction, and it would, probably, have similar success. Later, Mr. Harry S. Foster, Consul-General for Persia, mentioned that the French Government regarded the Renard road train as of such extreme value that they had voted subsidies for its introduction into rural districts. The initial expenses, the cost of acquiring land and laying tracks, had stood in the way of a larger

The Renard Road Train.

over the roadway, each car, as it were, propelled itself. As we then said (in the *M.C.J.*, December 26th, 1903), the development of the system would be watched with interest; and now, after a lapse of three years, the Renard train comes to England with the added experience of the inventor and a reputation gained in practical service since July, 1905, when the first Renard goods train began to work in France.

### The Renard Principle.

DURING this week a series of trials with the Renard road train have been undertaken by the military authorities, prior to which was an inspection of the invention in the "Arrow" motor-bus garage at Walham Green. There we have had opportunity of observing its ease of direction and the ready way with which each component car of the train answered the steering. The train was composed as follows:—

	Tons.	cwt.	lb.
Locomotor with a 70-h.p. motor	3	2	0
First class carriage	2	14	0
Second class carriage	2	13	0
Luggage van	2	7	28

Each of the carriages and vans is connected up to and propelled by the motor on the leading car, the steering gear being devised on the same principle. That is to say, the train is not drawn in the wake of the locomotor, but this commands the steering gear provided on each car. Thus the train forms a completely

adoption of the Light Railways Act; but the establishment of such a service in this country, which could be removed, practically without cost, from one route to another, would open up agricultural districts and supply the needs that the Light Railways Act was intended to supply.

### A Motor Tour in Scotland.

ON another page we publish an article by a Presbyterian clergyman well known in Ireland—the Rev. Joseph Corkey, of Armagh, who is a practical motorist as well as a minister. He has had some interesting holiday trips in Scotland, and that of which he furnishes an account for our columns covered some of the interesting highways traversed in the course of the last Scottish Reliability Trial; hence he is acquainted with some roads that must have tried his skill and tested his car. His article is also interesting as controverting the assertion so frequently made that motorists tour for speed, and speed alone. The comfortable and leisurely fashion in which the Rev. James Corkey took his motor-car holiday proves once again that motorists do enjoy the scenery of their country, regarding the car as a means of added rational enjoyment, and not merely an accessory to the murder of their fellows.

SNOW is lying all over Westmorland, and two Birmingham motorists were embedded in a snow-drift on Shap Fell on Monday night.

## SOME EXPERIMENTS WITH LOW AND HIGH TENSION MAGNETO-IGNITION.

SOME interesting experiments on low and high tension ignition, spark point position, effect on ignition of change in compression, &c., are described by M. P. Bourdon in a recent issue of "La France Automobile." The tests were all made on a Hotchkiss four-cylinder motor of 112 mm. bore by 120 mm. stroke. Trials were made with the sparking plugs over the exhaust valves, over the inlet valves and in the centre of the cylinder heads. It was found that with the plugs in the last mentioned position the advance necessary for a given output was less than with the plugs in the other positions. However, in order to secure the greatest possible certainty of ignition, the plugs are actually placed over the inlet valves. Over the exhaust valves they become overheated.

The following experiment was made to demonstrate that the advance required by the ignition depends upon the strength of the source of primary current. With a two cell, four-volt accumulator it required an advance of 35 mm. to cause the motor to develop 29-h.p. With a three-cell six-volt battery an advance of only 30 mm. gave the same power. This reduction in the advance required with increased voltage is due to two causes. After the circuit is closed at the contact maker the magnetic

core of the induction coil becomes magnetised and attracts the trembler spring, thereby separating the contact points and producing the spark. Setting the spring in motion requires time, and this time is reduced by increasing the strength of the current, which is done by adding one more cell. Besides this, a hotter spark is naturally produced with six volts, which insures more rapid inflammation.

A series of comparative tests on the same motor were also made with a Simms-Bosch low tension and an Eisemann high tension magneto. The same carburettor was used with both magnetos, but was adjusted specially in each case to give maximum power. Tests were also made with different compressions and different angular positions of the cams. The carburettor was first adjusted for the make and break ignition, then the low tension Simms-Bosch magneto was replaced by an Eisemann high tension magneto of the 1905 model, without means for advancing the armature. Brake tests were then made while causing the primary circuit to open, at 9, 14, 16, 18, 20 and 25 mm. respectively in advance of the piston dead centre. In each case the opening of the primary circuit was made to coincide with the moment of maximum flux through the armature, in order to insure the best possible utilisation of the current. In this way it was found that the best angular relation of the magneto to the motor, the normal speed of which was 1,250 revolutions per minute, was between 14 and 16 mm. (.560—.640 inch) ahead of the end of the stroke. For the make and break device the best

advance has been found to be 1.2 inch. That a greater advance is necessary for the make and break is due to the fact that the action of this device depends upon a spring, and in consequence, although the spring is set to produce the break at 30 mm. ahead of the stroke when the engine is turned over slowly by hand, at a speed of 1,200 revolutions per minute, the rupture actually occurs later, at only 15 mm. advance.

With the Eisemann high tension magneto, on the other hand, the spark occurs at the moment the primary circuit is broken and does not depend on the action of a spring. That the actual advance of the spark with the make-and-break system in the above case is only 15 mm. is shown by diagrams taken on the motor. The curves have the same general form, which proves that ignition takes place under the same conditions. In the first series of tests the power obtained with the high tension magneto was 8 per cent. less than was obtained with make-and-break ignition, at the same motor speed. This result is in full accord with the relative speeds on the road obtained with the two systems of ignition and the same carburettor. Next a carburettor was specially adjusted for the Eisemann magneto, and the same power was obtained as with low tension ignition, after the size of the hole through the spray nozzle had been increased from 1.1 to 1.2 mm. This resulted in an increase in fuel consumption of 15 grammes per horse-power hour. As a carburettor adjusted on a motor running on make-and-break ignition, giving 27-h.p. with relatively low fuel consumption, gave absolutely no power (on the same motor), and with ignition by the Eisemann high-tension magneto, a series of tests were made to determine the variation of fuel consumption with power developed for each of the systems of ignition. From the results of these tests curves were plotted—which are reproduced herewith—which showed that for equal power more petrol is consumed with high-tension than with low-tension ignition. If a carburettor is adjusted for minimum fuel consumption with make-and-break ignition, and the motor develops 27-h.p., it will develop only 24-h.p. if high-tension ignition is substituted while the same carburettor is retained. Under certain conditions, however (in this particular case when the fuel consumption is between 328 and 330 grammes per horse-power per hour), the horse-power and consumption are the same for both systems of ignition.

The last series of tests made had reference to the relative efficiency of the two systems of ignition at various compressions. The compression was varied step by step from 50 to 64 pounds per square inch, and for each step the timing of the motor was varied. It was found that any change in the timing of the inlet valve had the same effect with both systems of ignition. The timing of the inlet was therefore kept constant and the exhaust varied. From the results thus obtained a series of curves were drawn showing the efficiency of each system in each case. For low compression the make and break system was found to be superior and to allow of a relatively large advance. If the compression is increased the high tension system of ignition becomes superior, but only at speeds above 1,000 revolutions per minute. Finally it is to be observed that between 950 and 1,000 revolutions the two ignition systems are substantially equal for all compressions and all manners of timing. A poor charge is more sensitive to an advance of the ignition than a rich charge. When the mixture is slightly poor in petrol, advancing the ignition increases the power of the motor, while if it is a little too rich advancing the ignition has little effect on the power, but causes the motor to knock.

SIR BERKELEY SHEFFIELD has recently placed an order with the Daimler Company for another 28-h.p. car.

LICENCES and badges will be issued after March 31st next by the Commissioners of Works and Public Buildings for the admission of electric carriages to Hyde Park between the hours of 4.0 p.m. and 7.0 p.m. in the months of May, June, and July. Forms of application may be obtained, by letter only, from The Secretary, His Majesty's Office of Works, &c., Storey's Gate, Westminster, S.W.

## A MOTOR TOUR IN SCOTLAND.

BY THE REV. JOSEPH CORKEY.

ONE day last autumn my wife and I boarded our two-seated Beeston Humber car, and set out to enjoy a motor tour in "Bonnie Scotland." We crossed the Channel by the Larne and Stranraer route, and from the latter place steered eastwards through the rich country around Glenluce and Newtonstewart. Beyond Newtonstewart we took the New Galloway road for Dumfries. On this bare moorland highway we encountered a fearful thunderstorm. Rain had been falling most of the day, but now the grey sky changed to inky blackness, and the storm broke in all its fury. There was neither tree, house, nor shelter of any kind to be seen; nothing but moor, mountain and river. New Galloway was six or eight miles distant. The lightning flashed, the thunder rolled and echoed through the hills, and the rain fell in torrents. Putting the engine to its best, we wished along roads that were fast becoming rivers. The water formed into cascades on either side of the car, and sometimes enveloped us in a cloud of spray. Getting into deeper water, the engine began to misfire. There were a few fitful explosions and then silence. The car continued to travel with the momentum gathered, and I kept the gears engaged. It was a moment of intense suspense. But just as the car was on the point of coming to a stand-still the engine started up again with that steady pulsation which seems to say, "All's well," and excelled itself in the next six miles into New Galloway. Here we arrived in a drenched condition, and were glad of hotel comforts. The storm raged till midnight, and next day the papers told of great destruction to life and property by lightning and floods.

Next morning was bright, so we were soon climbing the long ascent on the road to Dumfries. The same afternoon we reached Moffat, a favourite health resort among the hills of Upper Annandale. Here we spent a happy evening, and put up for the night. Early next day we were off again, climbing the eleven miles to the top of the Selkirk hills. Our little engine carried us right up without any labouring, and we gave it a well-earned rest as we coasted down the other side. The scenery at this point baffles description. The winding road is shut in on either side by lofty hills. Down their steep sides cataracts were falling like streaks of feathery foam. Before us was marshalled a range of hills guarding the pass through which we were travelling. One hill rose beyond another, each wearing its own particular shade of dress, and each growing more and more dim, until the furthest summit was faintly outlined in the softest of nature's mountain shades. Then St. Mary's Loch, in all its beauty, came into view. We skirted its shores and entered the valley of Yarrow. The roads were excellent and the weather ideal for motoring. We hastened on through Selkirk, past Abbotsford, and into Melrose. Having been over the Scott country before, we did not linger long amid its many attractions. On we sped along the Border. We enjoyed the valley of the Tweed in the neighbourhood of Kelso. Crossing the Border at Coldstream we had a fine run into Berwick-on-Tweed. At Eyemouth, a little seaside town seven miles north of Berwick, we spent two weeks, strengthening our lungs with the pure air off the North Sea.

Leaving Eyemouth, we took the great main East Coast road for the North. It was the beginning of the grouse season, and we were sometimes well nigh smothered with grit, dust, and

smoke, as some reckless driver snorted past us at forty or fifty miles per hour. I am glad to say this style of driver was the exception, not the rule. After a few days in Edinburgh we crossed the Forth at Granton, and, passing through Kinross and lovely Glenfarg, we skirted Perth and went on to Blairgowrie. Here among the hills we sojourned for some days. The district was literally alive with motors, and the sound of the hooter was as common-place as a sparrow's chirrup.

One of the most delightful runs we had from Blairgowrie was a circular tour through the lovely hill district to the north-west of the town. The first ten miles took us past a series of lochs, whose waters, like sheets of polished glass, mirrored the wooded hills along their shores. Away up on the steep slopes the Scotch firs seemed to be clinging to the bare rocks. Near Dunkeld we descended a very long and nasty hill and dropped into the charming valley of the Tay. As we glided along the shady road, we had mile after mile of ever-changing scenes of beauty, for Nature laid before us countless combinations of river, wood, and mountain. After twelve miles of this we reached Pitlochry and turned east for the mountain pass to Kirkmichael. We were told our little car would never get to the top, but we reached it without a stop, after a stiff, steady climb of three miles. The view as we ascended was magnificent.

Far down in the valley we could see Pitlochry in its setting of mountain and wood, and the river appearing here and there among the trees like a band of silver on the landscape. After a rest on the heather-clad hills we made our way to Blairgowrie again, via Kirkmichael and the valleys of the Ardlie and the Erich, having made a fine tour of fifty miles.

Since our thunderstorm experience we had been favoured with good weather, and this continued until we reached Armagh again. We came south through Stirling, Bridge of Allan, Dunblane, and over the coal fields of Denny and Cumbernauld. A day at Coatbridge and we were off again through the smoke and traffic of Glasgow, on past Kilmarnock, Ayr, and Maybole, until

we espied Ailsa Craig and struck the coast road to Stranraer. We reached the port before dark, embarked for Ireland, and reached home next day.

We had motored 724 miles without a puncture, and without a mechanical break down or trouble of any kind. Only once did a loose screw put the ignition out of order for a few minutes. I have proved by two such tours as that I have just outlined that a man need not be debarred from the pleasures of motor touring because he cannot afford a big touring car. There is real, genuine pleasure in this mode of holidaying, and, if you can avoid high-class hotels, not much expense. Petrol, oils, grease, and ignition for the tour cost me no more than 31s. 6d. Scotch roads are good, fellow-motorists most obliging, and the police not over-officious.

THE enthusiastic motorist who purposes making an early start this season should now set to work without delay to put his car in trim for the road. A spell of fine mild weather with firm dry roads may be expected at any moment, and nothing is more exasperating than to find, under such circumstances, that the day must be spent in putting in order a car which might have been attended to weeks before. Now is the time, too, to introduce any improvements required, such as steering wheel control—the Bowden controls being specially adapted for bringing an old car abreast of the times in this respect.

The Author on his Humber Car.

## THE SPIVEY FRICTION-DRIVEN CAR.

A SOMEWHAT novel form of friction-driven car is about to be put on the market by the Spivey Motor Company, of Heckmondwike, Yorkshire. A general view of a light chassis fitted with the new gear, which gives three speeds and reverse, is given in Fig. 1, while a diagram of the arrangement is shown in Fig. 2. From the latter it will be seen that the gearing consists of a three-stepped cone pulley B, which forms the

Fig. 1.—Diagram of Spivey Friction Drive.

flywheel of the motor. The driving faces of the pulley are leather covered and running in contact therewith is a large hollow drum C lined on its inner face with leather, with a rubber band behind. The drum is so arranged that it can, in conjunction with a telescopic cardan shaft E, which conveys the power to the rear axle, be advanced or drawn to the rear, and at the same time raised or lowered into contact with the pulley giving the desired speed. The movement of the cone is controlled in a simple manner by a hand wheel on the steering column, and the car is stopped and started in the usual way by means of a foot lever. The reverse is obtained by means of a separate pulley F which can be brought into contact both with the flywheel and the friction drum. Mr. F. Spivey informs us that the drive is the result of

Fig. 2.—Chassis of Light Car fitted with the Spivey Friction Drive.

long experiments and trials, and that a company is being formed to manufacture light vans for trade purposes in which the gear will be employed. Among the advantages claimed for it are that there are no gears liable to damage in changing speeds. No undue strains are placed on the crank shaft of the motor. The driving faces of the cone pulley run within the hollow drum, affording a large area of friction surface, which is further increased by the rubber band "giving" slightly, the result of which is a drive approximating that of a belt.

## CONTINENTAL NOTES.

### The Grand Prix Race.

After much deliberation the Committee of the French Automobile Club has selected the Seine Inferieure circuit for the forthcoming races for the A.C.F. Grand Prix and the Coupe de la Commission Sportive. As will be seen from the accompanying map, the course, which measures 81 kilometres, or 50 miles, takes roughly the form of a triangle. From Dieppe, which is the chief town passed through, the road leads to the village of Envermeu (12 kilometres), thence to Londinières (12 kilometres), Eu (28 kilometres), Criel-sur-Mer, and back to Dieppe. On the whole the roads are good and fairly wide, and the local authorities have undertaken to put them in good repair before the date of the contests. It is expected that the starting point, where the grand stand will be erected, will be at Le Pollet, quite close to Dieppe. The entry list for the contest for the Coupe de la Commission Sportive closed last week end, and some disappointment is expressed at the fewness of cars which have been entered. They number only nine, viz., a Gillet-Forest, two Darracqs, three La Buire, a Porthos, and two H.I.S.A. For the Grand Prix race, on the other hand, as has already been

Map of the Seine Inferieure Course on which the race for the A.C.F. Grand Prix is to be held.

mentioned in the *M.C.J.*, there are thirty-four competitors. The dates of the races have been fixed for July 2nd and 3rd, but it has not yet been decided whether the Grand Prix will be run off on the first or second day of the meeting. It is even suggested that the two events, owing to the paucity of entries for the Coupe race, may be run concurrently.

### The Targa Florio Race.

Preparations are well in hand in Palermo, Sicily, for the annual Targa Florio race, which is this year to be held on April 21st. The contest is open for cars having (1) engines of a bore of from 120 mm. to 130 mm. in the case of four-cylinder motors, and from 85 mm. to 90 mm. for six-cylinders. The weight of the car is to be in proportion to the cylinder bore, on the basis of 1,000 kilogs. for 120 mm., plus 20 kilogs. for each additional millimetre of bore in the case of the first category, and in the second class 1,000 kilogs. for 85 mm. bore, with 40 kilogs. more per millimetre bore in excess. The race will be held on a circuit, which takes in Cerda, Cultavultura, Petralia, and Castelbuono, a distance of 150 kilometres, this having to be covered three times, the total distance being 450 kilometres. So far twenty-five entries have been received for the event, these

comprising two Lucia, four Fiat, two De Dietrich, four Itala, three Benz, two Darracq, a Bayard-Clement, three Isotta-Fraschini, and three De Luca-Daimler. In addition to the Targa the winner will carry off a money prize of £600, the second man will take £320, the third £160, the fourth £80, and the fifth £40.

#### Motoring Events in Belgium.

A revision has been made by the Belgian Automobile Club in the dates on which this year's Circuit des Ardennes and Coupe de Liedekerke contests are to be held; as now fixed, the former will take place on July 22nd and the latter on July 23rd.

#### A French Hill-climbing Contest.

Under the auspices of the Automobile Club du Rhone the "Lyon-Sport" is organising a hill-climbing competition from Cheres to Limonest, a distance of 4 kilometres, for April 21st next. Categories will be provided for racers, touring cars, and

1905, has now over a hundred members, Prince Bibescu being the president. With the view of encouraging the movement, the club has appointed official delegates throughout the country, whose duty it is to inform tourists of the best roads, petrol depots, hotels, &c.

#### Public Services in Spain.

A company has recently been formed in Toledo, with the title of La Sociedad Automoviles de Toledara, to run a public service of motor vehicles in the district. Four 24-h.p. Brillie vehicles, having accommodation for twenty passengers, have been ordered by the new concern.

#### Public Services in Germany.

A public motor-car service is about to be started between Eutin and Lensahn. It is intended to at first employ two 15-seated Daimler vehicles. Arrangements are also in hand for the establishment of a service between Berchtesgaden and

A View on the Seine Inferieure Circuit on which the race for the Grand Prix de l'A.C.F. is to be run. As will be seen from the photograph reproduced above, workmen are already engaged in repairing the roads.

industrial vehicles, and, in addition to a classification by time, an efficiency test will also be carried out.

#### A Hotchkiss Six-Cylinder Car on Tour.

As we briefly recorded in our last issue, one of the latest Hotchkiss six-cylinder cars is at present being submitted to a very exhaustive road trial—a 10,000 kilometre tour of France. Considerable interest is being shown in the undertaking, as it is the first French six-cylinder vehicle to undergo such a long trial. The first part of the journey was to Marseilles, Cannes, Nice, and Monte Carlo, and as we go to press we learn that M. van Marcke, who is driving the car, had safely reached the Riviera.

#### Motoring in Roumania.

That automobilism is making steady progress in Roumania is shown by the fact that no less than 350 cars have been imported into the country during the past three years. The Automobile Club of Roumania, which was formed in December,

Königssee for the transport of passengers and the mails. The Allgemeine Berliner Omnibus Gesellschaft, of Berlin, has just placed an order for twenty-four Bussing motor-buses.

#### Miscellaneous Items.

A public motor-car service is shortly to be started between Moutiers and Bourg-Sainte-Maurice, Savoy.—A motor volunteer corps is being formed in Spain. The Royal Automobile Club of Spain is interested in the movement.—The "Auto," of Paris, is organising a subscription for the purpose of erecting a monument to the memory of the late M. Leon Serpollet.—A motor-car exhibition was opened in Amsterdam on the 15th inst. Among the British-cars on view are the Humber, Stuart, and Starling.—The fourth annual motor-car exhibition in Turin, which will continue until March 3rd, was opened on the 16th inst.—The Technical Committee of the A.C.F. is considering the question of organising a trial of two-cycle motors for use on automobiles.

## SOME CURRENT TOPICS.

### Non-freezing Engine-cooling Solutions.

It is not only in this country that interest is being taken in the question of non-freezing engine-cooling solutions, and in connection with the correspondence on the subject which is at present taking place in our columns a reference to the experiments of a French motorist may be of service. Writing to *L'Omnia*, he states that he has for some years made a practice of using, in very cold weather, a solution consisting of 50 per cent. water and 50 per cent. *molasse de sucrerie*, or sugarhouse molasses—a dark brown, viscid, uncrystallisable syrup, which drains from sugar in the process of manufacture. The residue contains from 40 to 60 per cent. saccharose, a large proportion of potash and of various mineral salts; its specific weight is about 1.450, and it shows on the Baume densimeter at ordinary temperatures from 40° deg. to 45° deg. M. Willemart-Delhayé,

than the wooden wheel, or, put in another way, a wire wheel for a given car can be made lighter than a wooden one. He shows that for a 35 in. pneumatic tyre the wood wheel weighs 39 lb., whereas a wire one only weighs 28 lb., and even then is considerably stronger. Furthermore, the wire pattern is unaffected by climate, repairs can be rapidly effected and broken spokes quickly replaced. Not only so, but all the material used in a wire wheel can be made equally good, whereas with a wooden one it frequently varies considerably. The only disadvantages that Mr. Edge can see in regard to the wire wheel is that at present the motoring public consider it does not look so nice, and, secondly, that it is a little more difficult to keep clean and smart looking. No doubt many of our readers have their own views on the respective merits of the two types of wheels, and we shall be glad to give publicity to any communications on the subject they may care to send us.

### The Diameter of Inlet Pipes.

In our Correspondence columns last week one of our readers raised the interesting question as to the correct diameters

M. Van Marcke at the wheel of the Hotchkiss Six-cylinder Car which is at present making a 10,000 kilometre tour of France.

the motorist in question, states that the solution is quite uncorrosive, and that, owing to the potash present, it has a detartarising effect on the cylinder jackets and water-circulating pipes, rendering its use advantageous in more ways than one. He adds that the molasses can be obtained very cheaply, and that they can be safely kept in a cask. It would be interesting to learn if any English motorist has carried out experiments with the same by-product.

### Wire or Wooden Wheels.

Much has been written in the past anent the respective merits of wire or wooden wheels for motor cars, but, although the former have been shown to possess many advantages, the tendency during the past few years has been mainly towards the heavier artillery type. With a view of ascertaining whether this, as he believes, is mainly due to questions of appearance, Mr. S. F. Edge has just issued a letter to motorists asking for an expression of opinion on the subject. In the communication in question, Mr. Edge advances many reasons in favour of a larger use of the wire or suspension type of wheel. For instance, he points out that, weight for weight, it is considerably stronger

of the inlet pipes that should be used for petrol engines of different powers. The point is one which we do not remember having seen raised before, and we have, consequently, made some enquiries regarding it. There are so many variable factors which have all to be considered in fixing the diameter that no hard and fast scale can be given, although for a rough approximation one-third the cylinder bore may be taken as a suitable size for the diameter of the requisite inlet pipe. Messrs. Longue-mare, of Paris, are the only firm which has to our knowledge published any information on the point, and we give below a table showing the sizes of inlet pipes they not only recommend, but provide for in connection with their well-known carburettors:—

For Engines.	No. of Cylinders.	Dia. of Inlet Pipe. mm.	For Engines.	No. of Cylinders.	Dia. of Inlet Pipe. mm.
1-h.p. to 2½-h.p. ...	1	19	8-h.p. ...	1	30
2½-h.p. to 3½-h.p. ...	1	22	12-h.p. ...	2	34
5-h.p. to 6-h.p. ...	2	24	12-h.p. to 16-h.p. ...	4	41
4-h.p. to 5-h.p. ...	1	24	12-h.p. ...	2	48
6-h.p. to 8-h.p. ...	2	26	16-h.p. to 20-h.p. ...	4	56
6-h.p. ...	1		20-h.p. to 30-h.p. ...	4	
10-h.p. ...	2		30-h.p. to 45-h.p. ...	4	
12-h.p. ...	4		45-h.p. to 60-h.p. ...	4	

H.M. KING EDWARD VII. has been graciously pleased to accept a copy of Mr. Charles Jarrott's book on "Ten Years of Motors and Motor Racing."

MESSRS. ALFRED KEAR AND Co. are preparing a welcome for the Siddeley car, now on its long trial, when it reaches their new central garage and motor works in the Commercial Street, Hereford.

MR. R. L. JEFFERSON, who, it will be remembered, started on a motor tour through India in November last on an 8-h.p. Rover car, has now reached Madras. He is at present exploring the districts round Bangalore, Mysore, Ootacamund and Trichinopoly.

It was reported at Tuesday's meeting of the Surrey County Council that during last year the receipts from the registration of motor-cars and cycles and the issuing of drivers' licences totalled £1,574 10s. The number of cars registered was 381, and 4,089 drivers' licences were issued.

MR. HERBERT SAMUEL, M.P., Parliamentary Secretary at the Home Office, has met two deputations from cab-owners and cab-drivers with reference to the proposed order regarding motor-cabs in the Metropolis. On the question of wages he said the only duty of his department was to see that the fares were such that a reasonable wage could be paid.

THE speed of motor-cars between Chesterfield and Hasland was the subject of a long discussion at the meeting of the Chesterfield Town Council last week, when the Chairman of the Watch Committee declared that the law was not transgressed, and, so far as the drivers of the public service vehicles were concerned, they did not drive furiously.

A NEW motor garage has been erected in Law's Yard, London Road, Thornton Heath, for Messrs. S. de Saumarez Brock and Co. Its dimensions are 45 ft. by 35 ft., and the opening for business has been celebrated by a supper attended by many of the firm's customers and friends. Here repairs will be undertaken and all classes of motor accessories will be stocked.

THERE are now twenty entries for the International Tourist Trophy Race and five for the International Heavy Touring Car Race. Several Continental firms have written asking for information, from which it may be gathered that energetic foreign rivals are alive to the fact that the British manufacturer is becoming a more potent factor in the situation with each succeeding year.

AMONG enthusiastic lady motorists is the Baroness de Reuter. Since July last she has driven a 12-14-h.p. Argyll nearly 4,000 miles without trouble of any kind. She is able to drive thirty miles to the gallon of spirit in ordinary country driving. This Argyll, which the Baroness has driven with such satisfaction, was the same vehicle that ran in the 1905 Tourist Trophy race.

THE "A.C. system of handicapping for hill-climbing competitions" has now been circulated to the affiliated clubs and to others interested in the evolution of scientific formulæ in connection with the question of handicapping. The Technical Department is busy preparing charts of the various hills throughout the country, to be used in connection with this booklet, which has just been published by the A.C.G.B.I.

MR. H. M. NAPIER is using naphtha as a motor fuel, this being distilled in the production of paraffin from shale found in the neighbourhood of Bathgate, N.B. Its specific gravity is .720 to .750, but when over .730 a few drops of petrol have to be injected into the inlet pipe to start the motor. It can be bought in forty gallon barrels at 4½d. per gallon; but the high cost of carriage would be against its use in England.

THE regulations for the Commercial Vehicle Trials are now receiving the consideration of a joint committee composed of representatives of the A.C.G.B.I., the Society of Motor Manufacturers and Traders, and the Motor Van, Wagon and Omnibus Users' Association. It is proposed that the trials should begin in September next and continue for about a month, touching at all the chief commercial centres of England and perhaps reaching Scotland.

## HERE AND THERE.

THE Crystal Palace Automobile Club has nearly completed arrangements for a series of trials for small motor-cars.

MESSRS. L. RUSSELL AND Co., of 7, Station Road, Bexhill-on-Sea, are hiring motor-cars to

visitors, and have every facility for the repair of vehicles which meet with breakdowns in their district.

ACCORDING to the Chief Constable of East Sussex, "fines amounting to £784 were paid by 124 motorists for exceeding the speed-limit in his district during four calendar months of last year."

At a conference of delegates from Poor Law authorities on existing ambulance services, held in London, the President of the Metropolitan Street Ambulance Association said that there are only four rapid transit ambulances in London, three belonging to the Metropolitan police, and the new automobile ambulance of the City of London.

DEMONSTRATING the absence of vibration in modern petrol engines is becoming quite the order of the day. The latest to fall into line is the Clement Talbot Company, Mr. T. H. Woollen having sent us a photograph, reproduced herewith, of a test he made last week in connection with one of their London-made 20-24-h.p. four-cylinder Talbot cars. The glasses were filled to

the brim with water. Previous to starting up the engine the starting handle was removed, and a speed indicator attached in its place. The photographic plate was exposed five minutes, the speed of the engine during the test being between 1,000 and 1,100 revolutions per minute. The clearness of the photo, in addition to the position of the water in the glasses, is an excellent testimony to the small amount of vibration set up.

A STAFF tour under the directorship of Major-General W. E. Franklyn, C.B., commanding 4th Division, took place recently, the operations being carried out over the country between Frome and Yeovil. The following officers of the Army Reserve Corps were employed on duty:—Captains O. H. Bayldon, H. Welch-Thornton, H. M. McAllister, and Lieutenants J. Peto Shrubbs and H. G. Nalder.

By the courtesy of the architects, Messrs. Harrison and Hattrell, we have had an opportunity of inspecting the site—twenty-eight acres—of the Humber Company's new works at Coventry. The factory will be of the single storey type, and so designed that the work of constructing cars will be progressively carried on in such a way that the raw material will be taken in at one end and completed vehicles turned out at the other. We understand that a portion of the new works will be ready for occupation in about three months.

SIR HUME GORDON, BART., has placed an order with the Daimler Co. for a 28-h.p. 9½ ft. wheelbase chassis.

THE Corporation of Leeds has decided to purchase two new motor-cars for the service of its Tramway Committee.

THE Earl of Ellesmere is introducing motor-cars to take the place of horses for the use of certain of his pay-clerks and other officials connected with his colliery and other undertakings in the Manchester and Bolton districts.

THE accompanying illustration affords demonstration of the reliability of the "Fastnut," that has met with so much favour

from motor-car makers since its introduction a few years ago. This shows a bolt taken from a stone crusher. It will be seen that the constant friction of the stones has worn away half the nut and washer, but without moving them in the least degree. The Fastnut is now being used by many Government departments as well as by leading engineering firms. It is put upon the market by Messrs. Fastnut, Ltd., 60, Aldermanbury, London, E.C.

ON Thursday, Col. Dobson, J.P., opened a display of motor-cars organised in the Drill Hall, Burslem, by

Mr. H. K. Hales, of Market Place, Burslem. This will be continued till the 2nd prox., and among the vehicles on view will be examples of the Napier, Daimler, Argyll, Humber, Brown, Lancaster, Clement-Talbot and other well-known cars.

MATLOCK BATH has now its motor garage, this being provided by Messrs. E. Williams and Co., who have equipped the premises with all that is necessary for the convenience of motorists temporarily delayed or residing in that pleasant town. In addition to facilities for repairs, Messrs. Williams and Co. have a large stock of accessories, &c.

AN application is being made by the Portsdown and Horn-dean Light Railway to the Light Railway Commissioners for powers to extend the railway through the village of Horndean. The latter is on the main London-Guildford-Portsmouth road, and the Motor Union is taking steps to ensure that the safety of the public and the convenience of traffic will not be further interfered with.

THE Wolseley Tool and Motor Car Company, Ltd., have completed arrangements with the Automobile Club to send a 40-h.p. Siddeley car on a long distance reliability trial. It commenced last week from the Club's garage in Down Street, W., and will be run throughout Great Britain, making tours from various important centres, over roads which are well known for their severity. Among the places to be visited are Plymouth, Bristol, Birmingham, Liverpool, Glasgow, Dundee, Edinburgh, Newcastle, Leeds, Lincoln, Norwich, and Cambridge.

CONSIDERABLE development is taking place in the motor auction business, and the coming season will undoubtedly be an advantageous one all round. The first automobile auctioneers in this country were Messrs. Friwell's, of Albany Street, Regent's Park, N.W., and they announce that in future they intend to only charge a commission of 5 per cent. for selling cars. Should no sale result, no charge will be made. The additions to Messrs. Friwell's premises provide for the storage of over 800 cars, and the trade are sending selections of vehicles to this auction mart.

MESSRS. SNOWDON, SONS AND CO., LTD., Millwall, London, E., have sent us a copy of the latest price list of their motor oils and greases. The firm have devoted special attention to the production of high-class lubricants for air and water-cooled petrol engines and are manufacturing half a dozen different grades, each adapted for a certain class of motor. The oils are claimed to perform their functions without any tendency to gum or carbonise when exposed to excessive heat, while extreme care is taken in keeping the quality uniform, a point to which no doubt their growing popularity in motoring circles may be attributed. Messrs. Snowdon also make two qualities of gear-box lubricant—light and dark—as well as the "Snowdene" motor grease.

NEW members of the A.C.G.B.I. include the Earl of Crewe, Lord Hylton, and Mr. G. Courthope, M.P.

—LADY STANLEY has just acquired a 20-30-h.p. landaulet from the Maudslay Motor Company, Ltd., Coventry.

FROM Mr. S. F. Edge comes a photograph of a shipment of six 6-cylinder Napier cars and one smaller one to a Colonial agent, another small sign of the fact that British manufacturers are steadily establishing an export trade.

MESSRS. MANN, EGERTON AND CO., LTD., of the Prince of Wales Road, Norwich, have sent their new catalogue for 1907, in which they give some particulars showing the increase of the automobile business in that part of East Anglia. In 1902 they sold fifteen motor-cars; last year more than 200 were disposed of, while their large garage, with its well-equipped repair shops, was kept busy throughout the twelve months. The firm hold several important agencies, and their list indicates the enterprise with which they have looked after the interests of their clients in Norfolk.

WHEN going through the works of the Singer Company in Coventry the other day we noticed a couple of special three-wheel vehicles in course of completion. Inquiries revealed the fact that they were being specially built to the order of the Egyptian Government for use in Eastern Egypt in connection with the work of the Department of Mines. The machines have a striking appearance, for, while built on the lines of a tri-car, the construction is similar to that of a motor-car, the motive power being supplied by a 12-h.p. two-cylinder V type engine. As regards the standard Singer cars, of which a description was given in a recent issue of the *M.C.J.*, we found a large number in course of manufacture, both of the 7-h.p. two-cylinder and 12-14-h.p. four-cylinder models.

MR. G. H. WAIT, of Leicester, sends his catalogue of "Clyde" motor-cars and cycles for the coming season. Recently we referred to the extensive works and garage possessed by Mr. Wait at Green Lane Road, Leicester; the list now before us sets forth the essential features of some of the leading productions of that establishment. It is claimed for the Clyde car that simplicity, accessibility, ease of control, absence of side-slip, reliability and economical running are points that have been incorporated in the construction of this vehicle, which is made with engines of 8-10-h.p., 12-14-h.p., while the four-cylinder car is fitted with motors of 16-20-h.p., 20-24-h.p. or 20-30-h.p. Motor-cycles are also included in the price list, which will be of considerable interest to motorists on the look-out for automobiles of reasonable price.

ONE interesting feature of the Edinburgh Motor Show is the practical demonstration of the new method of "cord" tyre making at the stand of the Palmer Tyre, Ltd. The company have gone to considerable expense in laying down working plant in order to show the motorist how much better a cord tyre can now be made by the substitution of machinery for hand labour. The cording machine illustrated was designed and constructed at the works, and it is credited with cording a tyre in twenty minutes with absolute regularity and equality of tension, the same operation by hand taking an experienced worker about eight hours. This invention

reduces the cost of manufacture, of course, and accounts for the great reduction in prices of Palmer Cord Tyres this year.

THE exports of motor-cars and parts last year from the United States attained a value of £881,837 as compared with only £539,131 in 1905. The largest shipments were to the United Kingdom, which was responsible for £227,652 of the total, Canada being second on the list with £175,777.

[Letters to the Editor should be addressed to the office, 27-33, Charing Cross Road, W.C.]

### THE SIDESLIP PREVENTION COMPETITION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was a spectator of the trials held by the Automobile Club on the 6th inst., and was more than surprised to find that the conditions imposed by the Club in their printed rules had been departed from to such an extent as to render, in my opinion, the trials somewhat farcical, and, as a competition, absolutely useless.

In Part 2, Preliminary Test, Section 7, the rules of the Club state "the devices must be fitted to a motor-omnibus which will be supplied by the Club," and Section 8 goes on to state "the vehicle or vehicles will be driven by the same driver throughout the test," and "the driver will be supplied by the Club." The departure from Section 7 does not appear to be very serious, but the same cannot be said in connection with the alterations in the conditions of Section 8. It is

repeat the preliminary test, viz., part 2, after the 1,000 miles have been run under ordinary road conditions. It would be interesting to see how far the wear and tear had affected the devices as non-skids.—Yours truly,

FAIR PLAY.

### MOTOR-CYCLING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Arthur Candler's article in your issue of the 9th inst. interests me considerably. My opinion, however, differs rather from both Mr. Jarrott's and Mr. Candler's. Briefly, the former advocates a light, low-powered, easily managed and handy machine, whilst the latter advocates the full-powered touring machine. Is it necessary that we strive to perfect one type of motor-bicycle suitable for all classes of riders, or is it not very much more desirable that we should supply each type of rider with the machine which suits him? Mr. Jarrott voices the opinion of a large number of would-be motor-cyclists; Mr. Candler, the opinion of a large number of genuine touring motor-bicyclists. Assuming I represented the speed merchant, police trap dodger, and racing man, would it be reasonable to ask Mr. Jarrott's men to ride Mr. Candler's men's machine, or my men Mr. Jarrott's men's machine, and vice versa? Then, instead of wasting time groping after an ideal any-rider-machine, let us perfect the light runabout, the go anywhere tourist,

Touring in Cornwall—A View of Fowey.

the contention of the writer and of many of his fellow spectators that had the same driver been employed throughout, quite different results would have been achieved. The officials themselves evidently felt the same about the matter, as they compelled several of the drivers to repeat their performances, their first and second efforts being unsatisfactory. It is surely a question for argument how far the Club are at liberty to alter the conditions of trials without proper notice to competitors, and whether such a serious departure from the rules does not render the whole competition null and void, and point the way to further trials, where the rules laid down shall be strictly adhered to.

There is still another matter of interest in connection with the trials. In the opening sentence of the printed rules issued by the Club, and under the heading "Object," it is stated that the devices must comply with the regulations of the Local Government Board. Now these regulations are most emphatic, and clearly state that motor vehicles of the 'bus type shall have their wheels fitted with a "soft or elastic material." It would be interesting to know whether, for the purposes of these trials, the club have obtained any relaxation of this order, otherwise I fail to see why certain metal devices in direct contact with the road were passed for trial. It was the knowledge of this order of the L.G.B. that has kept back a number of devices from entry. If the club have received the sanction of the L.G.B. or of the police for such relaxation of the orders, why was it not publicly stated? The competition could then have been made a genuine trial and not resulted in the farce it has. As a suggestion to the Club in connection with their present efforts to prevent the discovery of a really efficient non-skid I would

and the mile a minute racing machine separately, and I think we should perhaps increase our brotherhood, as Mr. Jarrott suggests, and prevent our existing 40,000 trying to become car owners, as Mr. Candler hints.—Yours truly,

R. K. HUBBARD.

General Hon. Sec.,  
Basingstoke and District Motor Club.

### A NOVEL CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—For four years I have been in "mortal combat" with the chief motor problems of the day, and as only one remains to be "slain," viz., marketing the inventions, a summary of some of the results may interest your readers. These statements are backed up by first-class experts, and, as I have them embodied in a pleasure car and a commercial vehicle, can be borne out. The questions were (1) speed gear; (2) want of flexibility, resulting in multiplication of cylinders; (3) shocks, resulting in strains and wear of mechanisms and tyres, necessitating unnecessary strength and weight; (4) vibration; (5) noise; (6) dust; (7) pit abolishment; (8) simplicity; (9) accessibility; (10) long life; (11) to be fool-proof; (12) freedom from repairs; (13) control; (14) finality.

I have found the key-note to be a flexible transmission. 1. My actual change-speed consists of two parts only, absolutely silent, shockless, and

almost unwearable, changes like an electric switch, imperceptibly, and with drive on, no gear-wheels or other modern weaknesses. 2. A single-cylinder as sweet as a six. 3. No shocks or strains. Proofs: 10,000 miles on unprotected tyres with scarcely a scratch, a fierce clutch can be let in with a bang without harm. 4. 1, 2, and 3 cover this; in addition, my mechanism being cross-ways and running *en bloc* all speeds, the gyroscopic action resulting gives luxurious running and springing. 5. Transmission absolutely the most silent. 6. A straight, smooth run underneath and all mechanism in closed cabinet, serving the double purpose of a frame and dustless in or out. 7. All in sight from above, no pit needed. 8. The chassis is so bald and simple that a novice can grasp it in a few minutes; an irreducible minimum. 9. See Nos. 7 and 8. 10. Impossible to produce a more lasting transmission, change-speed as silent after years of use as when new. 11. Almost impossible to damage the transmission by fooling. 12. Repairs therefore exceptional. 13. In addition to the finger touch change-speed, I have now arranged to use one pedal only for forward free engine or reverse on all speeds, and brake in either direction. Applied instantaneously in any order at will with one foot without damage. 14. Expert opinions are that with slight modifications I have produced a final type. I hope shortly to exhibit the system in London.—Yours truly,

C. H. DENT.

## A RENAULT CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. B. Percival's letter in the last issue of the *M.C.J.* and to your reply to the same, I had a similar case with a 15-h.p. four-cylinder car. I did everything I could think of, but still the popping occurred and there was no compression. I then dismantled the cylinders, but everything seemed in order, so I removed the pistons, carefully adjusted the ring joints and also the valves. Although the inlets and exhausts were perfect, there was still a great loss of compression.

The 40-h.p. six-cylinder Napier Car recently supplied to His Excellency the Viceroy of India. It will be noted that the vehicle has a specially designed body to suit the Indian climate.

sion and a rush of air from the induction pipe. There was no blow past the rings, and the valves, as previously mentioned, were perfect. Here was a puzzle indeed! Eventually the trouble turned out to be due to the holding-down bolts on the seat portion of the inlet valve springing that part sufficiently to cause the inlet valve to sit on two small arcs. I should never have thought it possible, but it resulted in popping, fire at carburettor, and loss of compression.—Yours truly,

HERBERT J. CHAPMAN.

## THE STANDARDISATION OF NUTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a letter in the *M.C.J.* of the 9th inst. which raises the question of standard nuts and screws for automobile construction. You will see, from the circulars I send you separately, that what is adopted by the Clement-Talbot Company has reduced this to extreme simplicity. You will notice, in the matter of pitches, that there are only five pitches of threads in all. I believe our friends, the Beeston Humber Company, have eliminated even the 1.25 pitch and reduced the number to one less. On page 51 of "Shop Notes" (enclosed), it is explained that we use the 60 degree thread as employed in the "Système Internationale," but all the pitches on a well-designed automobile should be between 1½ mm. and 2 mm. pitch. Any coarser thread than that is certainly unnecessary, and cannot be as safe as a finer thread, and of course the finer the thread the less liability to shake loose.

By reference to the appended table giving the standard sizes of nuts and spanners used on the Talbot cars, you will see that although the width across the flats of the nuts is given in civilised units, viz., millimetres, they are exactly equivalent to many of the well-known Whitworth sizes. This was done as there are large stocks of hexagon steel available for the manufacture of screw work. The Whitworth sizes quoted are to be found also on most first-class Continental cars, but many of the makers do not know of this fact! As regards the list of

sizes of screw threads, caps, and tapping drills, you will note a footnote to the effect that for diameters less than 4 mm. British Association threads are used, and, as is well known, these are also metric threads.—Yours truly,

C. R. GARRARD.

CLEMENT-TALBOT, LTD.

STANDARD SIZES OF NUTS AND SPANNERS (1907).

DIAMETER OF BOLT.	WIDTH OF NUT ACROSS FLATS.	WIDTH ACROSS CORNERS (MAX.)	WIDTH OF SPANNER GAPE.	WHITWORTH EQUIVALENT.
4 mm.	6.9 to 7.0	8.05 mm.	7.05 to 7.1	—
5 mm.	8.9 to 9.0	10.5 mm.	9.05 to 9.1	—
6 and 7 mm.	11.3 to 11.4	13.2 mm.	11.5 to 11.55	½"
8 mm.	13.2 to 13.3	15.5 mm.	13.4 to 13.45	¾"
9 mm.	15.1 to 15.2	17.5 mm.	15.3 to 15.35	1"
10 mm.	17.9 to 18.0	20.8 mm.	18.1 to 18.15	1 ¼"
12 mm.	20.7 to 20.8	24.1 mm.	20.9 to 20.95	1 ½"
14 mm.	23.2 to 23.3	28.9 mm.	23.4 to 23.45	1 ¾"
15, 16, and 18 mm.	27.7 to 27.8	32.2 mm.	27.9 to 27.95	2"
20-22 mm.	35.1 to 35.3	40.8 mm.	35.4 to 35.45	1 3/8"

	51.8 to 52.1	60.2 mm.	52.2 to 52.3	2 ¼"
48 mm.	56.1 to 56.4	65.0 mm.	56.5 to 56.6	2 ½"

## SIX OR FOUR CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the paper read by Mr. S. F. Edge before the Automobile Club, I think he was hardly fair in forgetting to mention the relative sizes between the 40-h.p. Napier and the 35-h.p. Renault which he tested. Those sizes are as follows:—Napier 300 C.I.C., Renault 468 C.I.C.

It will readily, therefore, be seen that the four-cylinder Renault, contrary to what Mr. Edge suggested, is considerably lighter than the six-cylinder Napier, proportionately to their size. Accepting Mr. Edge's own scales as being correct, it appears that the Renault engine, developing something over half as much power again, is only 25 lbs. heavier; or again, that with a four-cylinder engine it is possible to get the same power as in a six for two-thirds the weight. I feel sure Mr. Edge will accept my correction and acknowledge the omission in his paper in justice to other manufacturers, and particularly to Messrs. Renault.

With reference to the weight of the radiator, Mr. Edge has omitted to state that the Renault radiator is one peculiar to that firm, and I think again he will admit that he should have weighed his radiator against the honeycomb radiator of an ordinary car, and not a special type of radiator. But, having omitted to do so, I feel sure he will permit me to correct him, in justice to other manufacturers, and I herewith do so:—

Radiator for Napier, 300 C.I.C. ...	lbs. 50
Radiator for Fiat, Itala, Weigel or Mercedes, for engines, roughly speaking, half as big again ...	50

or it appears once more as if the four-cylinder engine only required two-thirds the radiation.

In the various lengths and measurements that Mr. Edge gives he omits the only one of any real interest, and that is the length of the crankshaft. Taking the crankshaft of the four-cylinder type, and not in any way reducing its diameter, although it is one of the claims of Mr. Edge that you can so reduce it, yet I will favour him by not doing so, it will be found that the torsional strain becomes something like seven times weaker by the extra length. It is regrettable that Mr. Edge, in fairness to other manufacturers, left out the only measurement of any utility for them to know.

With the remainder of his remarks I will not deal, inasmuch as they are mere assertions. Trusting that, in fairness to the large number of manufacturers who assert that six cylinders are incorrect, you will publish this letter of correction.—Yours truly,

D. M. WEIGEL.

## THE CONSTRUCTION OF AN INSPECTION PIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the *M.C.J.* of the 9th inst. we notice a letter from Mr. Scarth in reference to motor pits. We see that he advocates 3 ft. as a suitable depth. We have had considerable experience in this matter, as we have several garages and repair shops, and in every case find that 4 feet is the most suitable depth, as a man can certainly work much better standing up than sitting down. If we make any exception to the rule, we always go deeper, as a short man can always put something in the pit to stand

on, whereas a shallow pit would make work almost impossible to a tall man. We might mention that we use, and have supplied to our customers, several corrugated iron pits, and find they are most satisfactory.—Yours truly,

BOTWOOD AND EGERTON.

### SUBSTITUTES FOR PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much interest Mr. Edge's report regarding the trial of Borneo spirit. I have been using it on a Baby Peugeot, and can confirm what he states.

During the recent cold weather I found it difficult to start up from the cold, but I soaked a cloth in hot water, put the cloth on the carburettor and inlet pipe, after which I placed a portion of the hot cloth over the air inlet and the engine started almost directly.

I had occasion to turn the engine off after running about a mile, and found a difficulty in re-starting. Necessity is the mother of invention: I took off my glove, put the inside of it over the air inlet, and off she went. I have repeatedly started the engine in this manner. It shows that the spirit in cold weather requires a little warmth to make it vapourize. I find I can get more power, and my car goes very much better than ever she did, and that she picks up remarkably well.

I am glad to hear Mr. Edge say the Borneo spirit will be cheaper than the other classes. I can only say that a great mistake is being made by the spirit people, as they are throttling the motor-car industry by dear spirit. I now use my car for business purposes only, and have had to forego any pleasure trips owing to the dearth of spirit.

It would not answer to pay 1s. 7d. a gallon for spirit, at least poor folk cannot afford it, and they would inevitably give up their little cars. There seems, however, some hope that this contingency will now be averted. I think this question of cheap spirit is much more important to the motor industry than racing trophies.—Yours truly,

BORNEO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—This letter, giving the results of certain chemical tests which I have made on Borneo spirit, may be of interest, following as it does the publication by Mr. S. F. Edge of certain practical tests which he made on the same spirit. When I first came across this spirit I was struck by its smell, which is exactly that of benzol (or coal tar spirit), and then, in view of its high specific gravity, and of the fact that it required more than the usual allowance of air for its combustion, I wondered whether Borneo spirit could possibly only be an admixture of ordinary mineral spirit (i.e., petrol) with tar spirit. But I know that such admixture could not be commercially possible, owing to the price of the tar product, and so dismissed the idea as absurd. However, I made the usual chemical tests, and my suspicions were confirmed by finding that the spirit contained about 25 per cent. of a liquid which was for all intents and purposes tar benzol.

Similar tests were very kindly carried out by Mr. Wilton, of the Gas Light and Coke Company's Tar Works, and his report confirmed my figures. I was much puzzled to know how, when, and where this proportion of tar benzol had come into the spirit, but happily one day Mr. Hunter, of Messrs. Thompson and Hunter, the well-known oil-well experts, asked my opinion on a remarkable set of tests which they had made of a new grade of crude oil from Russia, and for the source of which they could absolutely vouch, being direct from the earth, without any admixture. This sample showed the presence of "tar" spirit or benzol in the same way as did the Borneo spirit. So evidently in some wells we have a new source of so-called "tar" benzol in quantity; but at the present high prices of petrol it is very unlikely that the industries using such benzol will find its extraction from mineral oil remunerative.—Yours truly,

A. DUCKHAM.

### PETROL IN WALSHALL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is somewhat peculiar that, within a week from the date that I have found out a peculiarity of the town of Walsall, I should read in your columns that this town is anxious to attract the motor industry to its area.

Are your readers aware that it is impossible to obtain a drop of petrol in Walsall between the hours of sunset and sunrise, without the permission of the chief constable? That is to say, that if any motorist is unlucky enough to be stranded in Walsall for want of petrol between these hours, he cannot get a drop of this most necessary fluid without the permission of the chief constable. It is scarcely creditable that in the year 1907 one should be so reminded of the curfew days, but it is nevertheless a fact, and one to which my attention was forcibly drawn when I was delayed in Walsall for over half an hour because the chief constable happened to be out when the request was sent him, and the official in charge in his place refused the permission. It was only by a bit of luck that we happened to chance on someone who was good enough to give us the requisite permission, which I personally doubt if we should have got had we not been backed up by a most obliging Walsall automobilist, and were able to return to Birmingham.—Yours truly,

ALAN A. L. HICKMAN.

### SUBSTITUTES FOR THE HORN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the *M.C.J.* of the 9th inst. a letter signed by S. J. Watson respecting the electric horn, and endeavouring to prove that what I said on this matter was not quite fair. He assumes, amongst other things, that I have only tried one class of electric horn, and that one a cheap variety. Herein he makes a big mistake, for the one I have used was a Wagner. I suppose these are set ready for use. At any rate it was fixed up complete, and so far as sound goes there was nothing to complain about, but when it had been in use about a week it would not work. The sound box was opened and it revealed the fact that the platinum points were burnt or worn away. I endeavoured to take out the two portions of the thing which contained or held the platinum points so as to get them renewed, but found this very difficult, and it had to be sent to the firm who supplied it. They supplied new points. I had it in use again for a few days, when I again had to look at the platinum points, and was surprised to see there was very little left. After this I advertised the horn and sold it for very little.

The above is my experience with the horn which S. J. Watson considers so very good. I have naturally taken an interest in other makes, and can include in my circle of motoring friends some who have tried the cheaper makes. I have not yet found anyone who is satisfied with any make. I notice your correspondent says he is interested in platinum points; well, I am not, neither in bulb horns nor foot bells. I am a motorist, nothing more, and gave my experience and opinion, and S. J. Watson is entitled to do the same, but not to tell others, whose experiences are not like his, that they are exaggerating.

There appears to be one blank space in S. J. Watson's letter; he does not tell us what amount of motoring he does. Is he one of the many week-enders, or does he use his motor for business or pleasure, or both? Because it must make a vast difference to an electric horn, especially if a good amount of motoring is through towns or villages where it is necessary to give alarm every minute or so. The latter is my position,

The 40-h.p. Siddeley Car which is now engaged on a long-distance Trial.

and I shall probably be told that I have used it unnecessarily, but I have not, for, after my first repair bill of 9s. 4d., I calculated that it cost a farthing every time I touched the thing. It amounts to this, with a bulb horn you may give as much alarm as you like, but with an electric you must be careful or it will cost you ever so much.—Yours truly,

J. H. H.

### IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you or any reader of the *M.C.J.* could assist me in arriving at a solution of the ignition difficulty I am experiencing. The engine of my car has two cylinders, the ignition being by trembler coil. In turning the starting handle round slowly the trembler connected to the first cylinder "buzzes" at the correct position, i.e., when the connection is made at the contact maker. As the handle is still revolved, the same trembler ceases to buzz for a moment, but begins again and continues to do so until the trembler is on contact; trembler No. 2 now begins to buzz, and on still turning the handle slowly both stop all right.—Yours truly,

R. J. FENWICK.

[There is probably a shunt circuit in the contact breaker, produced by a shaving of metal becoming embedded in the insulation between the two contacts. This is making a connection to the first contact, and it is probably a slight distance from it, as the false contact does not make the trembler buzz until after it has left the first contact. The contact breaker should first be carefully examined, and especially inspect the edges of the insulation near the outer metallic case, also clean the inside circumference with a piece of glass paper and clean the back of the contact breaker, removing all oil and grease, dust, &c. It can be ascertained if this is the possible cause by inserting a piece of paper for the contact breaker roller to pass over when turning it between the two contacts; that is to say, let it make contact on the first point, and, as it

leaves it to pass round to the second point of contact, let the roller pass over a paper insulation, and note if the coil still buzzes. If it does, the fault will lie in the outside wiring.]

### ACCESSIBILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A correspondent, "Motorist," called attention to the need for the accessibility of details in motor-cars in a recent issue. There is, however, another phase of this question which is also of great import, as upon it depends not only the pleasure but also the comfort of the private user. This is the importance of being able to receive satisfaction from a manufacturer when repairs or renewals are in question. It is remarkable how supremely indifferent to the owner's interests and desires some of these gentlemen become when once the sale has been effected. A case in point is the attitude of the English branch of a well-known French firm, which forms an apt illustration of the difficulty of obtaining accessibility to a maker when occasion arises:—

Time.—Olympia Show, 1906.

Intention.—Purchase of a new car containing a special and well-known engine.

Discussion on defect of same engine in present car.

Result.—Invitation to send engine to works to be overhauled, maker expressing his desire to satisfy customers.

December 5.—Specification and estimate received for £8 17s. 6d.

Verbal acceptance by telephone confirmed by letter same day.

December 7th, 1906.—Alleged error in estimate and refusal to proceed with the work unless £15 2s. 6d. is paid.

December 10th, 1906.—Details of alleged error requisitioned and intimation given same might be recognised.

December 11th, 1906.—Denial of contract by maker and suggesting removal of engine, but no details of alleged error furnished.

December 12th, 1906.—A firm of engineers instructed to get specification carried out, with a suggestion that the maker should do the work, to avoid delay and for the sake of economy.

December 13th, 1906.—Refusal of maker to undertake work, who again desires removal of engine.

December 14th, 1906.—Verbal refusal on same day to do work for the engineers which involved serious question of principle, resulting in an intimation that application to the Court would be made for an order for specific performance of contract.

December 15th, 1906.—Acknowledgment of this intimation.

December 18th, 1906.—Engineers receive estimate for £15 2s. 6d.

January 24th, 1907.—Refusal to allow engineers to attend works to test engine, suggesting ocular examination is sufficient.

January 27th, 1907.—Guarantee as to perfect condition of engine given to avoid actual demonstration.

February 1st, 1907.—Delivery of engine (a small part missing).

It should be mentioned that the person responsible for the above conduct is a M.I.Mech.E. The above discloses the adoption of a very autocratic and unreasonable attitude. The inaccessibility of the maker to the user was presumably on the ground that the user was in the maker's power, the engine in question, as stated, being a speciality. Similar high-handed conduct by the same house has recently come to my knowledge in regard to another motorist, resulting in the discarding of that type of engine and the circulation, only natural, of a bad impression among the large coterie of influential motorists. The chairman of the recent meeting of automobile engineers already referred to by "Motorist" will no doubt agree with the above conduct as being quite consistent with his view that everything should be inaccessible to the private user. Surely the time is opportune for makers to recognise that motorists have some common sense, and should be treated with reasonable consideration and courtesy.—Yours truly,

MOTORIST No. 2.

### THE CARE OF DISC CLUTCHES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Hitherto my experience has been confined to clutches of the leather-faced cone type, but the new car I have on order is to have a multiple disc clutch of the Hele-Shaw pattern. I should be much obliged, therefore, if any motorist who has had experience with the Hele-Shaw would give a few hints as to the care and attention they require to keep them in good working order. The information will, I am sure, prove useful to many besides.—Yours truly,

E. R. FOUNTAIN.

SPYKER CARS.—Mr. Albert House, of Bradford, writes:—"I have been associated with the Spyker cars from the time I brought the first one into England. As, at the request, and with the help of some of the leading dealers in, and users of, these cars, I am compiling a history relating to them, I shall be pleased if some of your readers will send me any photos, or information, that I can use."

SMALL STEAM CARS.—The letter on this subject in our last issue was from Messrs. Norris Bros., Bridge Street, Middlesbrough, who are devoting much attention to the conversion of Locomobile steam cars.

## CLUBS AND ASSOCIATIONS.

### THE AERO CLUB.

THE annual general meeting of the members of the Aero Club of the United Kingdom will be held at 166, Piccadilly, London, W., on Wednesday, the 20th prox., at 5 p.m.

Members are reminded that a ballot paper for the election of eighteen candidates to serve on the committee of the club for the ensuing year will be forwarded to them at least seven days before the date of the annual general meeting. Any two members of the club can nominate a member to serve on the committee, having previously obtained such member's consent. The name of such member so nominated, with the names of his or her proposer and seconder, must be sent to the secretary in writing not less than fourteen days before the annual general meeting. March 6th is the last day for the receipt of nominations. In accordance with the rules, the committee shall consist of eighteen members, who shall retire annually. Retiring members shall be eligible for re-election.

The following retiring members have so far been nominated and have signified their willingness to serve:—Messrs. Griffith Brewer, Ernest Bucknall, Frank H. Butler, Vice-Admiral Sir Charles Campbell, K.C.M.G., C.B., D.S.O., Col. J. E. Capper, C.B., R.E., Capt. Corbet, Martin Dale, Prof. A. K. Huntington, Dr. F. W. H. Hutchinson, M.A., J. T. C. Moore-Brabazon, Hon. C. S. Rolls, J. Lyons Sampson, G. F. Sharp, Stanley Spooner, F. Harold Sully, and Roger W. Wallace, K.C. New candidates for the committee are Messrs. A. Leslie Bucknall, C. F. Pollock, P. Paddon, C. C. Phillips, and Viscount Royston.

### THE INSTITUTION OF AUTOMOBILE ENGINEERS.

A COUNCIL meeting of the Institution of Automobile Engineers was held at the Institution of Mechanical Engineers on Wednesday of last week, when the Chairman (Col. R. E. Crompton) announced the loss the Council had sustained by the decease of Mr. O. P. Clements, who had been connected with the institution from its inception. On the proposition of Mr. Dugald Clerk, seconded by Mr. A. E. Tucker, it was resolved that the following be and are hereby entered in the Articles of Association as the first members of the Council:—Messrs. Herbert Austin, E. E. Baguley, W. Worby Beaumont, T. B. Browne, Dugald Clerk, F. C. A. Coventry, Alex. Craig, J. S. Critchley, R. H. Fowler, Alec Govan, C. R. Garrard, Dr. H. S. Hele-Shaw, A. S. Hill, Henry Lea, Douglas Leechman, E. W. Lewis, F. W. Lanchester, Charles Marston, Percy Martin, F. L. Martineau, Douglas Mackenzie, John S. Napier, M. O'Gorman, T. C. Pullinger, Victor Riley, Archibald Sharp, D. J. Smith, A. E. Tucker, Charles Wheeler, and T. H. Woollen.

It was reported that Professor H. L. Callendar had promised to read a paper before the Institution on "The Effect of Size on Economy of Motors" on Wednesday, May 15th, 1907.

Mr. Ernest Latham's report on nuts, bolt-heads, and accessories was considered, and it was resolved to form a Standardisation Committee, consisting of Colonel R. E. Crompton, Messrs. H. Austin, J. S. Critchley, C. R. Garrard, Henry Lea, F. L. Martineau, T. C. Pullinger, A. Sharp, and Chas. Wheeler, to consider and report.

LAST week's meeting of the Institution of Automobile Engineers was devoted to a study of the strength and structure of alloys, under the direction of Mr. Walter Rosenhain, of the National Physical Laboratory, who urged the close connection between metallurgy and the motor industry as being well emphasised by the fact that a leading French metallurgist, Dr. Guillet, has been long associated with a leading motor-car firm. The point of view from which the engineer is chiefly interested in the structure of metals was that of their strength, the factors concerning which were then dealt with in a thoroughly scientific manner.

### THE MOTOR VAN, WAGON AND OMNIBUS USERS' ASSOCIATION.

A MEETING of the Executive Committee of the association was held at 1, Albemarle Street, Piccadilly, W., on Wednesday of last week.

The memorandum of the scheme for the probationary inspection of members' vehicles was considered and approved with slight modifications. The question of the fee for preliminary advice was considered, and it was resolved that this should be reduced. It was reported that a circular had been sent to those members resident in the Glasgow district, stating that one of the association's authorised engineers would make a circular inspection tour during the week commencing March 4th, 1907, and it was resolved that, whatever the response, the engineer was to make the inspection.

A letter was read from the Town Clerk of Kensington, with regard to a resolution passed at the conference of the representatives of the

Metropolitan Borough Councils, that owners of motor-wagons were urged on the desirability of their using india-rubber or other noiseless material on the tyres of the wheels of motor vehicles, and it was resolved that a reply be sent stating that the association agree with this resolution, and prominence to the matter would be given in the journals recognised by the association.

The terms of the new Draft Cab Order were considered, and it was resolved that this should be referred to Mr. W. Hodges, of the City and Suburban Motor Cab Company, Ltd., and he be asked whether he has any suggestions to make with regard thereto through the association.

Executive Committee.—The following candidates were nominated for election upon the Executive Committee for 1907:—Messrs. G. Arnold (Tunbridge), L. H. Baxendale (London), Capt. W. Bagnall-Wild (London), E. R. Calthrop (London), F. C. A. Coventry (Slough), J. L. Farmiloe (London), H. Howard Humphreys (London), W. G. Lobjoit (Hounslow), Douglas Mackenzie (London), D. H. Simpson (Manchester), James Scott (London), W. H. Wilcox (London), and Charles Wheeler (London).

The members of the existing committee who remain in office for another year are:—Messrs. Arthur J. Clay (Burton-on-Trent), W. Dalziel (Glasgow), S. D. Gilbert (London), Dr. H. S. Hele-Shaw (London), H. Thomson Lyon (London), J. C. Mitchell (London), L. G. Oldfield (London), A. Patterson (London), R. R. Robbins (Viewsley), and A. A. Campbell Swinton (London).

### AUTO-CYCLE CLUB.

A COMPETITION for motor-bicycles is to be held by the Auto-Cycle Club in the Isle of Man about the same time and over the same course as the race for the Tourist Trophy cars. A petrol allowance of a gallon for every ninety miles will be given, and the capacity of any one cylinder must not exceed 500 cubic centimetres volume swept out by the piston per stroke. Unless twenty entries are received by May 20th the event will not be run. Mr. S. F. Edge has offered a prize for the best performance by a British subject on a British machine in this contest.

### LINCOLNSHIRE MOTOR-CYCLE CLUB.

At last week's meeting of the committee eleven new members were elected, giving this new club a membership of over 200. The season is to be opened by a meeting at The Shades, Spilsby, on Good Friday, dinner at 1 o'clock, after which a general meeting of members will be held, followed by a meeting of the committee. On Easter Monday a hill-climb will be held at North Carlton. On Whit-Monday there will be a reliability trial, and on July 4th a meet with the L.A.C., at which there will be a hill-climbing competition, for prizes offered by the L.A.C. Mr. Morley's invitation to the club at Leadenham was accepted, and a hill-climb will be held. Meets will probably be held at Cleethorpes and Skegness, among other places. The affiliation question was discussed, and a number of letters were read. The feeling was against any material increase in the fees, and in favour of the Auto-Cycle Club being on a better basis.

### LINCOLNSHIRE A.C.

MAJOR J. A. COLE has been re-elected chairman of the club, and Mr. A. A. Padley vice-chairman. A grant of £5 has been made towards the tar-spreading competitions. It has been decided to have a hill-climbing competition in the Wolds on June 15th, with one class for private members of the club and another for all members. On June 22nd, the Saturday before the Royal Show, Dr. Husband will entertain the members at Crowland. On July 4th there is to be a joint gathering with the Lincolnshire Motor Cycle Club and hill-climb for motor-cyclists, the prizes being given by the Lincolnshire A.C. In July Dr. Gilpin's motor assembly at Grimsthorpe is to be held, and in August the Syston hill-climb will take place, as well as Mr. Godson's party at Asgarby. Grimsby is also to be officially visited during the season.

### NORTH-EASTERN AUTOMOBILE ASSOCIATION.

THE annual meeting of this association took place at the County Hotel, Newcastle-on-Tyne, on Friday of last week, when about forty members were present. In the absence of the President, Sir Lindsey Wood, Bart., through illness, Mr. W. E. Rogerson, of Darlington, occupied the chair.

The annual report was taken as read, and the recommendations of the committee contained in it were discussed in detail. With regard to the affiliation of cycle clubs, it was decided that the principle of reduced fee should be agreed to, and the fixing of the actual amount was left in the hands of a small committee, who were to correspond with the Motor Union. A further alteration in the rules which was agreed to provided for the collection of subscriptions from individual members by the hon. secretary, the old plan having been to leave this matter in the hands of the district secretaries, which involved some confusion and unnecessary expense.

The question of allowing gentlemen interested in the motor trade to hold office in the Association was considered at length, and it was finally decided to alter the rule No. 4 to read that "members whose livelihood principally depends upon the sale of motor vehicles or their accessories shall not be eligible for office."

The retiring president and vice-presidents were re-elected, also Captain Streatfeild, chairman, Mr. J. E. Hodgkin, hon. secretary,

Mr. J. C. Squance, hon. auditor, Mr. J. A. Williamson, hon. solicitor. The following gentlemen were elected representatives to the Motor Union Committee for the current year:—Captain Streatfeild, Captain C. Morison-Bell, Messrs. R. B. Hoare, J. E. Hodgkin, J. Nettrass, J. H. Pease, C. E. Smith, R. Hodge, A. N. L. Wood, and F. C. Wilson.

On the motion of the Chairman, a grant of fifteen guineas was voted to the Road Tarring Competition which is being organised by the Motor Union and the Automobile Club.

The Hon. Secretary proposed a vote of thanks to those officials of the County Council and other public bodies who had assisted the Association during the past year. As an instance, Mr. Hodgkin quoted the recent action of the Durham County Council in agreeing to the erection of over seventy warning triangles at dangerous corners and hills, these having been recommended by the committee. This was carried with acclamation.

### BRITISH MOTOR BOAT CLUB.

THE annual general meeting of the club will be held at the Craven Hotel, London, on Thursday next.

The fixture list for the forthcoming season has not yet been definitely settled, but the following may be mentioned:—Whit Tuesday (21 May) on Oulton Broad, races and gymkhana, a long distance race in July, races at Cowes on August Bank Holiday (Monday, Aug. 5), and on Tuesday (Aug. 6); other fixtures will also be made, of which further details will be given later.

### THE JUNIOR AUTOMOBILE CLUB.

UNDER the above title a new club has been registered. The membership will be limited to 500, and the annual subscription has been fixed at one guinea. This new organization will arrange endurance tests, hill climbs, tours and club runs for its members. The hon. sec. is Mr. S. C. Darrington, Oakthorpe, Brownlow Road, New Southgate, N.

Caricatures of some well-known French motor traders by "Mich," in "l'Auto." Leading from left to right they are M. Gobron, M. A. Clement, and M. Michelin.

### HEREFORDSHIRE.

THE Frome's Hill Climbing Competitions of the Herefordshire A.C. will be held on May 3rd, followed by a dinner and concert at the Mitre Hotel, Hereford. Mr. J. T. Hereford will be the judge, Mr. J. W. Orde the marshal, and Mr. Wilfred Groom the secretary of the meeting.

The contests are open to touring cars with internal combustion engines whose cylinder diameter in inches, squared and multiplied by the number of cylinders, does not exceed 125. The entrance fee for each car shall be £2 2s., which must accompany the form of entry and reach the hon. sec., Mr. Groom, Wroxeter, Hereford, on or before April 18th, 1907. Post entries will be received up to April 22nd at a double fee.

#### CLASSES.

- |    |  |
|----|--|
| 1. | Cars whose cylinders D <sup>2</sup> N is under 35. |
| 2. | do. do. is 35 and under 50.                        |
| 3. | do. do. do. is 50 do. 65.                          |
| 4. | do. do. do. is 65 do. 90.                          |
| 5. | do. do. do. is 90 to 125 inclusive.                |

D<sup>2</sup>N=diameter of cylinders squared and multiplied by number of cylinders.

Cars in class 1 may compete as two-seaters, but in classes 2, 3, 4, and 5 all cars must be fitted with four-seated bodies, and must carry their full complement of passengers, seated in a fair manner.

The distance to be covered (from the upper gate-post of gate on right side of Frome's Hill, starting from Ledbury and Bromyard main road, to cyclist's danger board at top) is 3,867 feet, and will be timed from a standing start to a flying finish. The total rise is 344.61 feet, the average gradient 1 in 11.22, at the steepest part it is 1 in 6.37.

THE suggestion of the Northamptonshire A.C. with regard to the classification of repairers is to be further considered at the next meeting of the Touring Committee of the A.C.G.B.I.

MR. S. J. SEWELL, 27, Chancery Lane, London, W.C., has had a satisfactory response to his suggestion with regard to a new motor-

car club, and will shortly convene a meeting of those interested in the project.

£400 has been offered to the Institution of Mechanical Engineers for awards for papers on Cycling and Road Locomotion.

The statutory general meeting of the shareholders of the Motor Union Insurance Company, Ltd., will be held on Monday next.

The Stratford-on-Avon Motor-Cycling Club has been formed, with Mr. G. S. Ashfield, of the Unicorn Hotel, Stratford-on-Avon, as hon. sec.

THE address of the newly-formed Dustless Roads Committee, of which Mr. Douglas Mackenzie is the secretary, is 109, Victoria Street S.W.

THE Marquis de St. Mars has been invited to become President of the Ulster centre of the Motor-Cycle Union of Ireland, which has arranged an attractive programme of events for the season.

MR. A. G. RENNIE is the secretary and treasurer of the newly-formed Glasgow and West of Scotland Motor Traders' Association, of which Mr. James Gibbon, of the Glasgow Motor-Car Company, is the president.

## CASES UNDER THE MOTOR-CAR ACT.

### EXCEEDING LEGAL LIMIT.

In the Northern Police Court at Dublin, Michael Travers has been charged with having on Sunday, January 27th, driven a motor-car on the main road, Phoenix Park, at a rate exceeding the statutory limit of twenty miles an hour. Mr. Tobias, who prosecuted, pointed out that the

"Washing Day" at the depot of Argylls London, Ltd., in Newman Street, W. A view of the busy scene on the roof, showing the new premises at the rear—garage, schoolrooms, and fitting shops.

main road in the park came within the definition of a public highway, and no one could legally exceed the twenty miles an hour pace on it. Constable Smith (44 D) deposed that on the date named he saw the car, which was numbered IU 2, travelling towards the city along the park main road at the rate of about thirty miles an hour. He saw it run over and kill a dog without slowing down. After hearing the evidence, the magistrate, Mr. Mahony, was of opinion that the car was going at an excessive speed, that it was going more than twenty miles an hour. He imposed a fine of £5. None of the gentlemen in the car had thought it worth while, when they ran over the little dog, to stop and apologise to the owner. It was conduct like that which caused hostility to motor-cars and motor-drivers.

### RECKLESS DRIVING.

The sequel to a serious accident caused by a motor-car has just been furnished at the Spelthorne Sessions, when Clarence Albert de Vaudrey Glentworth, of London, was summoned for driving a racing car at Haleham in a manner dangerous to the public. The prosecution was undertaken by the police, although there were no police witnesses. The Bench convicted, and fined the defendant £15 and costs.

At Shoreham Petty Sessions, on Monday, Leslie Adlard, a London motorist, denied driving a car at a speed dangerous to the public and not stopping when requested by a police constable, at Southwick, on October 30th last. P.C. Brett stated that about 4 p.m. on the day in question he was standing at the bottom of Rock Road, Albion Street, Southwick, when he observed a motor-car approaching from the direction

of Brighton at a high rate of speed. Considering the speed very dangerous, he went into the middle of the road and put up both hands. The driver then appeared to do something to the car, which came towards him at a faster rate than ever. Witness jumped out of the way very quickly and shouted, but the car dashed past him, smothering him with mud from head to foot, at a speed nothing less than thirty-five miles an hour, in his opinion. It continued at that speed until it got out of sight. A gentleman, whom he believed to be the defendant, was driving, and there were others in the car. The front plate was quite covered with mud, but he saw two "ones" at the rear. He identified the car as one he had previously seen pass on October 14th, 1906. He was present at an interview with the defendant on February 4th, when he (defendant) admitted having been driving on that day. Summonses had been taken out against defendant, but they had not been able to find him for a long time. After the evidence for the defence the magistrate said defendant would have to pay £10 and 16s. costs, also £1 17s. 7d. witnesses' expenses and £1 1s. advocate's fee, or two months for the first offence, and £5 and 10s. costs, or one month, for the second offence.

### A QUESTION OF DEPOSIT.

BEFORE Mr. Justice Kennedy and a common jury, Captain John Newman, who contested the South-East Essex Division at the General Election, brought an action to recover from Messrs. Straker and MacConnell (Limited), motor-car dealers, £258 6s. 8d. paid as a deposit for a motor-car, or damages for breach of contract. Defendants alleged that they were entitled to the deposit under the terms of sale, and denied that they were guilty of breach of contract.

Captain Newman stated that being a candidate for Parliament in 1905, and anticipating that a larger motor-car than the Mercedes he then possessed would be useful during the following session, he ordered, on November 29th, a 40-h.p. Bianchi landaulet car from the defendants, at the price of £775, stipulating that it should be ready by the middle of February. He paid the amount now claimed as deposit, and the remainder of the purchase money was due on delivery. The car was not ready by the time fixed, and he then agreed that it should be delivered about the end of March. Again he was disappointed, the reason given being that there was a strike in Milan, where the chassis was being made, but a promise was made of delivery on April 30th. On May 21st he called at the defendants' place, and was again told that the chassis had not arrived. As it would take a month to complete the car after the arrival of the chassis, and the season would then be half over, and as the car would not be suitable for use in Ireland, he decided not to wait any longer, and cancelled the order. On July 7th the defendants wrote saying the chassis had arrived, and asking for the balance of the account, but he refused either to pay or to accept the car, and asked for the return of the deposit. This was refused and action commenced.

Mr. Rawlinson, in defence, stated that the original arrangement, agreed to by the plaintiff, was that the car should be delivered by the middle of March, not the middle of February. When the car was not ready the plaintiff came and said he had altered his plans, and the defendants might let any other customer have the car and he would take delivery later of another car. He was then aware that he was liable to lose his deposit. As a matter of fact, the chassis was at the works on March 1st. According to his wish, this particular car was then sold to another customer, but in May, having failed to sell his Mercedes car, he asked to be relieved of his promise to take later delivery and wanted to cancel the order, to which the defendants objected.

Ultimately the jury gave a verdict for the plaintiff for the amount claimed.

### ROAD REPORTS.

**WORTHING.**—Several main roads have just been under repair, including Tarring Road, which leads from West Tarring to the railway station at Worthing.

**CUCKFIELD.**—The lowering of Ambrose Hill, on Twineham Green road, is now completed, but the new formation will not for some time bear heavy rolling. The surface will, in consequence, be somewhat rough for a little while, as motorists will soon discover.

**WILTSHIRE.**—Mr. Dryland, the county surveyor of Wiltshire, regards the fast, light motor traffic as a great factor in the cost of the maintenance of the roads. He believes that the life of roads would be largely increased if the macadam were impregnated with bituminous binding. Apparently the condition of the roads in Wiltshire is to be a matter of controversy in the county council election there, Mr. Maurice Hewlett, the novelist, who is opposing Lord Pembroke, at Wilton having described them as "quagmires in winter and rookeries in summer."

**CAMBRIDGE.**—Mr. Harry, the borough engineer and surveyor of Cambridge, estimates that motor traffic has reduced the life of macadam roads by 30 to 40 per cent., wood paving being equally affected.

### POLICE TRAPS.

POLICE traps have lately been observed on the Brighton road near Lewes.

## THE EDINBURGH MOTOR-CAR SHOW.

THE tenth annual motor and cycle exhibition was opened in the Waverley Market, Edinburgh, on Friday last week, and the organisers are to be congratulated on having got together a representative collection of cars. Scottish manufacturers are of course well represented, the Argyll, Albion, and Arrol-Johnston each having a large stand. The display of the Albion Motor-Car Company comprises a 24-h.p. four-cylinder chassis, a landaulet of similar power, the bodywork being by Messrs. J. Henderson and Co., Glasgow; a 16-h.p. chassis, and a 16-h.p. fifteen seated char-a-banc, with fixed roof. A number of Albion cars are also staged by Messrs. A. Donaldson and Co., Edinburgh. The Caledonian Motor-Car Company, Ltd., Aberdeen, in addition to the Paterson detachable flange rim, recently illustrated in the M.C.J., have on view several Peugeot cars, and a 6½-h.p. Friswell two-seated vehicle. Messrs. Humber, Ltd., show examples of the 15-h.p. and 20-30-h.p. Humber cars, including a six-seated landaulet. The Scottish Automobile Co., Ltd., have a full range of the Daimler cars, while a 16-24-h.p. Vinot chassis, with high-tension magneto and Krebs automatic carburettor, is displayed by Mr. David Drover, of Leith. One of the largest stands is that of Messrs. John Croall and Sons, Edinburgh, who are exhibiting De Dietrich, Mercedes, Berliet, De Dion cars, and one of the 9-h.p. Sizaire-Naudin vehicles, the British agency for which Messrs. Jarrott and Letts have just secured. Love's Automobile Co., Kirkcaldy, stage a number of the Dennis worm-drive cars as well as examples of the latest types of Swift and Argyll vehicles. The Rossleigh Motor Company, Ltd., have on view quite a large number of cars, including Napier, Siddeley, Argylls, and Alldays. Examples of the latest types of Argyll and Delaunay-Belleville cars are to be seen at the stand of the Western Motor Company, Glasgow. Messrs. Thomas

Hutchinson, Dunlop, Gaulois, and Bates and Palmer. The exhibit of the Palmer Company is an interesting one, comprising as it does a couple of machines in operation showing how the Palmer Cord tyres are manufactured. The show closes to-day (Saturday).

## COMPANY NEWS.

## NEW COMPANIES REGISTERED.

**UNITED MOTOR CAB COMPANY.**—The prospectus of this company has been issued. The company will take over the Unic cabs now running, and will place on the streets an additional number of Unic and Darracq cabs, working in conjunction with the General Motor-Cab Company.

**COLES MOTOR SPIRIT SYNDICATE.**—£1,000. To acquire from S. O. Cowper-Coles the benefit of an application for patents relating to improvements in the production of petroleum compounds with low-flashing points. 61 and 62, Gracechurch Street, E.C.

**JUNIOR AUTOMOBILE CLUB.**—Limited by guarantee. 500 members. Liability 5s. As title. Managed by executive committee.

**CHARLES WICKSTED AND CO.**—£30,000. To acquire the business carried on at Kettering by Mr. C. Wicksteed, and to carry on the business of ironfounders, mechanical engineers, &c.

**UNIVERSAL MOTOR AND GENERAL INSURANCE CORPORATION.**—£100,000. To carry on motor and general insurance business (life assurance excepted). First directors: Messrs. S. Harden (managing director), W. A. Hartley, J. Crooks, J. B. Glenn, A. Beattie, J.P., D.L., and A. C. MacLaren. Moorgate Station Chambers, E.C.

**TRANSPORTS AUTOMOBILES DES CEVENNES.**—£20,000. To acquire all or part of the business carried on by the Societe Transports Auto-

General View of the Edinburgh Motor Show.

Shaw, Dundee, Ltd., have a varied exhibit, comprising as it does Ariel, Wolseley-Siddeley, De Dion, Swift, Napier, and Humber vehicles. Wolseley-Siddeley, Panhard, and Mercedes cars comprise the display of Messrs. Rennie and Prosser, Ltd., Glasgow. Mr. William Flint, Edinburgh, displays Talbot, Argyll, and Swift cars. A 14-16-h.p. North British double phaeton is included in the exhibit of Mr. A. C. Penman, Dumfries. Other pleasure cars on view include the Alldays, Spyker, Airex, Hotchkiss, Vulcan, Sunbeam, Reo, Chenard-Walcker, Arrol-Johnston, Deasy, Adams-Hewitt, Clement, Rover, Cadillac, Iris, Maudslay, Renault, Austin, and Gladiator. As regards industrial vehicles, the Scottish Motor Engineering Co., Ltd., Granton, display a 30-35-h.p. double-deck motor-bus. The engine comprises four separate cylinders, and the transmission is through a three-speed gear-box and side chains. Halley's Industrial Motors, Ltd., Glasgow, are present with a chassis of a 20-h.p. 2-ton petrol motor lorry. Messrs. D. Stewart and Company, Ltd., Glasgow, exhibit one of the latest Stewart-Thornycroft 5-ton steam wagons.

The accessory exhibitors include Messrs. Alfred Dunhill, Ltd., who have their usual varied display of "motorities," Messrs. Moebius and Son, Stoke Newington (oils and greases), the County Chemical Company, Ltd., Birmingham (vulcanisers, sparking plugs, &c.) Price's Patent Candle Company, Ltd. (oils and greases), Messrs. W. Anderson and Sons, Edinburgh (motor clothing), Messrs. W. Barton and Sons, Edinburgh (accumulators), Messrs. James Thomson and Sons (Bleriot lamps, Smith's speed indicators, Parsons non-skids, Harvey Frost vulcanisers, &c.), Messrs. Jones Bros., Ltd. (Selvyt), Messrs. Croall and Croall (autoclipse lamps), Messrs. Middleton and Townsend, Edinburgh, who display a new magnetic clutch and also a magnetic change-speed gear. The tyre exhibits comprise the Continental, Clincher, Elastes,

mobiles Des Cevennes, of Alais, France, relating to automobiles. First directors: Messrs. P. Marchais, P. Legall, and R. Starke. 20 shares. 195, Upper Thames Street, E.C.

**LLANDUDNO AND TREFRIW MOTOR BOAT COMPANY.**—£5,000. To acquire from the Llandudno and Trefriw Steamship Company, Ltd., certain of its property and rights, and to build a motor-boat for traffic between Llandudno and Trefriw. First directors: Messrs. R. Conway, R. Dunphy, A. Hewitt, H. Hughes, W. E. Jones, T. C. Lewis, and F. Nunn. £50. 26, Mostyn Street, Llandudno.

**F. HOPPER AND CO.**—£50,000. To acquire the business of Messrs. F. Hopper and Co., and to carry on the business of manufacturers of and dealers in motor-cycles, motor-cars, &c. First directors: Messrs. F. Hopper (permanent managing director), H. Wilson (permanent), W. Tomlinson, and G. H. Nowell. Brigg Road, Barton-on-Humber, Lincolnshire.

**MOTOR AUCTIONS.**—£100,000. To adopt an agreement with Mr. C. H. Newman relating to the acquisition of underleases of certain premises in London and to the erection of buildings thereon, to establish and maintain garages for the auction, storage, and repair of vehicles, &c. First directors: Messrs. H. A. Arkwright, J. W. Davy, U. Stratton, J. E. Hutton, S. F. Edge, J. B. Martin, and P. W. Northley. 123, Pall Mall, S.W.

**LORRAINE DE DIETRICH.**—£100,000. To carry on the business of motor-car, landaulet, cab, omnibus, and van proprietors and manufacturers. 45, Great Marlborough Street, London.

**STAINES MOTOR COMPANY.**—£5,000. First directors, Messrs. H. H. Clark, P. E. Hubbard, and A. F. Oliver. 1, London Road, Staines.

**VALVELESS.**—£16,000. To take over the business of a motor garage keeper carried on by Mr. R. Lucas at 191, Westcombe Hill, Blackheath,

S.E., and to acquire the benefit of certain existing inventions. No initial public issue. First directors: Messrs. R. Lucas, H. Juler, and K. Lucas.

### COMPANY MEETING.

THE STEPNEY SPARE MOTOR WHEEL, LTD., held its statutory meeting on Monday, at Salisbury House, London, E.C., with Mr. W. B. Jessopp presiding. He said the total number of shares allotted was 40,050. The company took over the profits as from September 23rd last, and up to December 31st they amounted to £4,855. The directors had arranged with Messrs. Davies Brothers that they were to retain the French and Belgian rights for £20,000, thus reducing the purchase-money from £95,000 to £75,000, as to £2,500 in cash and as to £17,500 in shares of this company, reducing the vendors' shares to be allotted from 65,000 to 47,500. The capital of the company under the amended agreement would stand at £87,550, out of which there would be paid to the vendor £75,000, less the £4,855 profits from September 23, leaving, after deducting the underwriters' commission and preliminary expenses, £15,755 for working capital. In the supplementary agreement an important advantage had been gained for the company. The original agreement did not provide for the company acquiring improvements or additions to the patents that might be brought out by Messrs. Davies. Since the original agreement was entered into, Messrs. Davies Brothers had patented improvements, and it had now been arranged by the supplementary agreement that the company would have the benefit of all those improvements. To put it shortly, the amended agreement had enabled the directors to dispose of these foreign rights for £20,000, and at the same time they had taken the opportunity of acquiring for the company all Messrs. Davies' present and future improvements of the patents. He thought 1907 would be a great year for the Stepney spare wheel, of which 1,020 had been sold in January. The motion for the adoption of the directors' report having been proposed by the chairman, Major J. A. Cole, J.P., seconded the resolution, expressing his high opinion of the speciality of the company. The resolution was carried and a vote of thanks passed to the chairman and directors.

### THE POSITION OF THE AUTOMOBILE "AS YET."

LAUDABLE efforts on the part of foreigners to translate trade catalogues into other languages are not uniformly successful; sometimes they are even amusing, and the following preface from the English catalogue of a foreign firm now seeking business in this country may occasion a smile:—

A glance at the number of motor-cars, at all events not very long acquainted to our sight, will readily suggest the opinion that the manufacture of motor-cars has developed in an extremely quick and even surprising manner. Upon a closer view, however, this opinion will not prove right on account of the high rank of our machinery-manufacture, on the contrary we might wonder at the motor-car not having far more worked the wagon drawn by horses out of its place, in spite of its enormous advantages. This is sure to happen within a measurable space of time. But it seems almost inexplicable that not already in the present time the vehicles of war are driven by motors, that not already now an extension of rail-tracks, in street traffic at least, are considered improper. It is a striking fact that the cabs are not decreasing in number and the motor-cabs increasing too slowly. If the manufacture of automobiles really had reached a degree of development corresponding with our other machinery-manufacture, a great number of business and private people would have replaced their spans of horses by an automobile without mentioning that it only needs a small space, while the chauffeur can be employed for other purposes. The simplicity of handling a motor-car, as well as its absolute reliability and the easiness of its being kept in good order even by a non-professional, have to render a special chauffeur superfluous. If this is not the case it is really not the fault of a natural caution of the party concerned or want of capital, but the up-to-date motor-car not being of a satisfactory quality yet. Of its working parts the motor only is constructed, though not with thorough perfection, but at least to meet satisfaction as yet.

### MOTOR INSTRUCTION IN ROYAL PARKS.

At the Kingston-on-Thames County Police Court on the 14th inst., Herbert Peach, of Arlington Mansions, Turnham Green, was summoned for giving instruction in the driving of a motor-car in Richmond Park on February 1st, and Frederick Coombs, of Norfolk Crescent, Hyde Park, was summoned for using a motor-car for such instruction, contrary to the provisions of the Parks Regulation Act. Defendants admitted the offence, but pleaded ignorance of the regulations. The Chairman (Mr. W. Y. Cockburn): According to the regulations you are not allowed to receive instruction in motoring in Richmond Park. Park-Sergeant Gattrell added that the regulations laid down that it was illegal to either instruct or receive such instruction in Richmond Park, which is one of the Royal parks. The Chairman said that as that was the first case of the kind heard at that court the summonses would be dismissed on payment of the costs.

### PUBLIC MOTOR SERVICES.

A NEW motor-car, belonging to the Harrogate Road Car Company, is now running between Station Square and Bilton.

THE Watch Committee of the Chester Town Council have inspected two of the vehicles which are to form part of the fleet of motor-cabs it is proposed to place on the streets of the city.

A FEW days ago twenty-eight motor-buses in service in London were declared by the officials of New Scotland Yard to be noisy beyond the ordinary allowance for traffic, and taken from the streets. Naturally the owners have expressed surprise, and it is understood that a second test has been made, this taking place on Wimbledon Common.

### BUSINESS NEWS.

THE Ranger Moor Company, Victoria Street, Christchurch, have been appointed New Zealand agents for the Dennis cars.

IN the London Road, Redhill, and also in the Croydon Road, Reigate, Messrs. Wilker Bros. have facilities for the repair of motor-cars, the charging of accumulators, and the vulcanising of motor tyres.

MESSRS. J. B. HARGUSON AND CO. will shortly establish motor-car show rooms in Chichester Street, Belfast.

MR. A. E. MADR, of Reading, has taken up an agency for the Weigel chassis.

MESSRS. JARROT AND LETTS have received an order from His Grace the Duke of Sutherland, K.G., President of the Automobile Club, for a 30-40-h.p. Crossley, fitted with a single limousine body. The car will be arranged for the Duke to drive himself, while at the same time full protection is given from the weather in the same way as is afforded in an ordinary covered-in limousine.

AMONG many others, the following notabilities have recently purchased Humber cars for their personal use:—Hon. Mrs. Luborly, of Gayner Hall, St. Neots; Count de Serra Largo, Hon. C. Selater Booth, and Sir M. Chomeley Bart., of Norton Place, Lincs.

MESSRS. S. F. LODGE, LTD., inform us that eight completed six-cylinder Napier cars were dispatched to customers on the 13th inst., their total value being £9,359. The destinations of some of these were very far apart, as shown by the following list:—A 40-h.p. landaulet for Messrs. Marks and Co., of Bombay; a 40-h.p. touring car for Messrs. Saker and Co., Johannesburg; a 40-h.p. touring car for Mr. R. B. Beddingfield, of Roehampton; a 40-h.p. chassis for Messrs. Ashworth, Taylor and Co., Calcutta; a 60-h.p. car for Mr. J. Fitter, of Birmingham; a 40-h.p. chassis for Messrs. Thomas Shaw, Ltd., Dundee; a 40-h.p. chassis for Messrs. Gimshaw and Sons, of Sunderland; and a 40-h.p. landaulet for Mr. J. H. Love, of Bowls, Essex.

THE Sirdar Robber Co., Ltd., have addressed a letter to their customers calling attention to the Prevention of Corruption Act, and hoping to secure their co-operation with a view to the carrying out of the spirit of the new legislation.

MESSRS. BROWN BROS., LTD., have appointed Messrs. Morrison and Sons, of Jane Street, Leith, as their Edinburgh agents for the "Brown" motor-car.

MESSRS. KELL AND BEARD would be glad to show cards of motor-cars, tyres, and accessories for their new garage at 38, East Street, Farnham, Surrey.

AMONG the preparations which are finding favour among motorists for cleaning the metalwork of their cars that known as "One Minute" polish, introduced by Messrs. H. Fleming and Co., Ltd., 361-3, City Road, E.C., is having a wide vogue. It secures conspicuous brilliancy with little labour, while the durability of the polish when secured is another merit of importance.

MR. W. WILKS has joined the Waterloo Motor Works, of Chicheley Street, York Road, London, S.E.

THE Henry Wells Oil Company, of the Imperial Oil Works, Manchester, have removed to larger works at Salford. These have an area of about ten times that of the premises lately vacated.

THE Directorate of the Rover Company, Ltd., Coventry, will in future consist of Sir Frederick Dixon Dixon-Hartland, Bart., M.P., Mr. A. H. Griffiths, Col. E. F. Hyley, and Mr. J. K. Starley, in addition to the managing director, Mr. Harry Smith.

MESSRS. H. WILKINSON AND SON, automobile engineers and agents, of 186, High Street, Uxbridge, have purchased the business and stock in trade of Messrs. Dayrell and Groombridge recently carried on at 54, St. Andrew's and known as the "Uxbridge Garage." They will be able to execute motor engineering repairs, accumulator charging, tyre repairing, vulcanising, &c. These premises will be used as a garage, and all work entrusted to the firm will have personal supervision.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.
